E-mail: hamida.zouaoui@univ-msila.dz , Orcid: https://orcid.org/0009-0008-0982-5515

Issue web link https://imcra-az.org/archive/385-science-education-and-innovations-in-the-context-of-modern-problems-issue-11-vol-8-2025.html

Keywords Agile management, changing business environment, business challenges.

Abstract

This article explores agile management as a strategic approach to addressing the challenges of a rapidly changing business environment. It begins with a theoretical overview of the concept of agile management and its core principles. It then examines the characteristics of today's business landscape and the increasing complexity of the challenges it presents. The study analyzes the interaction between agile management and these challenges by showing how leading organizations have adopted agile principles to respond effectively to technological change, globalization, economic volatility, shifting consumer preferences, regulatory pressures, talent shortages, cybersecurity risks, sustainability demands, supply chain disruptions, and digital reputation crises. Real-world examples, alongside simulated case studies, are used to illustrate the practical impact of this methodology. The study concludes that agile management can transform crises into opportunities by reducing development cycles, increasing responsiveness, and lowering costs. This makes it a powerful tool for enhancing competitive resilience in dynamic markets.

INTRODUCTION

In recent decades, the business environment has undergone unprecedented change, marked by growing complexity and acceleration. This shift is driven by major factors such as digital technology, the Fourth Industrial Revolution, demographic transitions, and the rise of global crises like pandemics and climate disasters. These conditions have created a climate of uncertainty, continuous disruption, and time pressure. As a result, traditional management models—based on long-term forecasting and fixed planning—have struggled to keep pace with this evolving reality. There is now a pressing need for management approaches that are flexible, adaptive, and capable of responding quickly to repeated challenges.

In response to this need, agile management has emerged as a leading contemporary framework that redefines how projects, resources, and teams are managed within organizations. It has evolved beyond its roots in software development to become a comprehensive organizational philosophy. Its foundations lie in

collaboration, iteration, continuous improvement, and decision-making driven by real-time feedback. Agile practices have proven effective in helping organizations test innovations rapidly, shorten time-to-market, and achieve measurable outcomes within short cycles.

Practical experiences from real companies, as well as simulated analytical scenarios, have shown that agile management is no longer a performance-enhancing option, but a strategic necessity for survival and growth in today's fast-changing business environment. Many organizations have expanded agile practices beyond isolated departments to encompass core operations, organizational development, supply chains, regulatory engagement, and customer interaction. Accordingly, this study seeks to explore in detail the relationship between agile management and the shifting business environment, and to show how this approach can serve as a strategic tool for adapting to sustainability.

1. Problem Statement

Based on the above, the central research problem can be framed as follows :

To what extent does agile management offer an effective response to the challenges of a changing business environment, and what are the mechanisms for its application in modern organizations ?

2. Sub-Questions

From this central problem arise the following research questions :

- What are the theoretical foundations and core principles of agile management that set it apart from traditional models ?
- What are the major challenges facing today's business environment, and how do they affect organizational stability and flexibility ?
- How can agile management provide practical and organizational solutions to these challenges ?
- What lessons can be drawn from case studies of organizations that have adopted agile management in highly dynamic environments ?

3. Hypotheses

To answer the above questions, the study is based on the following hypotheses :

- Agile management relies on principles such as iteration, value delivery, collaboration, and responsiveness to change, which make it better suited to unstable business conditions ;
- The contemporary business environment is marked by complex challenges such as technological shifts, globalization, economic fluctuations, changing consumer behavior, and evolving regulations—necessitating more flexible management methods ;
- Agile management offers targeted responses to each of these challenges through tools like short development sprints, Kanban boards, co-design labs, and value stream mapping ;
- Case studies of large organizations show that implementing agile management leads to measurable improvements in responsiveness, efficiency, cost reduction, and customer satisfaction.

4. Significance of the Study

This study is important in that it provides a comprehensive Academic analysis of the relationship between agile management and the evolving challenges of the business environment. It contributes to the theoretical grounding of agile concepts while linking them to real-world applications in global organizations. Moreover, it offers a practical reference for companies seeking flexible and effective solutions to cope with increasing market complexity.

5. Objectives of the Study

The main objectives of this study are :

- To define the theoretical framework of agile management and its organizational principles ;
- To analyze and understand the nature of challenges facing today's business environment ;
- To highlight the role of agile management in addressing these challenges through practical experiences ;
- To offer scientific and practical recommendations for organizations seeking to adopt this management model.

6. Methodology

This study adopts a descriptive-analytical approach to examine the key concepts and theoretical models related to agile management and the challenges of the business environment. It also applies the case study method by analyzing successful real-life applications of agile management in different sectors. These cases were selected based on the variety of challenges faced, ranging from technology and economic shifts to cybersecurity and digital reputation. The aim is to assess the effectiveness of agile practices across diverse contexts.

The study includes both documented real-world examples and simulated analytical scenarios designed to practically and realistically illustrate the mechanisms of agile management, while maintaining academic rigor. The analysis is supported by credible secondary sources, including peer-reviewed articles and market studies. Key performance indicators such as speed, flexibility, efficiency, and organizational sustainability are emphasized throughout the evaluation.

Part One : Theoretical Framework of Agile Management

1. Emergence and Development of the Concept

The origins of agile management can be traced back to the early 20th century, when Toyoda Sakichi adopted an experimental approach to invent a loom that automatically stopped when a thread broke. This innovation highlighted core elements of what would become Toyota's operational philosophy. It emphasized three key ideas : the importance of observing processes on the ground, building high-quality products through error-prevention systems, and separating human input from machine function.

In the 1950s, these ideas evolved into what became known as the Toyota Production System (TPS), drawing on Sakichi's legacy. TPS focused on two core concepts : Jidoka (automation with a human touch) and Just-In-Time (JIT) production. Over time, Toyota realized the broader potential of this model and began transferring TPS principles to its key suppliers.

Taichin Ohno, a prominent engineer at Toyota, was the first to formalize agile thinking into a structured model in the early 1950s. His work built on the post-World War II recovery efforts, during which Toyota implemented a robust improvement program to escape financial crisis and operational inefficiency. Influenced by thinkers such as Henry Ford and Frederick Taylor, the company combined mass production methods with scientific management to enhance industrial efficiency. The concept of quality control also became central to Japan's industrial rise.

By the 1960s, Toyota entered the US market and expanded significantly in the 1970s, surpassing even domestic competitors like Volkswagen. However, the broader recognition of Toyota's production excellence did not emerge until the 1973 oil crisis, when Toyota's resilience and rapid recovery drew global attention. Its production system, later known as Lean Production, had already been in place for decades.

In the 1980s, researchers at the Massachusetts Institute of Technology (MIT) conducted a global study of automotive manufacturing performance, comparing various plants to Toyota's model. In 1991, James Womack and Daniel Jones published their influential book The Machine That Changed the World, which described Toyota's system and coined the term Lean Production. This term captured the idea of achieving more with less—less space, labor, capital, inventory, and fewer defects.

In the 1990s, economists noted that environmental changes were occurring faster than organizations could adapt. This misalignment often led to missed opportunities and even bankruptcy. In response, the US Department of Defense organized a panel of experts at Pennsylvania State University to study strategic solutions. Their findings were published in a two-volume report titled 21st Century Manufacturing Enterprise Strategy. This marked a turning point for the use of "agility" in management literature and inspired a wave of academic research.

Agility was soon recognized as a strategic necessity for organizational survival in uncertain environments. It emerged as a key factor in achieving competitive advantage by enabling continuous innovation and delivering high-quality products and services. In 1996, Womack and Jones published another foundational book, Lean Thinking, which elaborated on lean principles and tools. It was reprinted in 2003 and helped establish a comprehensive knowledge base that promoted waste reduction, precise delivery, strict quality control, and well-defined performance standards. (Source : Abu Bakr & Abdullah, 2020, pp. 660–685)

Despite the historical roots of agile management dating back to the 1950s, it was between the 1970s and early 1990s that the associated practices gained global prominence. This period saw Toyota achieve exceptional results in sales and manufacturing quality, driven by the integration of techniques such as quality circles, just-in-time production, and a comprehensive production system that came to be known as Lean Management.

Lean Operations, as practiced by Toyota, became a strategic approach centered on minimizing waste and maximizing customer value. This method focuses on retaining only the processes that add value, while eliminating unnecessary steps. The result is increased efficiency, higher productivity, and the ability to deliver innovative, high-quality products at low cost. It enables companies to provide what customers want, at an affordable price, and in the shortest possible time. In this sense, lean operations have become Toyota's "secret formula" for success and its position as the most profitable automaker in the world.

Toyota's commitment to agile management—and its later adoption by other leading companies—has produced impressive outcomes in cost control, waste elimination, product quality, and customer satisfaction. This success has helped expand the concept beyond manufacturing to become a key framework in management at large.

2. The Concept and Characteristics of Agile Management

A. Definition of Agile Management

Before defining agile management, it is important to begin with the broader notion of agility. Agility has been defined as "the ability to detect opportunities and threats, and respond to them easily, quickly, and skillfully, with appropriate adaptation, as a core business necessity." It has also been described as "the ability to respond to unexpected changes with speed and flexibility, and to use these changes effectively by seeing them as opportunities for progress" (Tallon & Pinsonneault, 2011, p. 463).

In recent years, researchers have shown growing interest in identifying new management concepts that can keep pace with rapid scientific and technological developments. There is now a race to discover new terms, frameworks, and principles that can be applied to manage the speed and scale of industrial transformation. It is no longer feasible for organizations to rely on outdated methods in an era defined by accelerated production driven by emerging technologies.

Among these contemporary terms is agile management, which has been widely discussed in academic studies and research papers. Some scholars define agile management as the ability of business organizations to operate with rapid responsiveness, quickly adjusting work methods to meet the demands of change. This approach relies on a management style that prioritizes value creation, process flow, alignment, and continuous improvement, largely driven by teamwork. It places strong emphasis on data quality and its intelligent use, aiming to respond quickly to surrounding challenges and opportunities in order to deliver the best possible product or service to customers. Additionally, agile management pays special attention to identifying and eliminating non-value-adding activities as soon as they are detected.

At its core, the idea of agile management is based on a foundational principle of waste elimination, targeting all forms of inefficiency embedded in the production process. To apply this effectively, organizations must commit to ongoing improvement and continuous development of all internal activities. This continuous enhancement forms the cornerstone of the agile management system.

Agile management has also been defined as a set of actions and practices that must be performed correctly, in the right sequence and timing, in order to create value for a specific task or process. This definition emphasizes respect for process order, time sensitivity, and quality standards. The goal is to deliver outputs that meet expectations in terms of timing, quality, and impact—ultimately resulting in meaningful added value (Matar, 2024, pp. 33–34).

Agile management has been defined as a managerial approach that incorporates the core principles of agility to organize work, enhance efficiency, and improve overall performance. It involves a set of actions that must be executed properly, in the correct sequence and at the right time, in order to create value in a specific activity. Its primary goal is to eliminate waste continuously and add value through ongoing improvement. Agile management also seeks to enhance customer service, build strong relationships with suppliers, increase flexibility, and accelerate responsiveness to change. In addition, it aims to improve quality levels, reduce inventory, and boost productivity (Moqaymeh, 2025, p. 42).

Agile management is also described as a management style applied to organize work and improve both efficiency and operational performance. It requires a series of carefully executed actions that follow a logical sequence and occur at the right moment to generate value for the organization. The core aim is to reduce operational waste, deliver continuous improvement, enhance customer service, foster strong supplier relations, improve organizational flexibility, and increase responsiveness to dynamic conditions. Further raising objectives include quality standards, reducing inventory levels, and improving productivity.

In a similar vein, agile management has been defined as an organization's ability to execute management tasks with rapid responsiveness, and to adjust work methods in line with evolving requirements. It is a practice that emphasizes value-driven processes, workflow optimization, collaborative efforts, and a focus on operational excellence. It also benefits from teamwork, collective energy, shared knowledge, and effective use of data and factual information. The aim is to achieve the highest possible performance and output quality for customers, while eliminating any activity or component that does not add value to the organization or the client.

Furthermore, agile management has been explained as a process involving two key dimensions : eliminating all forms of managerial waste, and identifying and developing optimal methods for improving administrative processes and activities. Based on these definitions, agile management can be understood as a management approach that seeks to minimize administrative inefficiences, continuously improve activities, enhance service quality, and strengthen responsiveness to both local and global changes.

This is achieved through mechanisms such as :

- Workspace organization ;
- Continuous improvement ;
- Multi-skilled teams ;
- Standardized0 work practices.

Ultimately, agile management aims to ensure optimal performance, efficient resource use, and enhancement of all operational and administrative processes. Its value lies in enabling institutional transformation through practical tools and flexible methods. It also improves the working environment, encourages knowledge investment, and emphasizes training and development to raise performance levels (Al-Fitouri & Al-Sharif, 2023, pp. 20–21).

Based on the previous definitions, we can conclude that agile management refers to an organization's

capacity to manage operations with fast response times and to quickly adapt work methods to meet the demands of change. It is a management approach that focuses on values, flow, alignment, and striving for excellence through teamwork. It emphasizes effective use of information, agility in responding to challenges and opportunities, and delivering optimal outcomes for customers. At its core, agile management stands in contrast to rigid and outdated traditional models that are characterized by excessive waste, inefficiency, and slow adaptation.

Some scholars also view agile management as a resource-conscious philosophy, focused on optimizing production without compromising required quality levels. Since the emergence of this concept, a growing body of research has explored its key elements and implementation strategies. Agile management is seen as a powerful means to generate value for all stakeholders, and it reflects a shift in how employees are perceived—no longer as mere executors of tasks, but as strategic partners in continuous improvement and development.

This approach also pays attention to improving the psychological work environment and investing in appropriate training programs for staff development.

B. Common Terms in Agile Management

Like any scientific discipline, agile management includes a set of specialized terms. Below is a sample of commonly used terminology in the field:

Table 01 : Common Terms in Agile Management

The term	Definition
5 whys	heAsk the question five times about the reasons for failure to reach the root cause of the problem. There may be several reasons for the problem, and they can be identified through this method.
7 wastes	sheAll activities that are unprofitable for the organization and do not add value to the process. There are seven types : excess production, Waiting, Transport, Process, Stock, Movement, Products Defective
DMAIIC	It is the gradual improvement of processes using the Six Sigma Quality methodology, which is an abbreviation for six interconnected stages, which are : identification Define, Measure, Analyze, Improve, deny DImplement, Control.
Just in Time (JIT)	He A system for planning manufacturing operations and carrying out production on demand, which is based on the system clouds Instead of the traditional mass production called push system.
Jidoka	It meansSelf-stopping of machines means that the machines must stop working on their own. whenoccurrenceerror, This term is based on principle Quality at all stages Manufacturing To detect errors early and work on fixing them.
Kanban	Term Japanese It means (board) It is a board that contains work tasks or information specific, Such as name, description, and quantity and others, It is a business management system. Maintains On an organized and efficient flow of materials at all stages Manufacturing, The system depends on clouds So that the production will not be done unless there is a demand attic, on Reverse payment system where Production is ongoing.
Kaizen	Kaizen It is a Japanese term meaning improvement .continuous, taken fromphrase (Kai) It means Continue And (Zen) Which It means Improvement, While some translate it tothat (Kay) means change And (Zain) meaning good or best.

Poka Yoke	He A manufacturing method that prevents errors by designing the production process, tools, and equipment so that manufacturing is not carried out incorrectly .correct, And often to him what It is indicatedfor) Audit Mistakes (And it is He who prevents the parts wrong Of its production or Assemble it, Or specify Mistakes easily, Or check mistakes.
Fishbone Chart	She A tool used to solve quality problems by linking causes with effects and organizing them logically. In Skeletal diagram For the fish, It is called also With a plan A shikawa Or cause and effect diagram.
SMED	She Initial letters of the words of the sentence Exchange of Die Single MinuteIt means Replace the mold in just a few minutes .practically Setup and counter Monotheism It has several procedures to implement it in the form Correct, It is known as a way to reduce time .The machine ,and reduce setup time and operations Preparation and counter for the operationyield, And reduce costs, allowing production quantities Small.
TPM	He Total Productive Maintenance is an abbreviation for Total Productive Maintenance, a Japanese philosophy used to monitor and manage equipment to ensure it stops working.

Source : (Musallat & Al-Otaibi, 2024, pp. 103–104)

C. Characteristics of Agile Management

Based on earlier definitions, the key characteristics of agile management include :

- **Customer Focus** : Prioritize customer satisfaction by delivering products or services that add real value and meet their needs and expectations.
- **Continuous Improvement :** Pursue ongoing enhancement of processes, products, and services through regular evaluation and identification of improvement areas.
- **Waste Elimination** : Identify and remove activities that do not add value to processes or products, such as wasted time, effort, or resources.
- **Flexibility and Adaptability** : Adjust quickly to changes in the work environment and customer needs by adopting flexible methods.
- **Teamwork** : Promote collaboration among team members and encourage sharing of knowledge and experiences to achieve shared goals.
- **Employee Empowerment** : Grant employees the authority to make decisions and take responsibility. This increases their engagement and motivation.
- **Effective Communication :** Ensure clear and transparent information flow among team members, management, and employees.
- **Data-driven Decision-Making** : Use data and information to inform effective decisions.
- **Made-to-Order Production** : Produce goods or deliver services based on actual customer demand, not in advance.
- **Transparency and Accountability** : Clearly define goals, responsabilités, and outcomes. This upholds accountability and openness.

3. Objectives and Principles of Agile Management

A. Objectives of Agile Management

As defined by Al-Shahri and Uqaili (2023, p. 156), the objectives of agile management include :

- Achieve zero waste across all areas—covering machine breakdowns, delays, defective products, inventory at all supply stages, employee incidents, equipment failures, and human effort ;
- Reduce service delivery time and accelerate response to customer requests, while improving productivity and quality ;
- Minimize waste caused by overproduction and unnecessary employee or equipment movement ;
- Drive institutional transformation using practices and tools that make activities simple, fast, and streamlined. Enhance the work environment and competitive culture among employees ;

- Implement team-based work systems (cross-functional teams) and Total Productive Maintenance to reduce maintenance time and cost ;
- Foster creativity, innovation, knowledge investment, and fight against workplace routine (Mohamed & Kurtat, 2019, p. 39)

B. Principles of Agile Management

Agile management is built on core principles that guide administrative operations, notably :(Nicoulas & Thomas, p. 81)

- Strategic, long-term decision-making—even if it requires short-term costs ;
- Establish realistic, practical systems to handle administrative issues as they arise ;
- Promote a smooth, democratic structure across administrative processes without unnecessary bottlenecks ;
- Address problems directly and promptly to avoid disruptions, ensuring high-quality administrative outputs ;
- Develop clear, ongoing operational plans and employ continuous improvement ;
- Transparently identify and resolve errors using best practices ;
- Integrate technology into administrative work to avoid committing resource waste and prevent errors ;
- Rely on capable leadership to manage administrative processes effectively and mobilize resources ;
- Form dedicated administrative teams aligned with organizational philosophy and systems ;
- Encourage all stakeholders to contribute toward institutional improvement ;
- Engage in field-level tracking of work to detect errors and manage administrative processes step by step ;
- Avoid rushing administrative decisions ; Consider the interests of all parties and prevailing conditions ;
- Implement a system to track problems and their causes and design effective solutions for continuous administrative advancement.

James and Daniel (2009) emphasize that agile management focuses on eradicating administrative waste—both material and human—to improve operations and achieve planned institutional goals, leading to progress and high-quality administrative outputs.

4. Tools and Requirements for Applying Agile Management

A. Agile Management Tools

To achieve the philosophy of waste elimination, agile management is supported by several mechanisms and techniques. Many of these serve as sub-systems within the broader agile framework, while others represent policies or strategies that make waste reduction a central goal. These tools include :

- **Just-in-Time (JIT) Production Philosophy** : Align administrative processes exactly with demand—no more, no less. This approach targets elimination of waste and damage by ensuring that only what is needed is produced, based on a pull system driven by actual need. (Larry, 2012, p. 64)
- **Jidoka Philosophy** : A core principle of agile management, Jidoka emphasizes built-in quality and shifting quality control to the process Itself. This includes :
  - **Direct Inspection** : Workers themselves monitor quality ; External quality inspectors are unnecessary and wasteful.
  - **Source Inspection** : Investigating how and Why defects occur to address root causes.
  - **Clear Accountability** : Well-defined steps that pinpoint when and where a defect occurred.
  - **Necessary Stoppage** : Halting operations upon detecting defects until the root issue is resolved.
  - **Standardized Work** Precisely detailed administrative procedures that reduce variability and prevent errors. This also involves timing the administrative cycle to maintain consistency across units. (Barac, Goran & Alexandra, 2010, p. 144)

- **5S Philosophy** : This set of five Japanese principles helps improve workplace conditions, reduce time wasted searching for tools, and enhance occupational safety. All five terms begin with the letter "S" :
  - **Seiton** : Organize the workspace so tools are readily available and users are safe.
  - **Seiso** : Clean and maintain a workspace that supports comfort and efficiency.
  - **Seiri** : Sort and remove unnecessary items.
  - **Seiketu** : Make prior standards part of the work environment's management.
  - **Shituke** : Train staff and still discipline in behavior and practices. (Michel, n. d, p. 56)

Additional agile tools include mechanisms that support the overall reduction of waste and reinforce agile policies throughout the organization (Hashmi & Mahdi, 2019, p. 27)

- **Continuous Improvement (Kaizen)** : Kaizen is a Japanese practice for making small, straight for ward, and progressive improvements to products, services, and processes. It aims to lower costs, reduce waste, and boost productivity. It also reflects the idea of "continuous improvement" across every area of an organization—not limited to production. Everyone, from executives to front-line staff, participates in ongoing enhancement efforts.
- **Lean Six Sigma (Six Sigma)** : Six Sigma comes in different interpretations: as a statistical measure of quality, a strategy, a methodology, or a philosophy of continuous improvement. It builds strong reputations for organizational products and services, benefiting end-users, customers, and stakeholders. Key pillars of Six Sigma include training, continuous improvement, organizational culture, and upper-management support. The term "Six Sigma" refers to allowable variation in any process, which helps organizations estimate the average level of defects. When product characteristics fall outside the pre-set upper or lower limits, they are considered defective.
- **Multi-Skilled Workers** : This concept refers to employees who are versatile, skilled, knowledge able, and trained to understand and trouble shoot current operations and make improvements. This contrasts with traditional management, which leans on highly specialized experts. Post-agile research views workers as essential partners in continuous improvement—not just task executors. This climate perspective also emphasizes the importance of psychological workplace.
- **Single Minute Exchange of Die (SMED)** : SMED is a method for changing machine setup tools in under ten minutes. It achieves this by clearly defining each step in the setup process and using simple tools to shorten internal preparation time. These setup tasks cannot be completed during production runs, so speed is key.

These tools contribute significantly to conserving resources—especially rare ones. The success of Toyota, in eliminating waste via these methods, stands as a clear testament to the effectiveness of this management philosophy.

B-Requirements for Applying Agile Management

As outlined by (Atik 2023, pp. 1914–1915), successful application of agile management requires :

- **Support from Senior Leadership** : The shift to agile management depends on leaders' commitment. They must provide financial, human, and material support, along with time and a shift from bureaucratic to democratic systems that foster initiative and creativity.
- **Cultural Transformation** : Leadership drives culture. Influential leaders embed agile values—adaptable and enduring—which help organizations thrive. Japanese firms, for instance, foster loyalty and job satisfaction through a paternal-yet-structured leadership approach.
- **Flexible Training and Development** : Organizations must evolve from traditional training to agile, flexible models. Team-based training equips employees with broad, adaptable skills. Investing in staff development is crucial to reducing waste.
- **Collaboration between Management and Staff** : Creating a participa tory environment boosts employee motivation, productivity, and job quality. It also strengthens social relationships between employees and management.
- **A Flexible Organizational Structure** : Agile organizations maintain flexibility and build partnerships that yield mutual benefits—inside and outside the institution.
- **Educational Process Development** : Revise curricula to match evolving student needs. Offer shorter programmes, attractive courses, and project-based teams. Monitor and assess their performance continuously.

- **Two Way Administrative Communication :** should be interactive and balanced. Poor information flow hampers operational continuity.
- **Adaptive Technology :** Invest in modern hardware and flexible information systems. This enhances the ability to produce relevant outputs—whether products or graduates—in emerging fields.
- **Digital Transformation** Simplify work flows by replacing paper work with electronic formats, shifting learning online, and using digital libraries instead of physical ones.
- **Supporting Experimentation and Innovation** : It is essential to test new activities, even if this requires reallocating resources from existing ones—especially in quality programs. To foster innovation, organizations should promote creative teaching and learning methods and invest in staff development.
- **Encouraging Dissent** : Opinions that favor maintaining the status quo often reflect contentment without growth. In contrast, dissenting views help identify weaknesses and suggest ways to improve and transform the organization.

In conclusion, applying agile management in universities requires full integration among all stakeholders. Leaders, administra tors, staff, faculty members, and students must work together to achieve agile goals. This cooperation should be supported by flexibility, awareness of current developments, and effective communication. It also calls for training in agile methods to build diverse skills and knowledge across disciplines. This approach helps drive innovation, spreads a culture of agility and continuous learning, and creates an inclusive environment that values creativity, cultural exchange, and openness to differing views.

5. Enablers and Barriers to Agile Management

According to (Al-Harbi and Al-Ghamdi, 2021, p. 309), these factors are divided into two categories :

A. Enablers of Agile Management

- The need to get closer to customers, especially under rising competition.
- The desire to adapt to environmental changes, which leads to :
  - Reduced operating costs and less capital waste ;
  - Better understanding of customer needs ;
  - Improved operational quality and fewer errors ;
  - Empowerment of multi-skilled individuals ;
  - Increased knowledge of production and all value chain processes.

B. Barriers to Agile Management

- Natural resistance to change, often driven by doubts about the value of agility ;
- Lack of available time ;
- Concerns about how change may affect organizational loyalty ;
- A production culture focused on large volumes, large batches, minimum inventory, and avoiding production stoppage ;
- Rigid manufacturing models that limit supply chain responsiveness ;
- Organizational cultures that operate in Silos

Part Two : Theoretical Framework of the Changing Business Environment

1. The Concept and Characteristics of the Business Environment

A. Definition of the Business Environment

The business environment is a key factor in analyzing a firm's economy. Many economic decisions depend on how the organization interacts with its environment. An institution's ability to adapt to environmental changes directly affects its economic performance and long-term survival.

According to P. Kotler and B. Dubois, the most successful organization is one that understands its environment and adapts accordingly. If we view the firm as an open system that interacts with its external surroundings, it becomes a subsystem within that broader environment. (El-Hajj, 2015, p. 13)

Given its broad scope, the business environment raises questions about its boundaries, components, and level of influence. Since it lies outside the firm's direct control, it includes all external actors and forces that can influence how the organization builds and maintains market relationships. (El-Hajj, 2015, p. 13)

From this, we understand that the business environment has no fixed boundaries—as long as external factors can influence the firm's decisions or direction.

(Ben Habib, 2009, p. 40) describes the business environment as part of the administrative setting that supports planning and goal achievement. It includes five groups of stakeholders : customers, suppliers, employees of competing companies, and interest groups such as governments and labor unions. This definition excludes other actors like banks and non-competing financial institutions that still maintain active relationships with the organization.

Nasir Dadi Adoun, drawing on P. Filho, offers a broader definition, identifying three levels of variables within the business environment :(Adoun, 1998, p. 83)

- National-level variables (economic, social, and political) ;
- Operational-level variables specific to each organization (government bodies, distribution firms) ;
- Internal variables (employees, managers, etc.).

This definition is unique in its inclusion of both internal and external factors. Thus, the business environment consists of : **Internal environment** the organizational structure, human and material resources, and corporate culture, **External environment** all surrounding factors beyond the firm's control

The general perspective on the business environment recognizes both internal and external components. Therefore, it can be defined as : "A set of factors, dimensions, and elements that influence administrative, organizational, and strategic practices. Understanding the nature and interactions of this environment helps management find the best ways to respond in a balanced and adaptive manner, which strengthens organizational capabilities and enhances outcomes." (Bani Hamdan & Idris, 2009, p. 71)

The business environment is also defined as: "A set of internal and external factors or variables—whether measurable or not—located within or outside the organization, which affect or may affect the efficiency and effectiveness of organizational performance, and which may or may not be recognized by management as presenting opportunities or constraints."(Sakarna, 2010, p. 192)

From the definitions above, the key features of the business environment can be summarized as follows : (Qahiwi, 2013, p. 85)

- Everything within or outside the boundaries of an organization falls within the scope of the business environment. This includes both measurable and immeasurable factors and variables ;
- These variables influence how well organizations achieve their goals, perform their activities, and manage their costs ;
- Management may or may not be aware of these variables, which means that managerial effectiveness differs from one organization to another. Therefore, the business environment can represent both constraints and opportunities.

From this, we conclude that the business environment is the broader context in which an organization operates. It consists of interrelated elements that interact with the organization in complex causal ways. It includes all internal and external conditions that directly or indirectly affect organizational decisions and activities. Understanding and analyzing this environment is crucial to ensure that the organization can adapt to ongoing changes and maintain efficient and sustainable performance.

B-Characteristics of the Changing Business Environment

The modern business environment is shaped by several defining characteristics :

- **Dynamism and Continuous Change** : The current business environment is marked by rapid and ongoing changes that affect both operational and strategic areas. This is evident in fast-paced technological developments that create new products and services at an unprecedented rate. Economic conditions can shift overnight due to global crises or monetary policy changes. Consumer preferences and behaviors are also increasingly unstable due to social media and global awareness. These ongoing changes demand that organizations closely monitor their environment and adopt flexible strategies. (Carroll & Buchholtz, 2014, p. 215)
- **Complexity and Interdependence** : The business environment is highly complex, influenced by multiple intertwined factors. Decisions are no longer based on simple variables. Instead, they are shaped by market forces, government regulations, competitors' actions, stakeholder expectations, and societal trends. Globalization intensifies this complexity by linking local and international factors. The digital revolution adds further layers through new communication channels and unprecedented interactions. (Daft, 2015, p. 112)
- **Uncertainty and Unpredictability** : Organizations face high levels of uncertainty, making long-term planning increasingly difficult. Sudden technological changes can render existing products obsolete. Geopolitical instability can disrupt supply chains. Health and environmental crises can appear without warning. In the digital age, the rapid spread of news intensifies this uncertainty, where a local event can escalate into a global crisis within hours. (Al et al, 2013, p. 9)
- **High Interconnectedness** : All components of the business environment are now tightly linked. Government monetary policies influence financing costs, which then affect corporate investment and innovation. Technological advances in one part of the world can create threats or opportunities elsewhere. Demographic shifts shape consumption patterns, which then drive marketing and production strategies. This level of interconnectedness requires a holistic approach in decision-making. (Griffin, 2019, p. 87)
- **Globalization and Borderless Competition :** Globalization has turned the business environment into a global competitive arena. Organizations now face rivals from across the world, manage supply chains that span continents, and target culturally diverse markets. Competitive standards are now global. Consumers expect the same service and quality regardless of geographic location. Organizations must understand cultural and legal differences and be capable of operating within diverse political and economic systems.(Hill & Jones, 2013, p. 156)
- **Intense Competition** : Today's market is marked by fierce competition. Organizations compete for market share, talent, and resources. Entry into many markets is now easier, allowing small startups to challenge industry giants. Technology has reduced the advantages of scale, placing greater importance on innovation and speed. Digital transparency has made it difficult to retain competitive advantages, as successful products and services can be quickly imitated. (Laudon & Laudon, 2018, p. 203)
- **Increased Dependence on Technology** : Technology now under pins nearly all business operations. From automated production systems to e-commerce platforms, from big data analytics to artificial intelligence, no organization can function effectively without keeping pace with technological advances. This dependence brings efficiency and innovation but also increases vulnerability to cybersecurity risks and requires ongoing investment in digital infrastructure. It is also reshaping the job market and required skillsets. (Porter, 2008, p. 45)
- **Focus on Sustainability and Social Responsibility** : Environmental and social sustainability have become core elements of business strategy. Stakeholders—including consumers, investors, and regulators—now demand eco-friendly practices across operations and supply chains. Corporate social responsibility (CSR) is vital for building reputation and attracting talent. Financial performance is no longer the only measure of success ; Organizations must also balance social and environmental impact. (Robbins & Coulter, 2018, p. 134)
- **Diversity and Pluralism** : Organizations deal with more diverse workforces and customer bases than ever before. Differences in age, gender, culture, and values create both opportunities and challenges. Diversity fosters innovation through the inclusion of varied perspectives. However, it also demands inclusive management practices and multidimensional communication strategies to engage with stakeholders across multiple platforms. (Thomas & Ely, 1996, p. 89)
- **Time Sensitivity and Speed of Response** : Time has become a critical competitive factor. The ability to respond quickly to threats and opportunities often determines organizational success. Product life cycles are shorter, and periods of competitive advantage are shorter. Speed in decision-making and execution, without compromising accuracy, has become essential. Customer expectations for instant service and rapid delivery place additional pressure on operations. (Wheelen & Hunger, 2012, p. 78)

2. Components of the Business Environment

From the above definitions, we understand that the business environment consists of two main components :

A. External Environment : Due to its wide scope and diverse dimensions, the external environment has been studied from various perspectives. Trist & Emery define it as: "The set of components, dimensions, and elements that influence organizations through direct and indirect interactions with their surroundings, resulting in complex causal relationships and diverse outcomes."(Musa'da, 2015, p. 134)

Similarly, Quinn & Mintzberg describe it as : "The set of external factors surrounding the organization, which influence strategic decision-making directly or indirectly."

Daft defines it as : "All elements and components outside the organization's boundaries, which are mostly beyond the short-term control of management."(Musa'da, 2015, p. 134)

These definitions suggest that the external environment is a complex and broad system. As a result, several models have been developed to help analyze and understand it. One of the most widely used models distinguishes between two levels : **General Environment** also called the macro or indirect environment ; **Task Environment** also referred to as the direct or industry environment. (Musa'da, 2015, p. 135)

- **Components of the External Environment :**

The external environment refers to the set of factors surrounding an organization that influence its strategic direction in one way or another. These factors are generally classified into two main categories :(Daoudi, 2017, p. 39)

- **General Factorsm :** These include political, economic, social, technological, environmental, and cultural variables. These variables are broad in scope and lie beyond the organization's control. They affect all operating institutions within the broader business environment.
- **Specific Factors** : These are the elements that are closer to the organization, such as suppliers, financiers, competitors, intermediaries, and customers. In this case, the organization has some capacity to interact with and influence these elements within certain limits.

Therefore, a clear understanding of both types of factors enables organizations to develop flexible and effective strategies to overcome challenges and take advantage of opportunities.

B. Internal Environment : The internal environment is one of the key determinants of an organization's competitive advantage. It gives the organization its unique characteristics in terms of operational practices and performance levels. The internal environment includes a set of organizational, physical, and knowledge-based factors that are under the organization's direct control.

According to Certo, the internal environment : "Represents the organizational level directly related to administrative and managerial practices. It varies from one institution to another depending on core capabilities and the strengths or weaknesses that can influence how opportunities and threats in the external environment are handled." (Musa'da, 2015, p. 134)

- **Components of the Internal Environment**

The internal environment forms the framework through which an organization can control its resources and direct them toward its strategic goals. It is a foundational element in the strategic planning process. Effective planning is not possible without a clear analysis of internal capabilities and resources.

This environment is represented by the core functions of the organization, such as :
human resources, organizational structure, organizational culture, information systems, research and

development, and financial capacity. These elements enable management to run the organization efficiently by leveraging strengths and addressing weaknesses. They also help align internal capacities with external demands. (Daoudi, 2017, p. 39)

Part Three : The Practical Framework : The Role of Agile Management in Addressing the Challenges of a Changing Business Environment

Methodological Note : To strengthen the practical aspect of this article, a number of examples have been used to show how agile management can help respond to rapid challenges in the business environment. These examples include both documented real-world cases and illustrative simulations designed to explain mechanisms in a simple and practical way. The aim of this blend is to link theoretical concepts with real-life applications while maintaining academic rigor. This approach aligns with the analytical case study method and contextual representation of data.

1. Challenges of the Changing Business Environment

The key challenges facing today's dynamic business environment include :

- **Rapid Technological Change :**

Fast-paced technological development poses a major challenge for companies. It requires constant investment in upgrading digital infrastructure and reorganizing operations to keep up with new innovations. Technologies such as artificial intelligence and cloud computing push organizations to adopt flexible business models to avoid obsolescence. At the same time, high development costs place financial pressure on startups. Successful adaptation depends on building a dynamic culture that supports experimentation and continuous learning, while carefully managing the risks of adopting immature technologies.

- **Globalization and Fierce Competition**

Globalization has eliminated geographic barriers, expanding markets and intensifying competition across industries. Companies are under pressure to differentiate themselves through strategies like product localization. Local companies face threats from multinational giants. These dynamics require organizations to develop cross-cultural competencies while preserving their identity, especially as the phenomenon of global standardization grows. Globalization creates opportunities for growth across borders but also exposes businesses to geopolitical instability. (Kim & Mauborgne, 2015, pp. 112–138)

- **Economic Volatility**

Unexpected changes in key economic indicators—such as exchange rates and interest rates—can destabilize the business environment. This results in supply chain disruptions and reduced consumer purchasing power. Multinational corporations face significant financial risks due to global economic interdependence. This calls for hedging strategies such as market diversification and flexible product development. Monetary policy uncertainty, especially in emerging economies, adds to these risks.

- **Changing Consumer Preferences**

Consumers are becoming less loyal to traditional brands. They now demand personalized experiences and ethical values. This shift pushes companies to redesign operations with greater transparency and sustainability, and to accelerate innovation to meet the demand for instant service. Understanding these changes requires flexible data collection methods and behavioral analysis. Superficial assumptions must be avoided, especially those that ignore cultural and social dimensions. (Thiel & Masters, 2014, pp. 67–70)

- **Evolving Laws and Regulations**

Ongoing legal changes in areas such as taxation, environmental compliance, and regulatory oversight present major operational risks, particularly for companies operating across borders. Adapting to this unstable regulatory environment requires specialized units to track legislative updates and develop flexible contingency plans. These challenges become more complex when legal requirements vary between countries. This creates the need for local expertise to avoid financial penalties and reputational damage.

- **Talent Crisis**

The private sector faces a growing gap between available skills and the needs of advanced technical fields. This crisis is worsened by limited vocational training programs and academic curricula that do not align with market demands. Organizations must adopt proactive strategies. These include partnerships with universities, well-designed career development paths, and a focus on the expectations of younger generations seeking meaningful work. (Ritzer, 2018, pp. 89–92)

- **Cybersecurity Risks**

Cyber threats are growing as reliance on digital infrastructure increases. Advanced attacks now target critical infrastructure and sensitive data. Managing these risks requires a comprehensive approach. This includes regular vulnerability assessments, employee training on security practices, and the use of advanced encryption technologies. Digital trust is an intangible asset that is hard to regain after a breach. This raises the responsibility for protecting information.

- **Sustainability Pressures**

Environmental standards are shifting from secondary concerns to core elements of competitiveness. Consumers and regulators now demand circular economies and lower carbon footprints. Companies face the challenge of balancing high costs of green transformation with pricing pressures. This calls for innovative business models that redefine the value delivered to customers. Transparency in reporting environmental, social, and governance (ESG) performance has become essential to build credibility. (Duhigg, 2016, pp. 54–118)

- **Supply Chain Disruptions**

Recent global crises have exposed the fragility of complex logistical networks. Geopolitical events and natural disasters can paralyze the flow of materials. These disruptions have prompted companies to restructure their supply chains. Strategies such as partial localization and proactive storage are now commonly adopted. Investments in AI-based forecasting tools have also increased. Building strategic partnerships with suppliers and developing flexible procurement systems are key to enhancing resilience.

- **Reputation Management in the Digital Age**

In the era of social media, corporate reputation has become a highly sensitive asset. A single negative event can escalate into a crisis within hours. Effective management requires digital monitoring tools and rapid response systems. Transparency must be embedded in communication policies. Defensive strategies alone are not enough. Companies need to build reputational capital through community initiatives and ethical commitment. Reputation has become a major driver of trust among investors and customers. (Covey, 2004, pp. 120–150)

In light of the above, it is clear that the modern business environment faces complex and accelerating challenges. These emerge from rapid technological shifts, globalization, economic volatility, changing consumer behavior, regulatory pressures, and environmental concerns. These challenges compel organizations to adopt flexible business models and proactive strategies focused on innovation, risk management, and the development of human and technological capabilities. Transparency and trust have become essential—whether in data protection, sustainability, or social responsibility. In a digitally connected world, adapting to change is no longer optional. It is vital for survival and competitiveness.

2. The Importance of Adopting Agile Management to Address Challenges in the Changing Business Environment With Practical Examples :

A. Agile Management and Technological Change

Agile management relies on short, iterative development cycles (2–4 week sprints). These cycles break down complex technical projects into deliverable units. This enables organizations to integrate emerging innovations—such as artificial intelligence or blockchain—by testing prototypes with users early on. Agile methods improve adaptability using digital Kanban boards that track progress and adjust priorities in real-time. They reduce traditional development cycles by up to 70%, turning technological threats into competitive opportunities.

Example : In 2023, Tesla conducted 48 development sprints to update its autonomous driving systems. Each sprint incorporated real-time driving data from 500,000 vehicles via AWS Cloud. It tested 12 machine learning algorithms in advanced simulations replicating 10 million driving scenarios. Weekly updates were delivered to users, with instant feedback analysis using ML tools. The process—supported by daily planning meetings and live dashboards—reduced development time from 18 months to 3 weeks. It increased system accuracy by 40% and reduced false detections by 65% through algorithm updates every 72 hours. This example highlights the importance of robust digital infrastructure to support big data and agile methods. However, such practices may face challenges in organizations with limited technological capacity.

B. Agile Management and Globalization

Agile management helps organizations navigate the complexity of global markets. It relies on geographically distributed, self-managing, multicultural teams. These teams use asynchronous coordination tools like digital Kanban boards to make fast local decisions while maintaining global alignment. Agile frameworks allow for rapid localization, adapting global products to local cultures in 45 days instead of six months. This approach reduces customization costs by 30% by avoiding centralized bureaucracy.

Example : **Unilever** encountered cultural gaps in Southeast Asian markets. It formed 15 agile local teams (each with 8 members in marketing, manufacturing, and anthropology). In India, the team conducted 300 field visits to consumer homes to study hair care habits. They designed a line of Ayurvedic shampoos using local herbs in 45 days, based on real-time sales data from 500 stores. Three formulations were tested through A/B sprint testing with 5,000 consumers. This agile approach—with dailys and weekly reviews—increased market share by 18% within six months and cut customization costs by 45%. The approval process was reduced from 12 steps to just 3. (Rigby, Elk, & Berez, 2024, pp. 117–121, 189–194)The case demonstrates that agile success depends on culturally competent local teams empowered to make independent decisions. This may be difficult in contexts with less autonomy or cultural diversity.

C. Agile Management and Economic Volatility

Agile management supports dynamic reprioritization through value stream mapping. This tool assesses the profitability of activities weekly. Redirect meetings allow for reallocating resources across projects within 72 hours. Agile also relies on real-time market data—sales and consumption trends—to instantly adjust production. Flexible project portfolios help absorb economic shocks by redirecting up to 60% of investments toward emerging opportunities.

Example : During the 2023 inflation crisis, Zara shifted 60% of its production capacity from luxury apparel to low-cost essentials in just two weeks. It used daily sales data from 2,000 stores to adjust production lines weekly through a digital Kanban system. The company formed 25 agile alignment teams that analyzed consumption patterns in 15 emerging markets using AI forecasts. Twenty product designs were modified monthly based on analysis of 500,000 social media posts. These measures reduced deadstock by 45% and increased revenue by 5% despite the recession, cutting the design cycle from 9 months to just 11 days. This experience shows that agile responses to economic shifts require real-time market intelligence and institutional capacity for rapid resource reallocation.

D. Agile Management and Changing Consumer Preferences

Agile organizations use co-creation labs that involve consumers directly in the development process. These labs collect real-time feedback and conduct usability tests after each iteration. The approach follows the Minimum Viable Product (MVP) principle, allowing for the testing of up to 30 ideas monthly with selected user samples. This reduces the response time to market changes from six months to three weeks.

Example : In 2023, LEGO launched a participatory design system. It gathered feedback from 500,000 children each month through a digital platform. Thirty of the most-voted ideas were turned into prototypes within three weeks through intensive sprint cycles. Fifty models were tested with 10,000 children across 100 stores using eye-tracking technologies. LEGO released 35 limited-edition products (5,000 units each) and implemented weekly incremental updates. This process increased sales by 28% and reduced unsold inventory by 90%, cutting development time from 24 months to just 45 days. (Sutherland & Altman, 2023, pp. 177–182)The case highlights the need for advanced digital infrastructure and an organizational culture that supports continuous experimentation and rapid adaptation to evolving consumer preferences—an area where many companies may struggle.

E. Agile Management and Regulatory Change

Agile management establishes. compliance pods, which are flexible units working in parallel with development teams. These pods integrate new regulatory updates into weekly sprints using automated tracking tools powered by NLP and AI. They conduct automatic compliance testing on up to one million simulated transactions per week. This process reduces compliance update time from three months to ten days and cuts compliance costs by 30%.

Example : JP Morgan faced updates in anti-money laundering regulations. It formed 20 agile teams, each with six members including legal experts, developers, and testers. Each team conducted a weekly sprint to scan 500 pages of legislation using NLP tools. They modified 15 monitoring systems and tested compliance on 2 million simulated transactions using Monte Carlo simulations. System updates were completed in 8 days instead of 90, avoiding fines worth $190 million and reducing regulatory errors by 70% through a “compliance code-first” approach.

This case highlights the critical need for close coordination between legal and technical teams to successfully implement agile management in complex regulatory environments, a challenge for some organizations.

F. The Role of Agile Management in Addressing the Talent Crisis

Agile management fills skill gaps through rapid learning sprints and flexible job rotation programs that align personal goals with project needs. It relies on servant leadership to transform managers into facilitators, increasing employee retention by 25% and training 12,000 employees internally each year.

Example : At Microsoft, Azure teams conducted 120 skill sprints annually, each lasting two weeks. Each sprint focused on emerging technologies such as quantum computing, involving 30 hours of practical training, real project development, and peer evaluations via Git Hub in 2024. This process qualified 12,000 employees internally, reduced reliance on external hiring by 40%, and increased team productivity by 35% by shortening the adaptation time to new technologies from six months to three weeks.

This example shows that investment in internal training and rapid learning programs strengthens human capital. However, such initiatives require substantial resources and a supportive organizational culture.

G. The Role of Agile Management in Mitigating Cybersecurity Risks

Agile integrates security into every development phase through repeated security reviews and daily automated vulnerability scans covering 100,000 endpoints. It applies a “security code-first” principle with automatic penetration tests at the end of each sprint, reducing breaches by 80% and cutting repair time to 48 hours.

Example : At Amazon Web Services, agile security teams scan 100,000 servers daily using Inspector tools, test 50 systems monthly in security hackathons, and update policies through weekly sprints in 2023. They detected 98% of vulnerabilities before exploitation, reduced DDoS attacks by 65%, and shortened average repair time from 21 days to 36 hours via immediate fix sprints.

This model stresses the importance of embedding security into agile development. It also points to the need for ongoing investments in automation and testing, which may challenge organizations with limited resources.

H. The Role of Agile Management in Addressing Sustainability Pressures

Agile achieves environmental balance by integrating ESG indicators into operational Kanban boards and applying circular design principles. It monitors carbon footprints weekly through IoT device data in factories. Supply chain transparency is enhanced via blockchain technology, reducing waste by 40% and material costs by 15%.

Example : IKEA implemented the "Green Kanban" project, tracking consumption of 200 raw materials across 1,000 factories using IoT sensors. It adjusts 120 products annually based on weekly sustainability analytics and cut the use of unrecycled plastic by 62% over 18 months. The project saved $28 million per year, reduced emissions by 45%, and achieved net-zero certification in 12 factories through 50 monthly data-driven improvements.

This example demonstrates that embedding sustainability metrics in agile processes is feasible and impactful. However, achieving supply chain transparency remains a real challenge that must be addressed for success.

I. The Role of Agile Management in Managing Supply Chain Disruptions

Agile tackles disruptions through flexible supply networks that can be reshaped within 72 hours using AI forecasts and dynamic Kanban boards. It relies on a data base of 5,000 alternative suppliers, reducing down time by 85% through a "supply-as-a-service" model.

Example : During the 2023 chip shortage, Apple responded by activating a digital map of 1,500 alternative suppliers and forming 30 agile teams to inspect chip quality within 48 hours using A/B testing on 100,000 samples. They adjusted 70 product designs to accommodate substitute chips, replacing eight key suppliers in seven days, maintaining 92% production capacity, and cutting supply costs by 18% through daily agile negotiations.

This experience confirms that supply chain resilience depends on flexible contractual agreements and supplier transparency—factors not easily found across all markets and sectors.

K. The Role of Agile Management in Reputation Management in the Digital Era :

Agile deploys real-time response systems that unite 24/7 digital monitoring teams with AI-driven sentiment analysis monitoring five million posts daily. Transparent communication policies convert 70% of crises into loyalty opportunities, reducing containment time from 72 hours to 6 hours.

Example : During the 2024 Starbucks product crisis, the "Reputation Shield" system monitored five million posts across 20 platforms within two hours using Brandwatch tools. A multidisciplinary crisis team (legal, marketing, support) issued a tailored apology and resolution within four hours. Immediate compensations turned 70% of negative comments into positive ones, loyalty raising indicators by 25%. The crisis was transformed into a marketing campaign that garnered 15 million positive impressions on social media.

This example shows that successful digital crisis management through agile requires pre-established communication policies and a multi-skilled team capable of high-pressure coordination.

CONCLUSION :

The title of this article, "Agile Management as an Effective Response to the Challenges of the Changing Business Environment," serves as an entry point for a deep understanding of the interaction between a modern and evolving management model and an organizational reality characterized by increasing volatility and complexity. Today's business environment is dynamic, disruptive, and full of diverse challenges, demanding that organizations seek management tools defined by flexibility, speed, and innovation simultaneously.

Within this context, agile management is not merely a partial solution or secondary choice. Instead, it offers a comprehensive response capable of enabling organizations to overcome the gaps of traditional planning. It transforms evolving challenges into strategic opportunities through both practical and virtual applications that have proven effective. Based on this premise, the study reviewed various dimensions of the relationship between agile management and the core challenges facing today's business environment, providing applied evidence that strengthens the credibility of this modern management model.

1. Results : The study's results are summarized as follows in relation to the hypotheses tested :

- *Hypothesis One :* The study confirmed that agile management, grounded in principles such as iteration, phased delivery, and collaborative work, can provide real added value in environments marked by uncertainty, such as rapid technological change.
- *Hypothesis Two :* It was confirmed that today's business environment challenges are multifaceted and directly impact organizational performance. Agile management has supplied effective tools to face these challenges in situations including globalization, economic crises, and market shifts.
- *Hypothesis Three :* The applications demonstrated that agile management offers effective responses to these major challenges through organizational mechanisms such as Kanban boards, development sprints, and iterative A/B testing, which enhance institutional adaptability.
- *Hypothesis Four:* The study found that organizations adopting agile management recorded better performance indicators compared to their counterparts, whether in customer satisfaction, cost reduction, or increased market share, confirming the model's practical effectiveness.

2. Recommendations : Based on the findings of this article, the following recommendations are proposed :

- Integrate agile management at the core of institutional strategy, not only in technical or temporary projects ;
- Update organizational structures to support cross-functional and self-directed teams, enabling decision-making at operational levels without waiting for central approval ;
- Adopt short development sprints and fast learning cycles as a basis for flexible performance ;
- Enhance a culture of collaboration and transparency through digital tools such as Kanban boards ;
- Launch co-creation labs to involve customers in product development stages ;
- Implement the Minimum Viable Product (MVP) approach to test innovations before full-scale application ;
- Incorporate environmental and social sustainability indicators into performance systems and transform them into daily operational inputs ;
- Establish agile compliance pods to ensure immediate responses to changing laws and regulations ;
- Develop agile cybersecurity units relying on regular reviews and automated tests in each development cycle ;
- Foster a culture of servant leadership to turn managers into facilitators rather than mere supervisors ;
- Build dynamic databases of alternative suppliers to increase supply chain flexibility and reduce downtime ;
- Adopt smart digital reputation monitoring mechanisms linked to immediate multi-scenario response plans ;
- Redesign decision-making processes based on real-time market and consumer data ;
- Invest in continuous skill development through ongoing skill sprints linked to project goals ;
- Institutionalize innovation as an operational process rather than a one-off initiative, with specialized teams generating and testing ideas within each business unit.

Keywords Liquidity, selected pharmaceutical companies, case study.

Abstract

This study compares the short-term liquidity of three leading Indian pharmaceutical firms Sun Pharmaceutical Ltd., Cipla Ltd., and Divi's Laboratories over five financial years (2019–20 to 2023–24). Using secondary data from company annual reports, we compute current, quick, and cash ratios, examine trends, and apply one-way ANOVA to test inter-firm differences. Results show Divi's Laboratories holds the strongest average liquidity (current ratio 6.81; quick ratio 4.78), Cipla ranks second with stable performance (current 4.32; quick 3.10 and the lowest variability), while Sun Pharma trails on levels (current 1.76; quick 1.37) but records the fastest improvement over time. ANOVA indicates significant differences across firms for current and quick ratios ($p<0.05$), but not for cash ratio ($F=3.09$, $p=0.08$). Cash positions are highest yet volatile at Divi's (mean 0.66), modest and slightly declining at Cipla (0.07), and low but improving at Sun Pharma (0.04). The findings suggest targeted actions: Sun Pharma should accelerate receivables recovery and inventory turnover to lift baseline liquidity; Cipla should rebuild cash buffers without sacrificing operating stability; Divi's should smooth cash-flow swings and deploy surplus liquidity efficiently. Overall liquidity strength ranks Divi's > Cipla > Sun Pharma, with Sun on an improving trajectory.

Introduction:

India's pharmaceutical industry has established itself as a significant player on the global stage in recent years. The company is renowned for its ability to provide affordable, high-quality generic drugs, vaccines, and active pharmaceutical ingredients (APIs). When it comes to providing solutions for healthcare on a global scale, Indian pharmaceutical companies play a significant role due to their robust production infrastructure and the growing domestic and international markets they serve. It is a significant provider of generic pharmaceuticals, accounting for more than twenty percent of the global market in terms of volume, and it satisfies approximately sixty-two percent of the demand for vaccinations across the globe. The aforementioned are some of the most important aspects of this sector. In addition to being a significant producer of active pharmaceutical ingredients (APIs), the nation is home to more than 3,000 companies and 10,500 facilities, making it the nation that has the largest number of US FDA-approved manufacturing plants that are located outside of the United States. The domestic pharmaceutical industry is presently valued at $50 billion, and it is expected that it will increase to $130 billion by the year 2030. Some of the causes that are driving the expansion of the industry include increasing incomes, urbanization, and greater access to healthcare. For the purpose of developing products that go beyond generics, Indian companies are increasing their investments in research and development. The majority of their efforts are focused on biosimilars and complex formulations, particularly in therapeutic areas such as oncology and diabetic drug development. During the fiscal year 2023, the pharmaceutical business in India exported a total of $25.39 billion worth of products, the majority of which were shipped to the United States of America, as well as more than 200 other countries. This was a significant factor in India's rise to prominence as the "pharmacy of the world." Several measures, such as the output-linked incentive plan, have been implemented by the government in order to boost the amount of API that is produced locally and to attract investment from elsewhere.

Sun Pharmaceutical Ltd.:-The company that is now known as Sun Pharma was initially formed in 1983 by Dilip Shanghvi under the name Sun Pharmaceutical Industries Limited. Sun Pharma is the current name of the company. It is possible to locate the headquarters of the corporation in Mumbai, Maharashtra, which is the most important financial center in India. Formulations and active pharmaceutical ingredients (APIs) are widely acknowledged to be among the most specific areas of expertise that Sun Pharma possesses. The focus of this method is on a wide variety of therapies, both acute and chronic. Its therapeutic segments include psychiatry, anti-infectives, neurology, cardiology, orthopedics, diabetology, gastroenterology, ophthalmology, nephrology, urology, dermatology, gynecology, respiratory, cancer, dental, and nutritional medicines. These therapeutic segments are comprised of approximately three thousand molecules of high quality.

Divis Labs:-Beginning in 1990, Divi's Laboratories was established with the express intention of doing research and development in the field of life sciences. The primary focus of the company is on the creation of cutting-edge and creative manufacturing processes for pharmaceutical intermediaries and other active pharmaceutical ingredients (APIs).

Cipla Ltd:-Dr. K. A. Hamied established Cipla Limited in 1935, and it has since grown to become one of the most successful global corporations in India in the fields of biotechnology and pharmaceuticals. The production of active pharmaceutical ingredients (APIs) and formulations takes place at 34 cutting-edge Cipla sites located all over the country. Cipla is primarily responsible for the development of pharmaceuticals that are intended to treat conditions such as depression, obesity, cardiovascular illnesses, arthritis, and diabetes.

Review of Literature:

Liquidity management is an essential component of financial stability, especially in sectors characterized by elevated operational expenses and variable cash flows, such as the pharmaceutical business. Liquidity is typically evaluated using ratios including the current ratio, quick ratio, and cash ratio (Pandey, 2015). Indian pharmaceutical companies experience several challenges in liquidity management, such as price control restrictions, competition from generic drugs, extended gestation times for new pharmaceuticals, and dependence on foreign money for raw materials. (Sood, 2016). After researching a selection of pharmaceutical firms in India, Nair and Iyer concluded that although the majority of these companies keep a solid current ratio, their quick ratio is frequently lower, indicating that they rely on their inventories for short-term liquidity. Particularly in the event of unanticipated changes in the market or in regulatory policies, which could result in disruptions to cash flow, this can be a risky endeavor (Nair and Iyer 2017). These ratios offer insights into a company's capacity to fulfill its short-term obligations using its short-term assets. Liquidity management is becoming more important for pharmaceutical companies due to their dependence on ongoing research and development (R&D), regulatory approvals, and raw material expenses, which can entail lengthy manufacturing cycles and payments that are delayed (Patnaik, 2018). For pharmaceutical firms, research and development is not only a big investment, but it also plays an essential part in ensuring the company's continued profitability over the long term. Since the expense of research and development is frequently incurred before the product generates any revenue, the researcher states that this spending has a direct impact on the liquidity of pharmaceutical organizations. At the same time that they continue spending money on research and development for future expansion, Indian pharmaceutical companies, especially smaller ones, have the difficulty of maintaining acceptable liquidity levels (Singh and Yadav 2019). Furthermore, variations in demand, particularly in export markets, might impact cash flows. Consequently, firms with inadequate liquidity may find it challenging to meet operational expenses, finance new initiatives, or adapt to abrupt market fluctuations (Bansal, 2020). Research has analyzed the liquidity status of several pharmaceutical firms. Ravindra et al. (2020) look at how well some drug companies make money and how easy it is for them to get cash. The liquidity position of the industry is affected by various elements, such as international rules, export needs, and the cost structure associated with research and development and compliance. Pharmaceutical firms in India, particularly within the generic sector, frequently maintain a conservative liquidity policy given intense competition and government regulation (Sharma, 2020). The current and quick ratios are frequently used to assess liquidity in pharmaceutical companies. However, these statistics alone may not offer a comprehensive understanding of a company's liquidity, particularly when firms maintain significant assets in inventories or receivables. (Ghosh & Das, 2020). The main goal of this study was to find out how well the biggest drug companies are doing and compare them to each other. Then, based on their profitability or liquidity performance, they were ranked. A case study investigated the liquidity of companies that include Sun Pharmaceutical and Cipla, revealing that although they sustained sufficient liquidity levels, their elevated receivables and inventory management could render them vulnerable to liquidity risks in unfavorable market conditions. Conversely, organizations such as Dr. Reddy's Laboratories demonstrated superior working capital management, enhancing their robust liquidity position (Kumar and Kaur 2021). Patel and Singh (2021) revealed that pharmaceutical companies possessing strong intellectual property rights portfolios—comprising patents, trademarks, and copyrights—experience competitive advantages, including market exclusivity and enhanced profitability, which ultimately foster enduring financial success and value generation. Patel and Rao (2021) discovered that companies that strictly comply with regulatory requirements—encompassing manufacturing practices, marketing laws, and medication safety—enhance operational efficiency, mitigate risks, and improve financial performance, thereby strengthening their competitiveness and reputation in the industry. Dheepalakshmy and Angelamary (2024) performed a comparative analysis of Sun Pharmaceutical Industries Limited and Dr. Reddy's Laboratories Limited over five years, highlighting how the systematic application of financial ratios uncovers both strengths and weaknesses, thereby facilitating strategic planning for investors and stakeholders confronting industry challenges like regulatory changes and global competition. India's pharmaceutical sector ranks among the largest globally, recognized for its generic medications that substantially impact the international market. The Indian Brand Equity Foundation (IBEF, 2024) states that India holds the third position in pharmaceutical manufacturing by volume. Adopting a sectoral perspective, Gautam and Madhavi (2024) assessed various pharmaceutical companies from 2017 to 2021 through profitability, liquidity, and solvency ratios. They found generally robust liquidity and solvency but identified inconsistencies in profitability among firms. They recommend improving weak financial ratios and minimizing operational costs to ensure long-term sustainability and enhance investor attraction. Collectively, these studies demonstrate the complex characteristics of financial success within the Indian pharmaceutical sector, influenced by innovation, regulatory adherence, and strategic analysis based on educated decision-making.

Objective For the Study: -

- To evaluate the liquidity position of selected pharmaceutical companies listed on major stock exchanges like the NSE.
- To compare the liquidity positions of different pharmaceutical companies.
- To analyze trends in liquidity over a specified period.
- To provide actionable recommendations based on findings from the analysis.

Scope of the Study: -

The provision of medical products and services is the most fundamental requirement in contemporary society. The liquidity performance of the company is of interest and concern not only to the owners, shareholders, creditors, governments, and other stakeholders of the firm, but also to the general welfare and growth of civilization as a whole. Thus, it is vital to be aware of the company's Liquidity performance since it is of importance and concern to all of these groups. The issue of "Liquidity position of selected pharmaceutical companies in India—A case study" has to be investigated to fulfill the requirements that have been identified. Examples of the sorts of financial ratios that has been utilized in this investigation include the current ratio, Quick ratio and Cash ratio. Through the examination of the trend of financial ratios, the purpose of the research is to assess the financial standing of the organizations chosen throughout the past five fiscal years (FY19-FY23).

Research Methodology: -

Sample size: -The focus of this paper is on three companies chosen from a group of ten major Indian pharmaceutical companies. Sun Pharma Ltd., Divi's Lab., and Cipla Ltd. are some of these. These companies has been selected based on market capitalization .

Period of the study: -This study covers a period of 5 years from the financial year 2019-20 to 2023-24.

Data collection methods: - To research, compile, and tabulate the annual reports of the firm for the past five years, the current investigation heavily relies on secondary sources of information. The data has been collected from a few selected sources, including the annual reports of the company, the internet, and the necessary financial data collected from the official website of the companies, as well as other websites.

Hypotheses

Hypothesis 1

Ho – There is no significant difference between current ratio of selected companies.

H_1 – There is significant difference between current ratio of selected companies.

Hypothesis 2

Ho – There is no significant difference between Quick ratio of selected companies.

H_2 – There is significant difference between Quick ratio of selected companies.

Hypothesis 3

Ho – There is no significant difference between Cash ratio of selected companies.

H_3 – There is significant difference between Cash ratio of selected companies.

Limitation of the study: -Most of the information in the study comes from secondary sources, such as audited annual reports. If the audited accounts have any mistakes or unclear information, they could give results that are misleading. The conclusions can not be as complete as they could be because the research only looks at data from the last five years (2019–2024).

Data Analysis

Liquidity ratio: A liquidity ratio is an indicator of whether a company's current assets will be sufficient to cover the company's short-term debt commitments when they become due, and it is a major measure of financial health. Liquidity can be measured using numerous ratios :-

Current Ratio:-The current ratio, or working capital ratio, assesses a company's capacity to fulfill its short-term liabilities due within one year. The ratio evaluates the weight of total current assets in relation to total current liabilities. It reflects a company's financial stability and ability to optimize its present assets' liquidity to fulfill obligations and liabilities. The formula for the current ratio can be utilized to assess a company's liquidity.

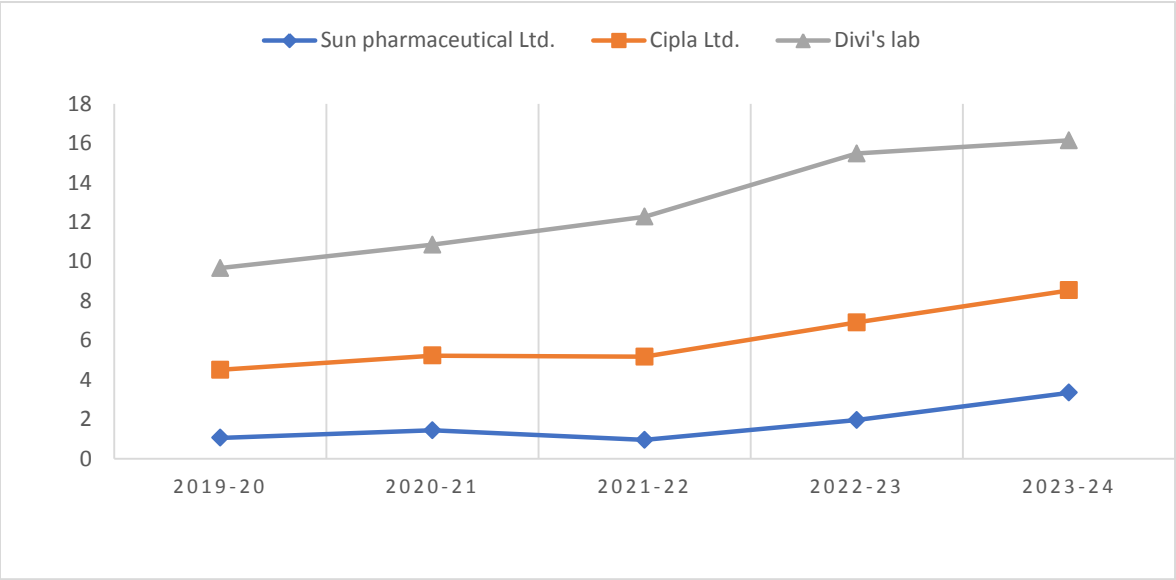
Current Ratio = Current Assets / Current Liabilities

Table 1: Current Ratio of the Selected Pharmaceutical Companies

Year	Sun Pharmaceutical Ltd.	Cipla Ltd.	Divi's lab
2019-20	1.07	3.44	5.16
2020-21	1.44	3.79	5.63
2021-22	0.96	4.22	7.10
2022-23	1.97	4.95	8.57
2023-24	3.35	5.19	7.60
Mean	1.76	4.32	6.81
SD	0.98	0.75	1.41
CV %	55.49	17.25	20.65
CAGR%	0.26	0.09	0.08

Source: - Compiled and computed from various Annual reports of selected Pharmaceutical Companies

Chart 1: Current Ratio of the Selected Pharmaceutical Companies



Interpretation

An evaluation of the current ratio data from 2019–20 to 2023–24 for Sun Pharmaceutical Ltd., Cipla Ltd., and Divi's Laboratories reveals significant differences in their short-term liquidity positions. Based on the mean values, Divi's Laboratories holds the strongest average current ratio at 6.81, indicating a robust ability to cover short-term obligations, followed by Cipla Ltd. with 4.32, while Sun Pharmaceutical Ltd. lags behind with a comparatively lower mean of 1.76, reflecting tighter liquidity management. In terms of standard deviation, which reflects the extent of fluctuations, Divi's Lab exhibits the highest variability at 1.41, whereas Sun Pharma and Cipla show lower deviations of 0.98 and 0.75 respectively, suggesting greater consistency in Cipla's liquidity levels. The coefficient of variation (CV), which measures relative consistency, further supports this observation, as Cipla Ltd. maintains the lowest CV of 17.25%, implying the most stable liquidity pattern among the three, while Sun Pharma's CV of 55.49% indicates substantial inconsistency. Although Divi's Lab demonstrates strong liquidity, its CV of 20.65% suggests moderate variability. Regarding growth, the Compound Annual Growth Rate (CAGR) shows that Sun Pharmaceutical Ltd. has achieved the most significant improvement over the five-year period with a CAGR of 0.26, compared to Cipla's 0.09 and Divi's 0.08, reflecting a notable upward trend in its current ratio.

ANOVA TEST OF CURRENT RATIO

Ho – There is no significant difference between current ratio of selected companies**.**

H_1 – There is significant difference between current ratio of selected companies.

SUMMARY						
Groups	*Count*	*Sum*	*Average*	*Variance*		
Sun Pharmaceutical Ltd.	5	8.79	1.75	0.95		

Cipla Ltd.	5	21.59	4.31	0.55		
Divi's lab	5	34.05	6.81	1.97		
ANOVA

Between Groups	63.82	2	31.91	27.47	3.31695E-05	3.88
Within Groups	13.94	12	1.16			
Total	77.76	14				

Source : Author's calculation through EXCEL

**** at 5% significance level**

A one-way ANOVA test has been applied to assess whether the average current ratios of Sun Pharmaceutical Ltd., Cipla Ltd., and Divi's Laboratories differ significantly over the five-year period from 2019–20 to 2023–24. The ANOVA test for the current ratio shows that the calculated F-value (27.47) is greater than the F critical value (3.88), and the p-value (0.000033) is less than the 0.05 significance level. This means there is a statistically significant difference in the mean current ratios among Sun Pharmaceutical Ltd., Cipla Ltd., and Divi's Lab. Therefore, the null hypothesis is rejected, and it is concluded that the current ratios of the selected companies are not the same.

Quick Ratio (Acid-Test Ratio): The quick ratio is a financial metric that assesses a company's capacity to meet its current liabilities without liquidating inventory or securing extra funding. It is a more cautious metric than the current ratio, which encompasses all current assets. The quick ratio is determined by dividing a company's most liquid assets by total current liabilities, omitting some assets such as prepaid expenses and inventories. An elevated ratio signifies improved liquidity and fiscal well-being.

Quick Ratio = Quick Assets / Current Liabilities

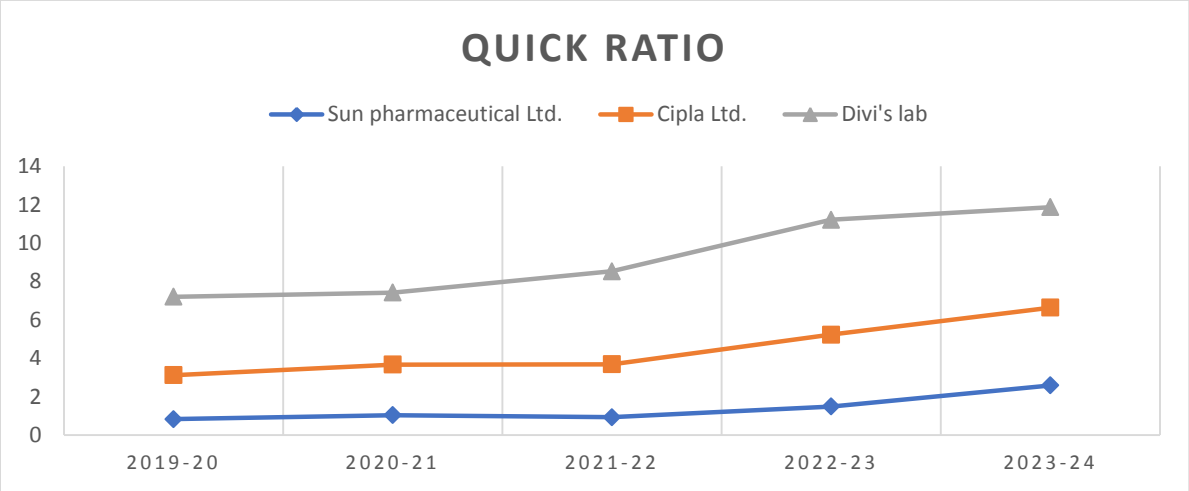
Table 2: Quick Ratio of the Selected Pharmaceutical Companies

Year	Sun Pharmaceutical Ltd.	Cipla Ltd.	Divi's lab
2019-20	0.83	2.29	4.09
2020-21	1.03	2.64	3.75
2021-22	0.93	2.77	4.84
2022-23	1.49	3.74	5.99
2023-24	2.58	4.05	5.23
Mean	1.37	3.10	4.78
SD	0.72	0.76	0.90

CV%	52.62	24.44	18.73
CAGR%	25.48	12.08	5.06

Source: - Compiled and computed from various Annual reports of selected Pharmaceutical Companies

Chart 2: Quick Ratio of the Selected Pharmaceutical Companies



Interpretation:

The analysis of the quick ratio reveals distinct liquidity positions among the selected pharmaceutical companies. On average, Divi's Laboratories (4.78) has maintained the highest quick ratio, indicating a stronger ability to meet short-term obligations without relying on inventory, followed by Cipla Ltd. (3.10) and Sun Pharmaceutical Ltd. (1.37). In terms of stability, the standard deviation values suggest that Sun Pharma (0.72) and Cipla (0.76) experienced moderate year-to-year fluctuations, while Divi's Lab (0.90) has showed relatively higher variability despite having the highest mean. The coefficient of variation further emphasizes this pattern, with Sun Pharma (52.62%) showing the highest relative volatility in liquidity, Cipla (24.44%) maintaining moderate stability, and Divi's Lab (18.73%) displaying the most consistent quick ratio performance over the period. Regarding growth trends, the compound annual growth rate (CAGR) indicates that Sun Pharma has achieved the fastest improvement in quick ratio (25.48%), followed by Cipla (12.08%), while Divi's Lab (5.06%) has shown slower but steady growth. Overall, the results highlight that Divi's Lab leads in liquidity strength, Cipla balances high liquidity with stability, and Sun Pharma, though starting from a lower base, has shown the most significant improvement over the five-year period.

ANOVA TEST OF QUICK RATIO

Ho – There is no significant difference between Quick ratio of selected companies.

H_a – There is significant difference between Quick ratio of selected companies.

SUMMARY						
Groups	*Count*	*Sum*	*Average*	*Variance*		
Sun Pharmaceutical Ltd.	5	7.04	1.40	0.68		
Cipla Ltd.	5	15.60	3.12	0.55		
Divi's lab	5	23.03	4.60	1.24		
ANOVA						
Source of Variation	*SS*	*df*	*MS*	*F*	*P-value*	*F crit*
Between Groups	25.60	2	12.80	15.45	0.000477823	3.88
Within Groups	9.93	12	0.82			
Total	35.53	14				

Source : Author's calculation through EXCEL

**** at 5% significance level**

To examine whether there is a statistically significant difference in the mean quick ratios among the three selected pharmaceutical companies Sun Pharmaceutical Ltd., Cipla Ltd., and Divi's Laboratories a one-way ANOVA has been conducted. The ANOVA results for the quick ratio shows that the calculated F-value (15.45) is much higher than the critical F-value (3.88) and the p-value (0.00048) is well below 0.05. This indicates a statistically significant difference in the quick ratios among the selected companies. Therefore, the null hypothesis (Ho) is rejected, and it is concluded that the quick ratio varies significantly between Sun Pharmaceutical Ltd., Cipla Ltd., and Divi's Lab.

Cash Ratio: The cash ratio is a liquidity measure that assesses a company's ability to meet short-term obligations using only cash and cash equivalents. It is calculated by dividing the total cash and near-cash securities by total current liabilities. This ratio is considered more conservative than other liquidity measures as it focuses solely on the most liquid assets. A cash ratio greater than one indicates that a company has more cash than current debts, while a ratio less than one suggests more short-term debt than cash. Lenders, creditors, and investors utilize the cash ratio to evaluate a company's short-term financial risk.

Cash Ratio = Cash + Cash Equivalents / Current Liabilities

Table 3: Cash Ratio of the Selected Pharmaceutical Companies

	Sun Pharmaceutical Ltd.	Cipla Ltd.	Divi's lab
2019-20	0.02	0.10	0.03
2020-21	0.03	0.11	1.85
2021-22	0.04	0.07	1.03

2022-23	0.05	0.01	0.13
2023-24	0.07	0.06	0.27
Mean	0.04	0.07	0.66
SD	0.02	0.04	0.77

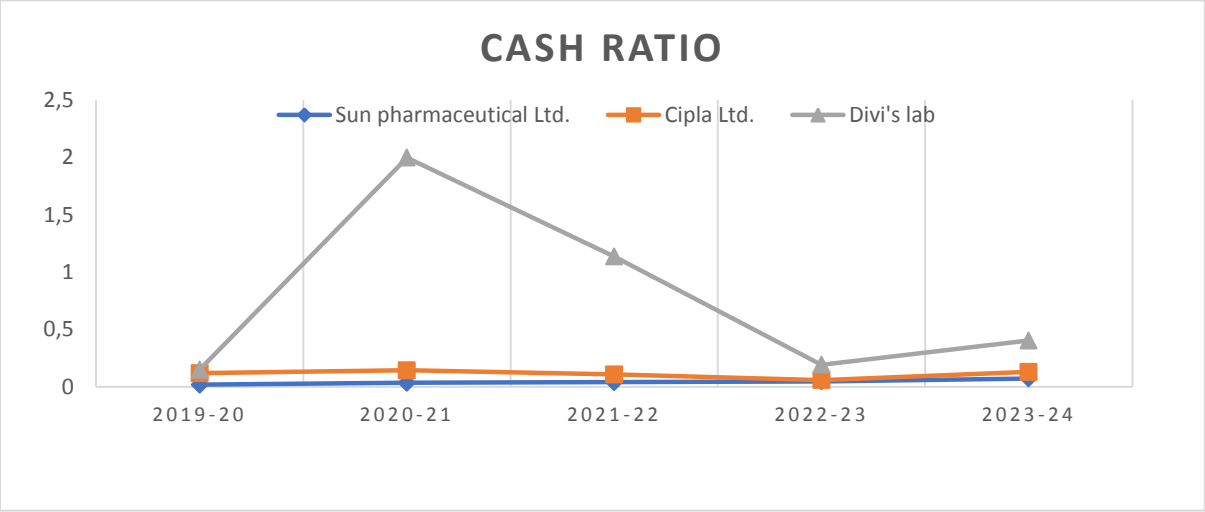
CAGR%	30	10	55

Source: - Compiled and computed from various Annual reports of selected Pharmaceutical Companies

Chart- 3: Cash Ratio of the Selected Pharmaceutical Companies



Interpretation

Table 3 presents the cash ratio of Sun Pharmaceutical Ltd., Cipla Ltd., and Divi's Laboratories for the period from 2019–20 to 2023–24. The mean cash ratio during this five-year period has been found 0.04 for Sun Pharmaceutical Ltd., 0.07 for Cipla Ltd., and 0.66 for Divi's Laboratories, indicating that Divi's Laboratories has maintained a significantly higher average cash position compared to the other two companies. The standard deviation, reflecting the extent of fluctuation in cash ratios, which is 0.02 for Sun Pharmaceutical Ltd., 0.04 for Cipla Ltd., and 0.77 for Divi's Laboratories. When measured in terms of relative volatility through the coefficient of variation (CV), Divi's Laboratories has showed the highest variability at 116.24%, whereas Cipla Ltd. and Sun Pharmaceutical Ltd. has CVs of 56.04% and 50.12% respectively. The Compound Annual Growth Rate (CAGR) of the cash ratio has been noticed 30% for Sun Pharmaceutical Ltd., indicating steady growth, whereas Cipla Ltd. has experienced a slight negative CAGR of -10%, and Divi's Laboratories has recorded the highest growth at 55% over the given period.

ANOVA TEST OF CASH RATIO

Ho – There is no significant difference between Cash ratio of selected companies.

H_3 – There is significant difference between Cash ratio of selected companies.

SUMMARY						
Groups	*Count*	*Sum*	*Average*	*Variance*		
Sun Pharmaceutical Ltd.	5	0.210	0.042	0.000		
Cipla Ltd.	5	0.350	0.070	0.001		
Divi's lab	5	3.315	0.663	0.594		
ANOVA						
Source of Variation	*SS*	*df*	*MS*	*F*	*P-value*	*F crit*

Within Groups	2.38	12	0.19			
Total	3.61	14				

Source : Author's calculation through EXCEL

**** at 5% significance level**

To assess whether there is a statistically significant difference in the mean cash ratios among Sun Pharmaceutical Ltd., Cipla Ltd., and Divi's Laboratories, a one-way ANOVA has been conducted. The analysis resulted in an F-value of 3.09, which is lower than the F-critical value of 3.88. Additionally, the p-value is 0.08, which is greater than the significance level of 0.05. Based on these results, we fail to reject the null hypothesis, indicating that there is no statistically significant difference in the mean cash ratios among the three pharmaceutical companies at the 5% significance level. This means that although Divi's Lab has a visibly higher average cash ratio (0.663) compared to Cipla (0.070) and Sun Pharma (0.042), the differences are not statistically strong enough to conclude that their liquidity positions, based solely on cash reserves, are significantly different.

Findings:

1. Sun Pharmaceutical Ltd.

Sun Pharmaceutical Ltd. has the lowest average current ratio (1.76) of the three chosen pharmaceutical businesses for the five-year period from 2019–20 to 2023–24. This means that it has relatively less short-term liquidity. The company's current ratio, on the other hand, has experienced the highest Compound Annual Growth Rate (CAGR) of 26%, which means that it is slowly getting better at meeting its current obligations. Sun Pharma also had the lowest average quick ratio (1.37) and the largest relative volatility (CV = 52.62%), which shows that the company's liquid assets has not found always enough. Its quick ratio CAGR has been found 25%, which has the greatest of the three companies. This shows that it is making improvement in terms of liquidity without taking into account its inventories. The company's cash ratio has maintained at an average of 0.04 with a moderate spread (CV = 50.12%), and it became continually with a CAGR of 30%. The results of a one-way ANOVA has showed that there is statistically significant differences in the current and quick ratios between companies. This supports Sun Pharma's weaker but improving liquidity position. However, the differences in cash ratios has not statistically significant, which means that Sun Pharma's lower cash holdings are not statistically different from those of its others.

2.Cipla Ltd.:
Cipla Ltd. has maintained a comparatively stronger liquidity position than Sun Pharmaceutical Ltd. over the period, with an average current ratio of 4.32 and the lowest coefficient of variation (17.25%) among the three, indicating the most stable liquidity performance. While the growth rate in its current ratio has been found moderate (CAGR = 9%), stability remained a key strength. Its quick ratio averaged 3.10, the second highest of the group, with a CV of 24.44%, again reflecting consistency in maintaining adequate liquid assets. The quick ratio CAGR of 12% shows modest improvement over time. However, in terms of cash ratio, Cipla has posted a low average value of 0.07, with a CV of 56.04% and a marginally negative growth rate (-0.10), suggesting a slight decline in absolute cash holdings over the five years. ANOVA analysis has confirmed statistically significant variation in both the current and quick ratios among the companies, situating Cipla in a relatively stable and favorable liquidity position overall. However, cash ratio differences across companies has not reach statistical significance.

3. Divi's Laboratories Ltd.
Divi's Laboratories has consistently exhibited the strongest average liquidity levels in terms of both current ratio (6.81) and quick ratio (4.78) during the study period, reflecting a robust capacity to meet short-term obligations. Despite the strength, the company has showed moderate variability in these ratios, with CV values of 20.65% for current ratio and 18.73% for quick ratio. Growth in these measures was modest, with a CAGR of 8% for current ratio and 5% for quick ratio, indicating stability rather than significant expansion. In terms of cash ratio, Divi's Laboratories far outperformed its peers with a mean value of 0.66, although this figure has been accompanied by the highest volatility (CV = 116.24%) and the strongest growth rate (CAGR = 55%). ANOVA tests has confirmed statistically significant differences between companies in current and quick ratios but not in cash ratios, suggesting that although Divi's cash position is visibly stronger on average, the variation is not statistically significant at the 5% level.

Suggestions:

1. Sun Pharmaceutical Ltd.
Although Sun Pharmaceutical Ltd. has shown improvement in its liquidity ratios over the study period, its overall current and quick ratios remain lower than those of its peers. The company should aim to enhance its short-term financial strength by increasing the share of liquid assets in relation to current liabilities. Faster recovery of receivables and more efficient inventory turnover could contribute to this improvement. Since growth trends in these ratios are already positive, management can build on this momentum by adopting prudent debt policies and ensuring that repayment schedules are comfortably matched with available liquidity. Maintaining a larger cushion of cash or cash-equivalent assets would also help reduce financial strain during unexpected events.

2. Cipla Ltd.
Cipla Ltd. demonstrates a stable liquidity position, with consistent current and quick ratios over the five years. However, the gradual decline in its cash ratio highlights the need to focus on rebuilding cash reserves. This can be done by reviewing cash management strategies and considering low-risk, highly liquid short-term investments. Reducing working capital tied up in receivables and inventories without impacting production or distribution efficiency could also free up more cash. By preserving its stability while strengthening cash holdings, Cipla can further enhance its financial resilience.

3. Divi's Laboratories Ltd.
Divi's Laboratories exhibits the strongest average liquidity among the companies studied, yet its cash ratio fluctuates widely. To address this, the company should focus on smoothing cash flows by better coordinating inflows and outflows, and by holding a steady reserve of cash. As current and quick ratios are already high, the emphasis should be on efficient use of assets to avoid excess idle resources. Surplus liquidity could be invested in secure, short-term instruments to generate additional income without compromising the firm's flexibility.

Conclusion:

The comparative analysis of liquidity ratios namely current ratio, quick ratio, and cash ratio for Sun Pharmaceutical Ltd., Cipla Ltd., and Divi's Laboratories Ltd. over the five-year period from 2019–20 to 2023–24 reveals notable differences in their short-term financial strengths.

Divi's Laboratories consistently recorded the highest average current and quick ratios, indicating an exceptional ability to meet short-term obligations. Its significantly superior cash ratio further reinforces this strong liquidity profile, although higher volatility in cash holdings suggests variability in cash management practices. Cipla Ltd. has the second most company, with consistent and reasonably high current and quick ratios and the least amount of change between the three companies. But because its cash ratio is slowly going down, cash reserve management needs to be looked at more closely. Sun Pharmaceutical Ltd., despite starting from a comparatively weaker liquidity position, registered the most notable growth in both current and quick ratios over the study period, signifying a positive trend in improving its short-term financial capacity. Nevertheless, its absolute liquidity levels remain the lowest among the three. Overall, based on average ratio values, stability, and ability to cover short-term obligations, Divi's Laboratories holds the strongest liquidity position, followed by Cipla Ltd., while Sun Pharmaceutical Ltd. remains in a relatively weaker but steadily improving position. This ranking aligns with the findings and supports the research objectives of evaluating and comparing liquidity positions and trends across the selected pharmaceutical companies.

Conflict of Interest

Keywords archaeological education, cultural heritage, fieldwork, pedagogy, summer schools, Azerbaijan

Abstract

he integration of archaeological research into educational practice has emerged as a strategic priority in fostering awareness of cultural heritage among younger generations. Strengthening students' engagement with the ancient history of their homeland requires direct exposure to the historical geography of early human settlements and the systematic promotion of archaeological monuments—particularly at a time when unsubstantiated claims regarding heritage sites are increasingly prevalent.

Educational tours and field-based programs at archaeological sites, many of which represent recently discovered monuments offering novel insights to scholarship, provide significant pedagogical and scientific benefits. Conducted within open-air "archaeoparks," these initiatives function as immersive learning laboratories that connect theoretical instruction with practical experience. Nevertheless, gaps persist in history curricula and teaching materials, particularly in the coherent and outcome-oriented presentation of ancient and medieval periods. A comprehensive, systematized approach to lesson design and delivery is therefore critical for achieving deeper student competencies.

Archaeological summer schools have demonstrated considerable success in addressing these gaps. By embedding creativity-driven pedagogical methods, these schools enhance student innovation, reflective thinking, and active participation. Structured scientific-practical modules, including masterclasses, excavation-based training, and guided site visits, enable students to develop key cognitive skills such as analogical reasoning, pattern recognition, and critical analysis. Through this blend of educational and experiential learning,

archaeological summer schools not only enrich academic training but also strengthen cultural identity and the promotion of heritage preservation.

Introduction

In recent years, a new term has emerged in archaeological practice and theoretical science: *archaeological summer school*. The establishment of such schools, including the development of their curricula, selection of participants, formation of the audience, and definition of their scientific direction, must be conducted professionally and systematically. Archaeological summer schools serve as educational and cultural initiatives aimed at promoting the discipline of archaeology among secondary and university students, advancing the study of ancient history, publicizing our tangible cultural heritage, and contributing to the identification and recognition of archaeological monuments.

In Azerbaijan, especially in recent years, archaeological summer schools have seen a growing audience, supported by the formation of professional teaching and training teams in this field. The primary objective is, naturally, to study the earliest traces of our historical memory and to disseminate this knowledge more widely among the younger generation. However, a key aspect is not only the study of ancient heritage but also the inclusion of archaeological, historical, and architectural monuments from various historical periods as subjects of academic inquiry and instruction.

The organization and direction of archaeological summer schools may involve one or several institutions and research centers. For this purpose, the coordinating institution must establish effective scientific oversight and ensure the orderly execution of fieldwork. This is particularly crucial because a substantial part of archaeological summer school activities consists of outdoor research, including archaeological excavations (see Figure 1).

An *archaeological summer school* is a structured program that focuses on the instruction of archaeology in outdoor field conditions, combining practical training with the theoretical knowledge acquired through formal education. It aims to bridge classroom learning and field application by revisiting and reinforcing theoretical concepts through the material-cultural remains uncovered during archaeological excavations.

The foundation of an archaeological summer school lies in the synthesis of information obtained from the study of archaeology as a scientific discipline—particularly ancient and medieval history in secondary school curricula and archaeology courses in university-level programs—with hands-on experience in open-air excavation environments. In secondary school history textbooks, archaeological excavations are generally covered within narrow limits. Only a small portion of the findings from excavations conducted in the country or globally is conveyed to students. Some recent archaeological excavations, particularly those involving newly discovered monuments, caves, open-air campsites, settlement sites (both urban and rural), necropolises, fortresses, cyclopean structures, places of worship, and shelters—although not presented in full depth—are partially introduced to students. Naturally, providing complete and detailed information on all such discoveries would considerably increase the academic load and risk overwhelming students with excessive archaeological detail.

Figure 1. Students of the Archaeological Summer School at the Qarasoy Kurgans (2023, Keşikçidağ State Historical and Cultural Reserve, Aghstafa District)

What is an Archaeological Summer School?

At the university level, archaeology is taught for a limited duration within history departments, while students from non-history faculties receive only a brief introduction to historical subjects, with minimal reference to archaeological methods or findings. Nonetheless, students are exposed to a degree of information on archaeological excavations and material-cultural heritage (see Figure 2).

Archaeological summer schools serve as platforms where theoretical knowledge acquired in both secondary and higher education is revisited and integrated within the context of actual field excavations. Their objective is to reinforce classroom-based learning with practical experience, deliver knowledge directly at the excavation site, and demonstrate that pre-written history can only be understood through archaeological sources [1].

Structure and Pedagogy of the Archaeological Summer School

An archaeological summer school must be based on a pre-established academic workload and curriculum. The participants should form a motivated and disciplined audience, capable of adapting to outdoor training conditions. This audience is not limited to students, university faculty, or schoolteachers. It may also include volunteers; young professionals working in scientific, medical, industrial, and public service sectors; staff from institutions and enterprises; employees of history and ethnography museums, historical-cultural and nature reserves; personnel from youth centers; educators; and representatives from heritage protection and restoration services, among others.

The archaeological summer school is structured around theoretical instruction, practical workshops, hands-on training, and masterclasses—all centered on the excavation process itself.

Figure 2. Students and instructors during an open-air archaeological lesson

Archaeological Summer School and Education: Practical Integration

The collaborative efforts of summer school participants—spanning the domains of school-community, school-family, school-archaeologist, and school-educator cooperation—create favorable conditions for effective educational reform and practical integration. These collaborative relationships are among the core criteria for ensuring the quality of education within the archaeological summer school framework.

When assessing the effectiveness of the summer school's operations, one of the key indicators is the level of awareness and engagement achieved among the participants. Transforming them into active stakeholders in the learning process is central to the leadership and management policies of the school. These considerations are not limited to theoretical or scientific perspectives but are rooted in practical evaluation and real-world implementation [1].

Two core indicators define teaching efficiency in archaeological summer schools: **time** and **value**. If higher-quality learning outcomes can be achieved using fewer resources and less time compared to traditional methods, the process is considered efficient. Productivity, in this context, is measured by the ratio of learning outcomes to the pedagogical effort invested. In other words, if greater instructional effectiveness and learning quality are attained with minimal effort, the result is deemed productive.

Therefore, when evaluating innovation within archaeological summer schools, **efficient learning** and **high-quality practical training** are considered primary indicators. This implies that the innovations implemented not only enhance the productivity of learning but also increase the overall efficiency of the educational process (see Figure 3).

Archaeological summer schools also represent the emergence of new educational content and forms—ranging from teaching materials, academic curricula, and textbooks to knowledge systems and innovative educational products or services.

Figure 3. Field-based archaeological masterclasses

Visualization and Creative Transformation of Knowledge

A core principle of modern education lies in reinforcing theoretical knowledge acquired in both secondary and higher education with tangible demonstrations, transforming this knowledge into creative competencies. Instructional programs in educational institutions that foster creativity stimulate innovative processes during archaeological summer schools. Practical coordination, direct observation, and visits to archaeoparks or active excavation sites enable students to draw analogies, transfer ideas creatively and laterally from one context to another, integrate knowledge across disciplines, generate unconventional ideas, anticipate overarching frameworks, and analyze diverse cognitive approaches [1, pp. 234–235].

Observing archaeological excavations and visiting archaeoparks within the summer school context provides a multidimensional archaeological experience. It allows students to engage with the content actively, supports the evaluation of creative activities, and motivates participants to articulate their perspectives on the process. As part of the curriculum, students, volunteers, and participants gain firsthand exposure to ancient tools—made of stone, bone, or metal—as well as diverse ceramic artifacts, ornaments and beads fashioned from precious and semi-precious stones (such as agate, jasper, opal, aragonite, basalt, etc.) and various metals (iron, gold, bronze, etc.). They also observe examples of weaponry (arrowheads, spear tips, battle axes, swords, defensive arms, etc.). This live interaction not only piques interest but also stimulates logical reasoning and critical thinking skills [11, 56 p.].

The Role of Archaeological Summer Schools in Promoting Cultural Heritage

Archaeological summer schools play a significant role in the promotion and dissemination of tangible cultural heritage. Overall, they fulfill three core functions: integrating education and science, facilitating practical field experience in education, and promoting awareness and recognition of material-cultural heritage. While the first two have been addressed earlier, the third is of particular importance, as it focuses on raising public awareness of archaeological and historical monuments.

The primary focus of archaeological summer school audiences is the excavation site itself. When participants arrive at the excavation area, the archaeologist plays a crucial introductory role by welcoming them and providing

background on the site, including its historical, archaeological, and sometimes architectural significance, and explaining why this specific location was selected for excavation [13, pp. 51–52]. This constitutes the initial phase.

Subsequently, participants are introduced to the excavation area. At this stage, it is important to note that the field archaeologist assumes multiple roles: as a guide, an informant, a practical instructor, and a lecturer in an open-air classroom setting [4]. They must engage the audience effectively, spark interest in the excavation work, and inspire curiosity. The archaeologist should respond to participant questions with enthusiasm, provide accurate information, and convey comprehensive insights into the archaeological-historical context of the site.

Moreover, the archaeologist should explain the typologies of monuments, the chronological classification of habitation and burial sites, the categorization and comparative analysis of discovered material-cultural remains, and relevant analogies (see Figure 5). The archaeologist must also guide participants in conducting supervised excavations, facilitate initial field documentation of the findings, and oversee this process with professional diligence [14, pp. 42–43].

Figure 4. Familiarization with an archaeological monument

Naturally, masterclasses conducted in field settings play a crucial role in the promotion of tangible cultural heritage. Members of the archaeological summer school become acquainted with archaeological monuments, which fosters a sense of national pride and patriotism, deepens their interest in history, and cultivates appreciation for cultural heritage. Each participant, by sharing their impressions with peers, also assumes the role of an informal communicator, thereby contributing to the expansion and outreach of the summer school network [16].

In recent years, one of the most exemplary models of an archaeological summer school has been the project titled *"Archaeological Excavations and Summer School at Keşikçidağ"*, implemented by the Keşikçidağ State Historical and Cultural Reserve. For the past five consecutive years, the reserve has achieved significant milestones in this area. The archaeological excavations are carried out by archaeologists from the Institute of Archaeology and Anthropology of the Azerbaijan National Academy of Sciences (ANAS), under the framework of a formal memorandum of cooperation signed between the Institute and the Keşikçidağ Reserve[17] .

The excavations take place in the Bronze Age kurgan burial mounds located on the Ceyrançöl plain, within the administrative boundaries of the Keşikçidağ State Historical and Cultural Reserve. Dozens of kurgans have been excavated across sites such as Sarıyoxuş, Karvan Valley, Qaltan Plain, Qarasoy, Sarısu, Candargöl, and Yovşanlıdərə, revealing numerous valuable examples of material culture [2; 5; 6; 7].

In accordance with the memorandum, the recovered artifacts are stored and exhibited at the administrative headquarters of the reserve. These artifacts are displayed year-round and are accessible to all participants. The most recent project realized by the reserve was the *"Scientific-Archaeological Excavations and Summer School at Keşikçidağ-5"*, conducted in the current year. This initiative reached an audience of more than 2,000 participants, including students and educators from regional universities, secondary and vocational institutions, museum staff, cultural heritage preservation and restoration specialists, volunteers, youth center members, and reserve employees, all of whom had the opportunity to observe the excavation process firsthand.

Young participants who joined the excavations followed the process with great enthusiasm and curiosity, acquiring a wealth of information about the discoveries. The progress and results of the excavation were covered by over 100 local and international media outlets and websites, receiving widespread positive feedback. The staff of the reserve have accumulated considerable experience in organizing and managing the summer school programs. Particularly noteworthy is the recurring participation of secondary school students and university undergraduates and postgraduates in the excavation sites. Their direct engagement fostered deep interest in archaeology and history and significantly encouraged respectful and attentive attitudes toward national heritage.

Figure 5. Archaeological summer school students during excavation.

The archaeological summer schools organized by the **Keşikçidağ State Historical-Cultural Reserve** can serve as a model in this field. The careful design of the school program, formation and organization of the student body, invitation of archaeologists, execution of excavations, dissemination and discussion of results, and ultimately, the scientific-practical seminars and open lessons—all reflect a unified program with a defined scientific orientation and demonstrate the integration of practical experience into education.

Conclusion

Archaeological summer schools play a vital role in fostering engagement with the discipline of archaeology among the younger generation—including school pupils, university students, and volunteers—as well as among the educators guiding them. These programs facilitate the development of interest in archaeology, enhance familiarity with archaeological monuments, offer opportunities to observe excavation processes firsthand, and enable participants to engage directly with material remains under the supervision of professional archaeologists.

Such experiences undoubtedly leave participants with a scientific understanding of how archaeological excavations are conducted. Observing and physically interacting with artifacts that have been buried for centuries or even millennia deepens one's knowledge of ancient history and reinforces theoretical learning through practical fieldwork. Direct engagement helps cultivate abstract thinking and allows participants to visualize the socio-political and religious aspects of prehistoric periods.

From this perspective, archaeological summer schools not only provide academic and practical education but also present history in a tangible and experiential manner. In the Republic of Azerbaijan, further improvement of archaeological summer school program designs and the development of these initiatives through the expertise of experienced institutions should be a priority. Expanding the audience for such projects, which shed light on the traces of our ancient history, is essential. Archaeological summer schools have significant value for the study and promotion of both local and national historical heritage.

Acknowledgement

The authors would like to express their sincere gratitude to the administrative teams of the Keshikchidagh State Historical-Cultural Reserve and the Avey State Historical-Cultural Reserve for their invaluable support and collaboration throughout the development and implementation of the archaeological summer schools. Special thanks are extended to the Institute of Archaeology and Anthropology of the Azerbaijan National Academy of Sciences for providing scientific guidance and resources essential to this project. The contributions of all participants, including students, volunteers, and local community members, are deeply appreciated for their active engagement in promoting cultural heritage and practical education.

Conflict of Interest

The authors declare that there is no conflict of interest regarding the publication of this article. The research and outcomes presented are independent and unbiased, with no financial or personal relationships that could have influenced the work.

Introduction

In recent years, a new term has emerged in archaeological practice and theoretical science: *archaeological summer school*. The establishment of such schools, including the development of their curricula, selection of participants, formation of the audience, and definition of their scientific direction, must be conducted professionally and systematically. Archaeological summer schools serve as educational and cultural initiatives aimed at promoting the discipline of archaeology among secondary and university students, advancing the study of ancient history, publicizing our tangible cultural heritage, and contributing to the identification and recognition of archaeological monuments.

In Azerbaijan, especially in recent years, archaeological summer schools have seen a growing audience, supported by the formation of professional teaching and training teams in this field. The primary objective is, naturally, to study the earliest traces of our historical memory and to disseminate this knowledge more widely among the younger generation. However, a key aspect is not only the study of ancient heritage but also the inclusion of archaeological, historical, and architectural monuments from various historical periods as subjects of academic inquiry and instruction.

The organization and direction of archaeological summer schools may involve one or several institutions and research centers. For this purpose, the coordinating institution must establish effective scientific oversight and ensure the orderly execution of fieldwork. This is particularly crucial because a substantial part of archaeological summer school activities consists of outdoor research, including archaeological excavations (see Figure 1).

An *archaeological summer school* is a structured program that focuses on the instruction of archaeology in outdoor field conditions, combining practical training with the theoretical knowledge acquired through formal education. It aims to bridge classroom learning and field application by revisiting and reinforcing theoretical concepts through the material-cultural remains uncovered during archaeological excavations.

The foundation of an archaeological summer school lies in the synthesis of information obtained from the study of archaeology as a scientific discipline—particularly ancient and medieval history in secondary school curricula and archaeology courses in university-level programs—with hands-on experience in open-air excavation environments. In secondary school history textbooks, archaeological excavations are generally covered within narrow limits. Only a small portion of the findings from excavations conducted in the country or globally is conveyed to students. Some recent archaeological excavations, particularly those involving newly discovered monuments, caves, open-air campsites, settlement sites (both urban and rural), necropolises, fortresses, cyclopean structures, places of worship, and shelters—although not presented in full depth—are partially introduced to students. Naturally, providing complete and detailed information on all such discoveries would considerably increase the academic load and risk overwhelming students with excessive archaeological detail.

Figure 1. Students of the Archaeological Summer School at the Qarasoy Kurgans (2023, Keşikçidağ State Historical and Cultural Reserve, Aghstafa District)

What is an Archaeological Summer School?

At the university level, archaeology is taught for a limited duration within history departments, while students from non-history faculties receive only a brief introduction to historical subjects, with minimal reference to archaeological methods or findings. Nonetheless, students are exposed to a degree of information on archaeological excavations and material-cultural heritage (see Figure 2).

Archaeological summer schools serve as platforms where theoretical knowledge acquired in both secondary and higher education is revisited and integrated within the context of actual field excavations. Their objective is to reinforce classroom-based learning with practical experience, deliver knowledge directly at the excavation site, and demonstrate that pre-written history can only be understood through archaeological sources [1].

Structure and Pedagogy of the Archaeological Summer School

An archaeological summer school must be based on a pre-established academic workload and curriculum. The participants should form a motivated and disciplined audience, capable of adapting to outdoor training conditions. This audience is not limited to students, university faculty, or schoolteachers. It may also include volunteers; young professionals working in scientific, medical, industrial, and public service sectors; staff from institutions and enterprises; employees of history and ethnography museums, historical-cultural and nature reserves; personnel from youth centers; educators; and representatives from heritage protection and restoration services, among others.

The archaeological summer school is structured around theoretical instruction, practical workshops, hands-on training, and masterclasses—all centered on the excavation process itself.

Figure 2. Students and instructors during an open-air archaeological lesson

Archaeological Summer School and Education: Practical Integration

The collaborative efforts of summer school participants—spanning the domains of school-community, school-family, school-archaeologist, and school-educator cooperation—create favorable conditions for effective educational reform and practical integration. These collaborative relationships are among the core criteria for ensuring the quality of education within the archaeological summer school framework.

When assessing the effectiveness of the summer school's operations, one of the key indicators is the level of awareness and engagement achieved among the participants. Transforming them into active stakeholders in the learning process is central to the leadership and management policies of the school. These considerations are not limited to theoretical or scientific perspectives but are rooted in practical evaluation and real-world implementation [1].

Two core indicators define teaching efficiency in archaeological summer schools: **time** and **value**. If higher-quality learning outcomes can be achieved using fewer resources and less time compared to traditional methods, the process is considered efficient. Productivity, in this context, is measured by the ratio of learning outcomes to the pedagogical effort invested. In other words, if greater instructional effectiveness and learning quality are attained with minimal effort, the result is deemed productive.

Therefore, when evaluating innovation within archaeological summer schools, **efficient learning** and **high-quality practical training** are considered primary indicators. This implies that the innovations implemented not only enhance the productivity of learning but also increase the overall efficiency of the educational process (see Figure 3).

Archaeological summer schools also represent the emergence of new educational content and forms—ranging from teaching materials, academic curricula, and textbooks to knowledge systems and innovative educational products or services.

Figure 3. Field-based archaeological masterclasses

Visualization and Creative Transformation of Knowledge

A core principle of modern education lies in reinforcing theoretical knowledge acquired in both secondary and higher education with tangible demonstrations, transforming this knowledge into creative competencies. Instructional programs in educational institutions that foster creativity stimulate innovative processes during archaeological summer schools. Practical coordination, direct observation, and visits to archaeoparks or active excavation sites enable students to draw analogies, transfer ideas creatively and laterally from one context to another, integrate knowledge across disciplines, generate unconventional ideas, anticipate overarching frameworks, and analyze diverse cognitive approaches [1, pp. 234–235].

Observing archaeological excavations and visiting archaeoparks within the summer school context provides a multidimensional archaeological experience. It allows students to engage with the content actively, supports the evaluation of creative activities, and motivates participants to articulate their perspectives on the process. As part of the curriculum, students, volunteers, and participants gain firsthand exposure to ancient tools—made of stone, bone, or metal—as well as diverse ceramic artifacts, ornaments and beads fashioned from precious and semi-precious stones (such as agate, jasper, opal, aragonite, basalt, etc.) and various metals (iron, gold, bronze, etc.). They also observe examples of weaponry (arrowheads, spear tips, battle axes, swords, defensive arms, etc.). This live interaction not only piques interest but also stimulates logical reasoning and critical thinking skills [11, 56 p.].

The Role of Archaeological Summer Schools in Promoting Cultural Heritage

Archaeological summer schools play a significant role in the promotion and dissemination of tangible cultural heritage. Overall, they fulfill three core functions: integrating education and science, facilitating practical field experience in education, and promoting awareness and recognition of material-cultural heritage. While the first two have been addressed earlier, the third is of particular importance, as it focuses on raising public awareness of archaeological and historical monuments.

The primary focus of archaeological summer school audiences is the excavation site itself. When participants arrive at the excavation area, the archaeologist plays a crucial introductory role by welcoming them and providing

background on the site, including its historical, archaeological, and sometimes architectural significance, and explaining why this specific location was selected for excavation [13, pp. 51–52]. This constitutes the initial phase.

Subsequently, participants are introduced to the excavation area. At this stage, it is important to note that the field archaeologist assumes multiple roles: as a guide, an informant, a practical instructor, and a lecturer in an open-air classroom setting [4]. They must engage the audience effectively, spark interest in the excavation work, and inspire curiosity. The archaeologist should respond to participant questions with enthusiasm, provide accurate information, and convey comprehensive insights into the archaeological-historical context of the site.

Moreover, the archaeologist should explain the typologies of monuments, the chronological classification of habitation and burial sites, the categorization and comparative analysis of discovered material-cultural remains, and relevant analogies (see Figure 5). The archaeologist must also guide participants in conducting supervised excavations, facilitate initial field documentation of the findings, and oversee this process with professional diligence [14, pp. 42–43].

Figure 4. Familiarization with an archaeological monument

Naturally, masterclasses conducted in field settings play a crucial role in the promotion of tangible cultural heritage. Members of the archaeological summer school become acquainted with archaeological monuments, which fosters a sense of national pride and patriotism, deepens their interest in history, and cultivates appreciation for cultural heritage. Each participant, by sharing their impressions with peers, also assumes the role of an informal communicator, thereby contributing to the expansion and outreach of the summer school network [16].

In recent years, one of the most exemplary models of an archaeological summer school has been the project titled *"Archaeological Excavations and Summer School at Keşikçidağ"*, implemented by the Keşikçidağ State Historical and Cultural Reserve. For the past five consecutive years, the reserve has achieved significant milestones in this area. The archaeological excavations are carried out by archaeologists from the Institute of Archaeology and Anthropology of the Azerbaijan National Academy of Sciences (ANAS), under the framework of a formal memorandum of cooperation signed between the Institute and the Keşikçidağ Reserve[17] .

The excavations take place in the Bronze Age kurgan burial mounds located on the Ceyrançöl plain, within the administrative boundaries of the Keşikçidağ State Historical and Cultural Reserve. Dozens of kurgans have been excavated across sites such as Sarıyoxuş, Karvan Valley, Qaltan Plain, Qarasoy, Sarısu, Candargöl, and Yovşanlıdərə, revealing numerous valuable examples of material culture [2; 5; 6; 7].

In accordance with the memorandum, the recovered artifacts are stored and exhibited at the administrative headquarters of the reserve. These artifacts are displayed year-round and are accessible to all participants. The most recent project realized by the reserve was the *"Scientific-Archaeological Excavations and Summer School at Keşikçidağ-5"*, conducted in the current year. This initiative reached an audience of more than 2,000 participants, including students and educators from regional universities, secondary and vocational institutions, museum staff, cultural heritage preservation and restoration specialists, volunteers, youth center members, and reserve employees, all of whom had the opportunity to observe the excavation process firsthand.

Young participants who joined the excavations followed the process with great enthusiasm and curiosity, acquiring a wealth of information about the discoveries. The progress and results of the excavation were covered by over 100 local and international media outlets and websites, receiving widespread positive feedback. The staff of the reserve have accumulated considerable experience in organizing and managing the summer school programs. Particularly noteworthy is the recurring participation of secondary school students and university undergraduates and postgraduates in the excavation sites. Their direct engagement fostered deep interest in archaeology and history and significantly encouraged respectful and attentive attitudes toward national heritage.

Figure 5. Archaeological summer school students during excavation.

The archaeological summer schools organized by the **Keşikçidağ State Historical-Cultural Reserve** can serve as a model in this field. The careful design of the school program, formation and organization of the student body, invitation of archaeologists, execution of excavations, dissemination and discussion of results, and ultimately, the scientific-practical seminars and open lessons—all reflect a unified program with a defined scientific orientation and demonstrate the integration of practical experience into education.

Conclusion

Archaeological summer schools play a vital role in fostering engagement with the discipline of archaeology among the younger generation—including school pupils, university students, and volunteers—as well as among the educators guiding them. These programs facilitate the development of interest in archaeology, enhance familiarity with archaeological monuments, offer opportunities to observe excavation processes firsthand, and enable participants to engage directly with material remains under the supervision of professional archaeologists.

Such experiences undoubtedly leave participants with a scientific understanding of how archaeological excavations are conducted. Observing and physically interacting with artifacts that have been buried for centuries or even millennia deepens one's knowledge of ancient history and reinforces theoretical learning through practical fieldwork. Direct engagement helps cultivate abstract thinking and allows participants to visualize the socio-political and religious aspects of prehistoric periods.

From this perspective, archaeological summer schools not only provide academic and practical education but also present history in a tangible and experiential manner. In the Republic of Azerbaijan, further improvement of archaeological summer school program designs and the development of these initiatives through the expertise of experienced institutions should be a priority. Expanding the audience for such projects, which shed light on the traces of our ancient history, is essential. Archaeological summer schools have significant value for the study and promotion of both local and national historical heritage.

Acknowledgement

The authors would like to express their sincere gratitude to the administrative teams of the Keshikchidagh State Historical-Cultural Reserve and the Avey State Historical-Cultural Reserve for their invaluable support and collaboration throughout the development and implementation of the archaeological summer schools. Special thanks are extended to the Institute of Archaeology and Anthropology of the Azerbaijan National Academy of Sciences for providing scientific guidance and resources essential to this project. The contributions of all participants, including students, volunteers, and local community members, are deeply appreciated for their active engagement in promoting cultural heritage and practical education.

Conflict of Interest

The authors declare that there is no conflict of interest regarding the publication of this article. The research and outcomes presented are independent and unbiased, with no financial or personal relationships that could have influenced the work.

Keywords higher education quality; university ranking; academic competitiveness; global education systems; quality assurance; bibliometric indicators

Abstract

The ranking and evaluation of higher education institutions have become a central mechanism for assessing academic quality and competitiveness in the global knowledge economy. Since 2003, various international organizations and research institutions have introduced methodologies to systematically rank universities based on multidimensional criteria, including web visibility, academic mobility, research output, citation frequency, faculty quality, graduate employability, labor market reputation, research leadership, and contributions to scientific impact as measured by bibliometric indicators such as the H-index. Prominent systems include the Academic Ranking of World Universities (ARWU), Webometrics Ranking of World Universities, QS–Times Higher Education Rankings, and the Performance Ranking of Scientific Papers for World Universities. While these rankings offer comparative benchmarks for global higher education, they also highlight disparities, as some national universities remain underrepresented. In response, several countries have developed national ranking frameworks to reflect local priorities and ensure representation in the international higher education landscape. This paper explores comparative ranking mechanisms as strategic tools for enhancing quality assurance in higher education and discusses their implications for policy, institutional reform, and sustainable development of academic excellence.

Introduction

The issue of quality assurance in higher education has gained increasing importance in recent decades. University ranking systems, first introduced in 2003, serve as a comparative mechanism for assessing institutional performance

worldwide. These systems apply diverse criteria such as digital presence, academic publications, teaching quality, research excellence, and graduate employability.

Internationally recognized rankings such as ARWU (Shanghai Jiao Tong University, 2003), Webometrics (Cybermetrics Lab, Spain, 2004), QS–THE (United Kingdom, 2004), and the Performance Ranking of Scientific Papers (Taiwan, 2007) have established benchmarks for evaluating universities globally. However, the absence of representation for certain countries has prompted the creation of national ranking frameworks to ensure that local higher education institutions are evaluated according to both international and national standards.

This paper examines these comparative mechanisms in depth, analyzing their strengths, limitations, and implications for quality enhancement in higher education.

Background

In the early years of international ranking initiatives, many universities across different countries (e.g., Argentina, Australia, Brazil, Canada, Chile, Pakistan, and Ukraine) were excluded from global evaluations. This exclusion was largely due to several limitations: the absence of English-language versions of institutional websites, the failure to publish research outputs online, and the lack of articles published in international academic databases on behalf of these institutions. Consequently, national ranking mechanisms began to emerge to address these gaps. In post-Soviet states, Russia initiated national university ranking exercises in 2004 under the supervision of the Ministry of Education (implemented by the Patani Charity Society). Kazakhstan followed in 2006, launching its own ranking system to measure the performance of higher education institutions.

In Azerbaijan, the establishment of a national ranking system was initiated under the order of the Minister of Education of the Republic of Azerbaijan (Order No. 842, dated 11 October 2013). This initiative emerged as part of the "Competition for Supporting Public Initiatives," particularly through the projects Educational Policy Initiatives and Research Initiatives in Education. The strategic foundation for this undertaking was reinforced by the State Strategy for the Development of Education in the Republic of Azerbaijan, approved by Presidential Decree on 24 October 2013. The project executor was the Organization of Specialists Educated Abroad (AKTAM). Within the framework of the project Defining the Ranking of Higher Education Institutions in the Republic of Azerbaijan, a set of proposals was developed to create a national ranking mechanism aimed at ensuring the representation of Azerbaijani universities in international evaluation systems. Given the dynamic nature of global science and the rapidly evolving labor market, the development of a flexible and robust national ranking model for Azerbaijan is now considered an urgent necessity.

Research Aim

The purpose of this study is threefold:

- To analyze the establishment and historical evolution of international, national, and subject-specific ranking systems, highlighting their necessity and strategic directions.
- To identify parameters for ranking secondary specialized education institutions, including semester and final examinations, state exams, academic qualifications of teaching staff, research productivity, creative achievements, and admission performance of graduates into higher education institutions.
- To propose recommendations for improving faculty quality, citation frequency of academic works, graduate employability, institutional reputation in the labor market, admission rates of international students, leadership in scientific research, and the significance of research output.

Research Object

The object of this study is the system of international, national, and subject-specific ranking mechanisms of higher education institutions.

Research Subject

The subject of this study is the identification of principal parameters and indicators that ensure the alignment of higher education institutions with international, national, and subject-specific ranking systems.

Scientific Novelty

This research provides a theoretical generalization and justification of ranking mechanisms as instruments for enhancing the quality of higher education. The novelty lies in comparing higher and secondary specialized education institutions through ranking models, while also determining the level at which international experience can be applied to Azerbaijan's higher education system.

The study underscores the necessity of establishing a scientifically grounded methodology that considers the current state of higher education in Azerbaijan. It also examines how international best practices in quality assessment and ranking can be adapted to national needs. This analysis represents an important contribution to both pedagogical theory and the practice of higher education quality management.

International, National, and Subject-Specific Ranking Systems

The development of a higher education system is a key indicator of a nation's overall socio-economic status, quality of life, and level of social development. To measure such progress and ensure accountability, both international and national standards are necessary.

However, no ranking system can be considered entirely objective, nor do the existing systems align perfectly with one another. This is because quality indicators and achievements of universities cannot be fully captured by numerical values alone. To address this challenge, UNESCO's Higher Education Centre, in collaboration with an international expert group, developed the Berlin Principles—a framework of 16 guidelines designed to ensure transparency and comparability in ranking systems.

Although universities differ significantly in terms of faculty profiles, student populations, and disciplinary orientations (e.g., medicine, engineering, mathematics, architecture), the evaluation of research publications has been universally recognized as a key principle.

The measurability of quality and performance is enabled through reliable datasets and numerical indicators. Accordingly, each university can align its mission and vision with both international and national ranking standards to integrate more effectively into global education systems. Among the most widely recognized systems in international practice are the QS World University Rankings, Times Higher Education (THE), and the Academic Ranking of World Universities (ARWU–Shanghai Ranking).

3. Leading International University Ranking Systems

3.1. QS World University Rankings

Since 2004, the QS World University Rankings, developed by the company Quacquarelli Symonds, has assessed universities globally using a combination of academic and employer-based criteria. Institutions are evaluated across four main categories, with each factor contributing a maximum of 100 points. In addition to overall ranking, QS also evaluates performance by subject areas and faculties.

Table 3.1.1. Calculation Criteria for QS World University Rankings

Factor	Indicator	Description	Weighting (%)
Research Quality	Academic reputation	Score based on peer review	40
	Faculty research	Citation rate of	20

	citations	academic staff publications	
Graduate Employability	Employer reputation	Employer survey results	10
Internationalization	International faculty	Number of foreign academic staff	5
	International students	Number of enrolled foreign students	5
Teaching Quality	Faculty-to-student ratio	Ratio of faculty to students	20

3.2. Academic Ranking of World Universities (ARWU – Shanghai Ranking)

The Academic Ranking of World Universities (ARWU), initiated in 2003 by the Shanghai Jiao Tong University Ranking Committee, annually publishes a list of the world's top 500 universities. Initially, ARWU aimed to compare Chinese universities with leading global institutions. Over time, ARWU has become one of the most respected systems due to its robust, transparent, and evidence-based evaluation methodology.

Table 3.2.1. Calculation Criteria for ARWU – Shanghai Ranking

Factor	Indicator	Code	Weighting (%)
Education Quality	Alumni and faculty winning Nobel Prizes	Alumni	10
Faculty Excellence	Staff receiving field medals	Award	20
	Highly cited researchers in 21 fields	HiCi	20
Research Output	Publications in Nature and Science	N&S	20
	Publications indexed in SCI-Expanded and SSCI	SCI	20
Institutional Size	Performance relative to university size	Size	10
Total			100

3.3. Other Influential International Ranking Systems

Several additional reputable systems also contribute to the global evaluation of universities:

1. Newsweek Global Universities Ranking – Top 100 global universities.
2. Webometrics Ranking of World Universities – Developed by the Cybermetrics Laboratory, Spain.
3. Google Search G-Factor Ranking – Based on Google indexing and references.
4. MINES Professional Ranking – Evaluates universities specializing in engineering and technology.
5. HEETACT – Performance Ranking of Scientific Papers for World Universities, developed by Taiwan's Higher Education Evaluation and Accreditation Council.
6. Leiden Ranking – Conducted by the Centre for Science and Technology Studies (CWTS), Leiden University, Netherlands.
7. SCImago Institutions Ranking – Uses Scopus data to compare over 17,000 journals and institutions.
8. Global University Ranking – Compiled by Wuhan University, China.

4. The Case of Azerbaijan: Towards a National Ranking System

In Azerbaijan, the creation of a national ranking system for higher education institutions has become essential. Several indicators are particularly emphasized to align national universities with international standards:

4.1. Academic and Teaching Staff Indicators

- Ratio of professors to students.
- Ratio of doctors of science to students.
- Ratio of associate professors to students.
- Ratio of PhD holders to students.
- Ratio of staff without academic degrees to students.
- Ratio of foreign faculty to students.
- Ratio of master's students to total students.
- Ratio of foreign master's students to total students.
- Ratio of doctoral candidates to students.
- Ratio of foreign doctoral candidates to students.
- Ratio of foreign undergraduate students to total students.

4.2. Research and Scientific Activity Indicators

- Number of scientific publications per academic staff member.
- Number of international publications per academic staff member.
- Number of publications in impact factor journals per academic staff member.
- Number of monographs per academic staff member.
- Number of textbooks and teaching manuals per academic staff member.
- Number of patents registered in Azerbaijan per academic staff member.
- Number of patents registered abroad per academic staff member.
- H-index of faculty across disciplines.

4.3. University Web Presence Indicators

- Number of external citations/links to the university website.
- Number of valuable files available on the website.
- Number of internal pages and directories on the university website.
- Quality and functionality of the university website.

5. The Berlin Principles on Ranking Higher Education Institutions

In 2004, the European Centre for Higher Education (UNESCO-CEPES) and the Institute for Higher Education Policy (United States) convened an international expert group on ranking. This group formulated the Berlin Principles on Ranking of Higher Education Institutions (Berlin, May 2006), which presented general principles and standardized methodologies for university rankings (Hazelkorn, 2015; UNESCO, 2006).

According to these principles, university rankings should be established across three independent categories:
1. Academic resources and institutional capacity – including faculty qualifications, student achievements, teaching quality, financial resources, and infrastructure.
2. Internal evaluation – assessments by teachers and students within the institution.
3. External evaluation – employer assessments of graduates, including input from national and local authorities, as well as large and small enterprises.

Within each category, numerous criteria are applied. For example, the academic resources category includes seven criteria and thirty-nine indicators, with data collected directly from universities. Students answer structured questionnaires in seven groups, while faculty and students participate in surveys. To assess graduate employability, both public and private organizations provide information on recent hires, thereby identifying universities whose graduates are most successful in the labor market.

Thus, the overall ranking of a higher education institution is determined by aggregating materials collected across these three categories. Predetermined evaluation scores cover resources, faculty quality, student performance, the proportion of international students, research capacity, financial management, admissions, teaching results, international collaboration, and socio-cultural activities.

6. Principles for Developing a National Ranking in Azerbaijan

The application of ranking systems in Azerbaijan must consider both international guidelines and local specificities. The following guiding principles are emphasized:

- Recognition of the diversity of institutions and their missions (state vs. private universities).
- Consideration of Azerbaijan's linguistic, cultural, economic, and historical contexts, alongside careful adaptation of international practices.
- Reliance on verified and independent sources of data.
- Implementation of organizational rules that enhance the credibility of rankings.
- Ensuring transparency of factors and methodologies used in rankings so that end-users clearly understand them.

The objectives of establishing a national ranking are as follows:

1. To provide reliable information for decision-making to stakeholders (prospective students, parents, policymakers, employers, and international organizations).
2. To stimulate competition and development among universities.
3. To encourage the creation and strengthening of internal quality assurance centers.
4. To identify levels of academic autonomy and integrity within universities.
5. To promote self-governance and accountability in higher education institutions.

7. Academic Staff Evaluation Criteria

Globally, evaluation of academic staff quality is based on relatively common parameters, such as Nobel or Fields awards, citation frequency, and overall reputation. For example, at the University of North Carolina (USA), academic staff are evaluated across three dimensions (Shin & Toutkoushian, 2011):

1. Teaching and curricular development
   - Academic qualifications by discipline.
   - Course design and delivery.
   - Supervision of student research.
   - Mentorship of teaching assistants.
   - Development of new curricula.

2. Research, creativity, and professional contributions
   - Peer-reviewed publications.
   - Conference presentations.
   - Creative works and innovations.

3. Service to university, community, and profession
   - Contributions to university governance.
   - Public engagement and media presence.
   - Professional service activities.

Portfolios are prepared for each staff member, and the results of evaluation determine reappointment, promotions, or tenure.

8. Graduate Employability and Socio-Economic Impact

Graduate employability and reputation in the labor market remain key ranking factors. Employer surveys and evaluations typically consider:

- Professional qualifications and skills.
- Readiness for full-time work.
- Ability to transition between different activities.
- Capacity for teamwork and leadership.
- Creativity and problem-solving abilities.
- Strength of fundamental and theoretical training.

Graduates are also assessed for their post-education benefits, classified into four categories: public economic, public social, private economic, and private social benefits (OECD, 2019).

Table 8.1. Socio-Economic Benefits of Higher Education Graduates

Public Economic Benefits	Public Social Benefits	Private Economic Benefits	Private Social Benefits
Increased tax revenues	Reduced crime rates	Higher living standards	Better health and longevity
Increased productivity	Growth in donations and social services	Easier entry into labor markets	Better welfare for children
Increased consumption	Enhanced civic responsibility	Greater investment capacity	More rational consumer decisions
Improved labor adaptability	Social cohesion and equality	Improved working conditions	Higher individual social status
Reduced state dependency	Improved technological adaptability	Career mobility	Increased leisure and cultural activities

9. International Comparison: Graduate Employment Rates

According to Eurostat data, employment rates of graduates aged 20–34 who completed higher education within the last three years vary significantly across Europe (Eurostat, 2022). The highest rate was recorded in Malta (96.7%), followed by Iceland (95.8%) and the Netherlands (94.8%). Other examples include:

- Germany – 94.3%
- United Kingdom – 88.4%
- Finland – 88.3%
- France – 84.4%
- Spain – 77.9%
- Turkey – 64.2%
- Italy – 62.8%
- Greece – 59.0%

These figures demonstrate significant variation across countries, underscoring the importance of aligning national ranking systems with labor market outcomes.

10. Research Leadership and Evaluation of Scientific Output

10.1. The Concept of the Research University

The notion of the research university originated in 1818 with the model of Humboldt University in Germany. Over two centuries, this tradition has created the foundations for integrating teaching and research while maintaining institutional diversity in missions and visions (Altbach, 2011; Clark, 1995). The status of a research university requires clear commitments to advanced inquiry and innovative research productivity.

All major international ranking systems allocate significant—sometimes predominant—weight to research performance and scientific publications. For universities in the Republic of Azerbaijan to achieve higher representation in these rankings, the primary condition is the recruitment and retention of professional, productive researchers, alongside the provision of favorable working conditions and structured career development opportunities.

When productive researchers are engaged, any higher education institution can legitimately claim the status of a "research university" or "research-based institution," provided it meets the following requirements:

- Recruitment of highly skilled academic staff with strong research capabilities.
- Allocation of additional time for faculty to conduct research.
- Provision of financial resources to support research activities.
- Establishment of appropriate research infrastructure.
- Involvement of doctoral candidates and research assistants in institutional projects.
- Prioritization of scholarly publications in faculty evaluation and promotion processes.

10.2. Metrics for Assessing Research Output

The evaluation of research performance and scientific publications relies on several metrics of varying significance:

1. Total number of publications – Useful as a measure of productivity but limited in reflecting the impact or quality of research.
2. Total number of citations – Indicates the utility of research by demonstrating how often it is used as a reliable reference in subsequent studies.
3. Citations per publication – Balances productivity and impact by enabling comparison between experienced scholars with many publications and early-career researchers with fewer outputs. However, since citations often require several years to accumulate, this measure can sometimes disadvantage highly productive scholars.
4. High-impact publications – Emphasis on outputs that exceed a specific citation threshold (e.g., five or more citations), highlighting contributions that are widely recognized and influential.
5. H-index – Introduced in 2005 by Argentine-American physicist Jorge Hirsch (Hirsch, 2005), the h-index measures both productivity and citation impact. It reflects the number of publications (h) that have received at least h citations each.

Mathematically:

$$h\text{-}index = n_a$$

where n_a represents the number of papers (h) that have been cited at least h times.

For example, ten citations to one article are equivalent to one citation each for ten articles—both cases yield an h-index of 1.

10.3. Strengths and Limitations of the H-index

The h-index, sometimes referred to as the Hirsch index, is widely used to evaluate scientific productivity and professional reputation. While it provides a more balanced measure compared to total publications or citations alone, it still presents limitations by reducing scholarly achievement to a single numerical value.

Nevertheless, the h-index is considered more reliable than raw counts of publications or citations, as it excludes:
- Authors with only one or two highly cited publications without sustained research activity.
- Researchers with multiple low-impact publications that receive minimal citations.

Thus, the h-index encourages not only higher publication output but also greater emphasis on producing impactful and frequently cited work (Bornmann & Daniel, 2007; Egghe, 2006).

11. The H-index and Its Application in Ranking Systems

11.1. Formal Definition of the H-index

Figure 1.3.1 illustrates the dependency graph of the h-index value. Formally, if we let f(i) represent the citation count of the i-th publication, the h-index can be computed as follows:

- Arrange the citation counts in descending order.

- Identify the last position in the sequence where the number of citations f(i) is greater than or equal to its rank i. This position corresponds to the h-index.

For example:

- An author with five publications (A, B, C, D, E) receiving 10, 8, 5, 4, and 3 citations respectively has an h-index of 4, because the fourth publication received 4 citations, while the fifth received only 3.
- Another author with five publications receiving 25, 8, 5, 3, and 3 citations has an h-index of 3, because the fourth publication received only 3 citations.

Mathematically:

$$h\text{-}index(f) = max_i \, min(f(i), i)$$

where f(i) is the number of citations for publication i.

It should be noted that the h-index is automatically calculated and displayed in platforms such as Google Scholar, eliminating the need for manual calculation.

11.2. Strategies for Increasing the H-index

In the competitive academic environment, researchers may seek to increase their h-index through two main approaches:

1. Self-citation of previous work in new research publications.

2. Increasing the total number of publications, even if each receives only a small number of citations.

11.2.1. Motivations for Self-Citation

Authors may cite their previous work for several reasons (Bartneck & Kokkelmans, 2011; Ioannidis, 2015):
- To update and improve earlier studies.
- To enhance visibility of prior work by linking it in higher-ranked journals.
- To ensure previous findings remain in circulation within the scientific literature.
- To promote new work by drawing attention to earlier publications.
- To revive poorly cited or overlooked studies.
- To strengthen their reputation as an expert within a field.
- To reinforce the methodological soundness of previous work by offering additional supporting examples.
- To increase overall citation counts numerically.

11.2.2. Increasing Publication Volume

Alternatively, even with few citations per paper, a greater number of publications raises the probability of being cited, which in turn contributes to a higher h-index.

11.3. Limitations of the H-index

The applicability of the h-index differs across disciplines. For instance, in the humanities, social sciences, and mathematics, citation practices vary significantly, making direct cross-disciplinary comparisons problematic (Waltman & van Eck, 2012).

The h-index should therefore not be regarded as an optimal, universal mechanism for comparing scholarly impact across fields. Instead, it should be complemented with additional qualitative and quantitative indicators.

11.4. Conclusion

The creation of a national ranking system for higher education institutions in Azerbaijan requires attention to international best practices, particularly the integration of research metrics. The following measures are critical:

- Ensuring universities maintain active, accessible websites that meet international standards.
- Increasing the publication of research outputs in impact factor journals.
- Expanding student and faculty exchange programs with foreign institutions.
- Recruiting highly skilled and productive researchers.
- Providing financial resources and infrastructure to support research.
- Integrating doctoral students and research assistants into institutional research projects.
- Emphasizing scholarly publications in faculty evaluation and promotion processes.

Although the h-index alone has limitations, it remains a more effective tool than raw publication or citation counts, as it balances productivity and impact. It also discourages unsustained research activity, since consistent publication and citation across multiple outputs are required to maintain a high score.

Rankings, therefore, function not only as an external quality assurance mechanism but also as a tool for self-improvement. Universities must interpret their relative positions as feedback for addressing weaknesses and promoting internal reforms. Importantly, the results of rankings should be transparent to government, society, parents, and most critically, prospective students.

Acknowledgement

The author expresses sincere gratitude to the Azerbaijan Institute of Education for institutional support and to colleagues from the Department of the Theory and History of Education for their valuable insights and academic collaboration during the preparation of this research.

Conflict of Interest

The author declares no conflict of interest related to this research.

Keywords Brièveté, Communication digitale, Etudiants, Expressivité, Facebook, Innovation linguistique

Abstract
S'inscrivant dans le champ de la sociolinguistique numérique, cette étude vise à examiner les pratiques communicationnelles des étudiants en français sur Facebook. Elle met en évidence une triple dynamique caractéristique de ces usages : la recherche de brièveté imposée par les contraintes de la plateforme, le besoin d'expressivité propre à cette population, et l'émergence d'une créativité linguistique spécifique aux environnements numériques. L'objectif est d'analyser les mécanismes par lesquels ces trois dimensions apparemment contradictoires s'articulent dans la communication étudiante en ligne, et de démontrer comment cette oscillation permanente peut générer des formes communicationnelles hybrides où les contraintes de brièveté incitent les utilisateurs à développer des stratégies expressives originales, transformant Facebook en véritable laboratoire d'innovation linguistique spontanée. L'analyse interroge ainsi les mutations contemporaines de la langue française dans les espaces digitaux et démontre comment ces jeunes locuteurs réinventent continuellement leur rapport à la langue française dans l'espace numérique, ce qui produit des pratiques communicationnelles qui dépassent les simples adaptations techniques pour devenir de véritables créations linguistiques collectives, preuve d'une appropriation créative des outils numériques.

Introduction

De nos jours, la communication digitale est bouleversée par la multiplication fulgurante des réseaux sociaux. Désormais omniprésents, ces plateformes s'imposent dans tous les domaines: stratégies marketing, communication politique et vie quotidienne. Ils constituent aujourd'hui des outils incontournables d'internet, et occupent une place centrale dans nos interactions numériques, quelle que soit l'audience visée.

Devenus indispensables au quotidien d'une immense partie de la population mondiale, ces réseaux évoluent constamment et transforment profondément nos modes de communication, d'information, de travail et de

consommation, tant dans la sphère personnelle que professionnelle. En soulignant que : *« les réseaux sociaux sont des médias sociaux devenus incontournables qui désignent un ensemble de services permettant de développer des conversations et des interactions sociales sur internet ou en situation de mobilité »*, Cavazza (2009) met en évidence la position centrale qu'ont acquise les réseaux sociaux dans notre quotidien. Ces plateformes sont devenues incontournables, touchant tous les aspects de notre vie : information, divertissement et communications personnelles. Cette omniprésence numérique a profondément modifié nos pratiques sociales, culturelles et économiques, et par conséquent, a redéfini notre rapport au monde et aux autres.

Définis par Rissoan comme étant : *« des sites internet qui répondent à un besoin de consommation de médias (vidéos, audio, textes, animations) mais dans un contexte de partage et d'échange »* (Rissoan, 2012, p : 26), les réseaux sociaux ont connu, depuis leur apparition et leur mise en application, une forte croissance et ont fait couler beaucoup d'encre. Facebook, X (ex Twitter), Instagram, Snapchat ont, en effet, généré un engouement tellement important aussi bien chez les particuliers, chez les professionnels, que chez les jeunes générations, particulièrement les étudiants qui constituent une population largement connectée.

En janvier 2025, Facebook compte plus de 3 milliards d'utilisateurs actifs mensuels dans le monde, ce qui en fait la plateforme sociale le plus utilisée à l'échelle mondiale et s'ouvre à de nouveaux publics de sorte qu'il soit rare de trouver un domaine où Facebook n'intervient pas. Par conséquent, la sphère estudiantine en a été touchée et Facebook s'est même implanté dans les habitudes des étudiants. A-L. Raffestin le confirme en disant que : *« Comme dans bien d'autres domaines, le réseau social de Mark Zuckerberg est le plus utilisé par les étudiants, mais aussi par leurs professeurs »* (Raffestin, 2011)

Il sera ainsi pour eux ce qu'ils veulent en faire dans la mesure où les outils proposés sont adaptés à leurs besoins de communication, d'information ou même de divertissement. Il est à noter que grâce à Facebook et aux nombreux outils de communication qu'il renferme, les étudiants développent leurs compétences à communiquer et peuvent donc s'ouvrir au savoir et partager l'information.

1. Problématique et objectifs de la recherche

Dans le cadre de cette étude, il est important de comprendre comment les réseaux sociaux numériques, en l'occurrence Facebook, ont profondément transformé les pratiques communicationnelles des jeunes étudiants. Facebook, en tant que plateforme pionnière du web social, a créé un espace de communication inédit où se déploient de nouvelles formes d'expression linguistique. La communication étudiante en français sur cette plateforme présente des caractéristiques singulières qui méritent une analyse approfondie : elle oscille entre contraintes techniques, besoins expressifs et innovations créatives.

Cette problématique soulève ainsi une question capitale, à laquelle il serait intéressant de pouvoir répondre : « *Comment les étudiants en français articulent-ils brièveté, expressivité et créativité linguistique dans leurs pratiques communicationnelles sur Facebook ?*»

De cette question principale, découlent des questions secondaires qui ouvrent plusieurs axes d'analyse structurés autour d'une triple dimension (brièveté, expressivité, créativité) :

- Comment les étudiants gèrent-ils la brièveté dans leurs messages tout en assurant la clarté du contenu ?
- Quels types de procédés expressifs sont privilégiés dans leurs échanges ?
- Quelles formes de créativité linguistique émergent dans leurs communications ?

Dans le but d'apporter des réponses à ces questions qui permettent d'explorer systématiquement les trois dimensions du sujet tout en tenant compte des spécificités du public étudiant francophone et du medium Facebook comme espace de communication, nous avancerons les hypothèses suivantes, qui feront par la suite l'objet d'une validation ou d'une réfutation à partir d'une enquête de terrain :

1. Les étudiants ont recours à des formes brèves, souvent elliptiques, pour gagner en rapidité et s'adapter aux usages numériques.

2. L'expressivité est renforcée par des procédés paralinguistiques (emojis, ponctuation excessive, majuscules), qui pallient l'absence de ton ou de gestuelle.

3. La créativité linguistique résulte de l'interaction entre les contraintes de la concision, l'invention de néologismes contextuels et l'alternance codique.

Dans le présent travail, il convient de souligner la diversité et la multiplicité des objectifs poursuivis. En effet, ils ne se limitent pas à un seul aspect ; ils s'entrelacent et se complètent, ce qui reflète la complexité du sujet traité. Cette diversité d'objectifs témoigne de la richesse et de la profondeur de la problématique abordée et permet d'en appréhender les multiples dimensions avec rigueur. Nous analyserons ainsi la manière dont ces différentes visées s'articulent pour étayer et orienter précisément notre réflexion. Dans la perspective de mieux comprendre comment Facebook, en tant que plateforme sociale, modifie les pratiques langagières des étudiants francophones, nous cherchons d'abord à analyser les caractéristiques linguistiques propres à la communication étudiante en français sur Facebook, en soulignant l'influence des contraintes techniques de la plateforme sur les formes d'expression utilisées. Ensuite, nous examinons les besoins expressifs des étudiants dans leurs échanges et leur incidence sur les choix linguistiques. Enfin, nous nous attachons à identifier et décrire les innovations créatives en matière d'expression développées dans ce contexte. Ces objectifs permettent chacun d'éclairer un aspect spécifique de cette communication, en lien avec les contraintes, les besoins et les formes d'innovation évoqués.

Notre travail s'organisera en deux parties distinctes mais nettement complémentaires. Le cadre conceptuel s'appuiera sur plusieurs axes permettant d'analyser les pratiques langagières des étudiants en contexte numérique. Il pourrait s'articuler autour des axes suivants : l'usage de Facebook dans le milieu estudiantin, les fonctions sociales et communicationnelles de cette plateforme, ainsi que les spécificités des interactions numériques. En résumé, notre cadre conceptuel articulera des concepts issus de la linguistique numérique, de la pragmatique, de la sociolinguistique, et des sciences de la communication, afin d'explorer comment les étudiants utilisent le français sur Facebook dans des formes brèves, expressives et créatives. Sur le plan méthodologique, un dispositif pertinent sera mis en œuvre pour répondre aux objectifs de la recherche : en effet, l'investigation repose sur un questionnaire adressé à un public d'étudiants afin de mieux cerner les stratégies mises en œuvre dans leurs échanges numériques sur Facebook.

Enfin, une conclusion générale viendra dresser un bilan des résultats obtenus et apprécier leur portée au regard des hypothèses formulées. En effet, la mise en relation des résultats avec les objectifs de notre travail nous donnera l'opportunité non seulement de dégager de nouvelles interrogations et soulever des problématiques inédites, mais aussi ouvrir des perspectives et tracer des chemins novateurs pour la recherche, élargissant ainsi le champ des investigations futures.

2. Cadre conceptuel

Dès sa création, Facebook s'est présenté comme un espace dédié à la socialisation en ligne. Toutefois, il a rapidement dépassé la fonction initiale de mise en relation personnelle pour devenir un outil polyvalent. À l'origine conçu comme un réseau social électronique visant principalement à connecter les individus, Facebook a considérablement évolué pour offrir aujourd'hui une gamme étendue de services intégrés ou liés à sa plateforme. *« Facebook n'est pas dédié à une utilisation particulière, chacun l'utilise dans le cadre d'objectifs variés allant du jeu à la plate-forme de travail professionnelle »* (Barbe & Delcroix, 2008, p : 119). Ainsi, il ne se réduit plus à un simple outil de communication. Le fait qu'il n'a pas une fonction unique ou strictement définie en fait une plate-forme multifonctionnelle, capable de répondre à des besoins très divers selon les utilisateurs et constitue désormais un véritable écosystème complexe, ayant des dimensions ludiques, sociales, politiques et économiques.

L'une des caractéristiques fondamentales des grandes plateformes numériques, notamment Facebook, réside dans leur plasticité, qui se manifeste par la multiplicité de leurs fonctions. Ainsi, nous nous pencherons sur les différentes fonctionnalités de Facebook en tant que plateforme de communication, d'information et de divertissement, en mettant en exergue la façon dont ces trois dimensions s'articulent et se renforcent mutuellement dans les usages numériques.

2.1. La communication étudiante en contexte numérique

Parmi les réseaux sociaux qui grouillent sur la toile, les étudiants privilégient souvent Facebook pour sa simplicité, sa rapidité et son efficacité. Ses fonctions variées en matière de communication et d'accès à l'information facilitent le travail collaboratif, réduisent les distances et font gagner du temps. Outil central du quotidien, il leur permet de rester en contact, de publier du contenu, mais aussi d'échanger sur les cours, d'interagir sur les messages des autres, de créer des groupes de travail et de s'entraider. Selon Jenkins : *« Les nouveaux médias sont participatifs, interactifs et convergents : les utilisateurs ne se contentent plus de consommer l'information, ils la produisent, la*

commentent, la diffusent. » (Jenkins, 2013, p : 79). Cette dynamique s'observe chez les étudiants qui, à travers ces interactions régulières, développent simultanément leurs compétences linguistiques et sociales. Ainsi, si Facebook s'impose d'abord comme un espace privilégié pour la communication et la collaboration entre étudiants, il dépasse rapidement ce simple cadre utilitaire. Plus qu'un outil fonctionnel, il devient un véritable terrain d'expression personnelle et de créativité, où échanges brefs mais efficaces permettent de tisser des liens sociaux tout en stimulant le développement linguistique et les compétences sociales. Cardon, en soulignant que *: « Le temps des réseaux sociaux est un temps de l'instantané, du flux, du direct. Il impose une logique de réactivité permanente »* (Cardon, 2010, p : 55), met en évidence l'un des traits fondamentaux de l'environnement numérique contemporain : la temporalité propre aux réseaux sociaux. Contrairement aux médias traditionnels, les réseaux sociaux valorisent la rapidité, l'instantanéité et la mise à jour constante. Par ailleurs, il apparait que les réseaux sociaux modifient notre rapport au temps, en incitant à une réaction immédiate : il faut répondre vite, publier sans attendre, commenter dans l'instant. Si cette dynamique favorise la spontanéité et l'interaction, elle instaure également une pression continue sur les étudiants qui se voient contraints d'adopter certaines stratégies langagières et communicationnelles adaptées à ce rythme : privilégier la brièveté pour capter l'attention rapidement, recourir à l'expressivité pour se démarquer dans le flot d'informations, et mobiliser une créativité linguistique afin de produire des messages attractifs et mémorables.

Pour Balagué & Fayon : *« s'inscrire sur un réseau social peut répondre au besoin d'appartenance d'un individu à une communauté qui partage ses intérêts, voire son langage, avec laquelle il a des affinités »* (Balagué & Fayon, 2010, p : 36). Leur analyse révèle que les étudiants se tournent vers Facebook pour intégrer des groupes en phase avec leurs intérêts, leurs codes et leur langage. Au-delà du simple maintien des liens sociaux, ils y trouvent un espace où leurs affinités culturelles, linguistiques ou académiques sont reconnues. La plateforme favorise l'émergence de modes de communication spécifiques (abréviations, références communes, humour codé) qui consolident ce sentiment d'appartenance. Ces échanges contribuent à façonner des identités numériques ainsi qu'une langue hybride, entre oral et écrit. Ainsi, l'engagement dans ces communautés dépasse la connexion sociale : il participe à l'élaboration d'une culture jeune et numérique distincte.

3. Cadre méthodologique

3.1. Contexte de l'étude et public cible

Dans le contexte de l'étude *« La communication étudiante en français sur Facebook : entre brièveté, expressivité et créativité linguistique »*, l'enquête se déroule à une époque marquée par l'omniprésence des réseaux sociaux dans la vie étudiante. Facebook demeure une plateforme de choix pour les étudiants de français souhaitant échanger, s'informer et se socialiser. Dans cet environnement numérique, les échanges écrits se caractérisent souvent par leur concision (brièveté), une grande expressivité manifestée à travers des émojis, des images ou une ponctuation singulière, ainsi qu'une créativité linguistique (emploi de néologismes, jeux de mots, variantes orthographiques, mélange de registres, etc.) qui reflète l'agilité de la jeunesse à s'approprier les codes du numérique.

Le public cible de cette enquête est constitué d'étudiants en français, principalement inscrits dans l'enseignement supérieur, âgés de 20 à 25 ans, utilisant activement Facebook pour des communications personnelles ou académiques. Ce groupe comprend 50 étudiants inscrits en 3ème année licence au département de français à l'université Larbi Ben M'hidi en contexte universitaire francophone. L'enquête vise ainsi à explorer la façon dont ces étudiants adaptent la langue française aux contraintes et possibilités du médium numérique.

3.2. Présentation du protocole d'enquête

Afin de répondre de manière rigoureuse et systématique aux questions de recherche formulées, il est essentiel de définir clairement le protocole d'enquête déployé. Ce protocole décrit les étapes méthodologiques et les outils choisis pour la collecte et l'analyse des données, qui garantissent ainsi la cohérence, la validité et la fiabilité des résultats obtenus. Il s'appuie principalement sur un questionnaire ciblé, qui permettra une compréhension approfondie des stratégies de communication numérique adoptées par les étudiants sur Facebook.

Pour garantir la cohérence de l'échantillon, nous avons adressé un questionnaire (en ligne et en présentiel) à 50 étudiants ayant le même profil. Le questionnaire est, par définition, un instrument quantitatif, mais il peut aussi intégrer des questions ouvertes (approche mixte). Il a pour objectif de collecter auprès des étudiants concernés par l'analyse du corpus des informations sur leurs pratiques et stratégies communicationnelles sur Facebook. Ce questionnaire se compose de questions fermées (QCM, échelles de Likert) pour quantifier les pratiques, opinions et ressentis mais aussi de questions ouvertes pour permettre une expression détaillée et recueillir des exemples ou des explications.

3.3. Présentation et analyse des résultats

Cette partie expose de manière synthétique les données issues de l'analyse du questionnaire. L'analyse vise à mettre en évidence les principales tendances et à interpréter les stratégies de communication des étudiants sur Facebook, afin de répondre clairement aux objectifs de la recherche.

Par le biais d'un questionnaire que nous avons conçu à l'intention des étudiants de 3ème année licence, cette étude vise à recueillir des données quantitatives et qualitatives permettant de cerner les pratiques communicationnelles des étudiants dans un environnement numérique. Pour des raisons méthodologiques, le questionnaire que nous avons conçu et les questions formulées (09 questions) portent exclusivement sur les trois dimensions essentielles de notre sujet : la brièveté, l'expressivité et la créativité linguistique. Ainsi, nous avons délibérément évité d'aborder des questions générales concernant le profil des utilisateurs ou leur usage global de Facebook, afin de garder nos interrogations ciblées et strictement orientées vers ces trois axes spécifiques.

- **Question N°01** : *Principalement, vous utilisez Facebook pour : (plusieurs réponses possibles)*

Les résultats obtenus à cette question révèlent des tendances significatives quant à l'usage que font les étudiants de la plateforme Facebook. On note, tout d'abord, une prédominance marquée des dimensions interactives et collaboratives. Les résultats montrent que Facebook est principalement utilisé par les étudiants pour communiquer avec des amis (85%), partager du contenu (90%) et participer à des groupes d'étudiants (90%). L'utilisation pour suivre l'actualité ou des pages d'intérêt est pratiquement inexistante (10%). Cela indique que la plateforme remplit avant tout des fonctions sociales et collaboratives, au détriment de ses dimensions informationnelles. Ce qui illustre la plasticité des usages de la plateforme selon les besoins sociaux et contextuels des usagers.

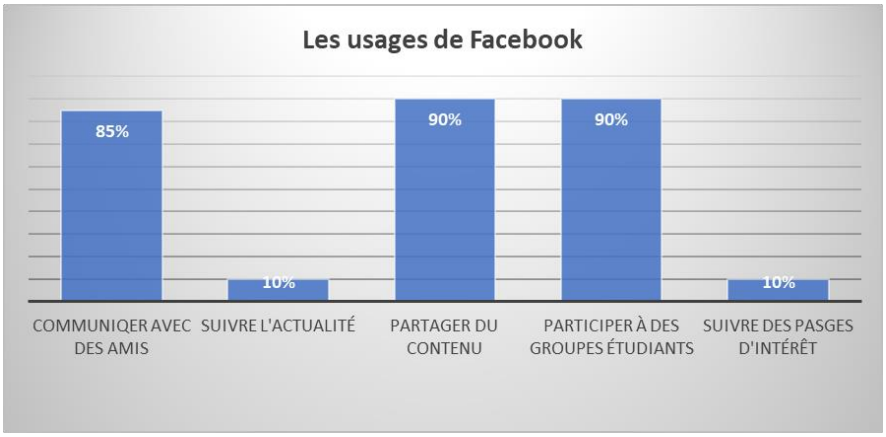

Figure N°01

- **Question N°02** : *En moyenne, vos publications/commentaires sur Facebook contiennent :*

[ ] 1-10 mots [ ] 11-30 mots [ ] 31-50 mots [ ] Plus de 50 mots

L'analyse des résultats concernant la longueur moyenne des publications ou commentaires sur Facebook par les étudiants révèle que la grande majorité des étudiants (44 sur 50, soit 88%) publie ou commente en utilisant entre 1 et 10 mots. Cela indique une forte tendance à privilégier des messages très brefs et probablement concis. Seuls 06 étudiants (12%) utilisent entre 11 et 30 mots, tandis qu'aucun étudiant n'atteint ou dépasse 31 mots dans ses publications ou commentaires. Cela suggère que les formats plus développés ou argumentés sont très peu utilisés sur cette plateforme dans ce groupe. Ce phénomène peut refléter l'usage très rapide et souvent spontané de Facebook, où l'attention est limitée et les échanges sont plus informels. Cela peut également témoigner de pratiques communicationnelles actuelles qui privilégient la brièveté, l'impact rapide et la simplicité du message. L'absence de publications plus longues ne signifie pas nécessairement un manque d'expression ou de profondeur, mais peut indiquer que Facebook est davantage perçu comme un espace de communication synthétique.

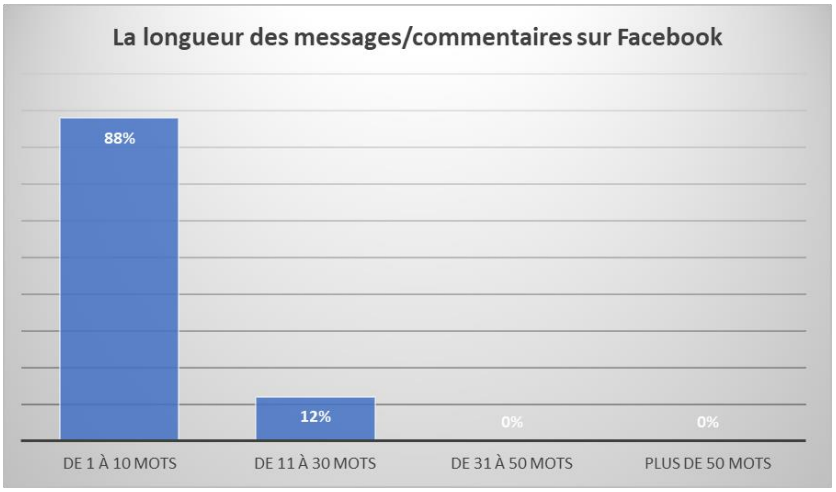

Figure N°02

- **Question N°03** : *Utilisez-vous des abréviations dans vos communications Facebook ?*

[ ] Très souvent [ ] Souvent [ ] Parfois [ ] Rarement [ ] Jamais

Les résultats montrent que l'utilisation des abréviations dans les communications sur Facebook est extrêmement fréquente parmi les étudiants. En effet, 42 sur 50 (84%) déclarent les utiliser très souvent, tandis que 5 étudiants (10%) les utilisent souvent, et seulement 3 (6%) disent les employer parfois. Aucun étudiant ne rapporte une utilisation rare ou nulle des abréviations. Cette tendance souligne l'importance des abréviations comme outil privilégié pour gagner du temps et économiser des caractères dans des échanges généralement rapides et informels. Elle illustre également une adaptation aux contraintes et aux codes spécifiques de la communication en ligne, où la rapidité, la simplicité et la fluidité du message priment.

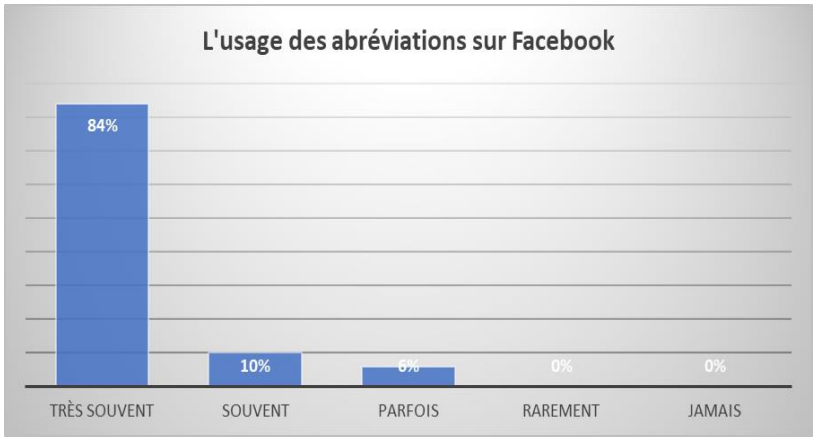

Figure N°03

- *Si oui, quelles abréviations utilisez-vous le plus ? (donnez 3-5 exemples) :*

Oui, les étudiants utilisent fréquemment des abréviations dans leurs messages et discussions sur Facebook. Certaines abréviations sont communes à tous les étudiants, comme « slt, bjr, bsr, bn8, cv, tkt, nrc, » .Ces raccourcis facilitent et accélèrent la communication car ils sont largement compris. En revanche, les étudiants développent des abréviations plus personnelles. (grv) (tfq) (doc pour document). Ces abréviations individuelles les aident à gagner du temps tout en restant clair et intelligible. Ainsi, il y a toujours un équilibre entre abréviations partagées par tous les étudiants et celles plus personnalisées qui répondent à des besoins spécifiques.

- **Question N°04** : *Selon vous, la brièveté sur Facebook est due à : (plusieurs réponses possibles)*

L'analyse des réponses des étudiants à la question de la brièveté des messages sur Facebook montre que la majorité (43 sur 50) associe cette concision à la nécessité de communiquer rapidement et au manque de temps. Par ailleurs, un nombre significatif (40 sur 50) évoque l'influence des habitudes développées sur les réseaux sociaux. Ces résultats soulignent que, sur Facebook, la brièveté est perçue avant tout comme un moyen de communication efficace, adapté à un contexte où l'attention est fragmentée et la réactivité valorisée. L'usage fréquent des réseaux sociaux renforce cette tendance en favorisant un style de communication direct, rapide et accessible, dans lequel les messages courts suscitent davantage d'engagement. Bien que mentionnée par seulement un étudiant sur cinq, la lisibilité pour le lecteur est également reconnue comme un avantage, mais reste un facteur secondaire. En revanche, l'influence d'autres langues, comme l'anglais, est jugée négligeable. En somme, la brièveté des messages sur Facebook s'explique principalement par les pratiques numériques et la pression temporelle, en lien avec les usages et les comportements spécifiques aux environnements des réseaux sociaux.

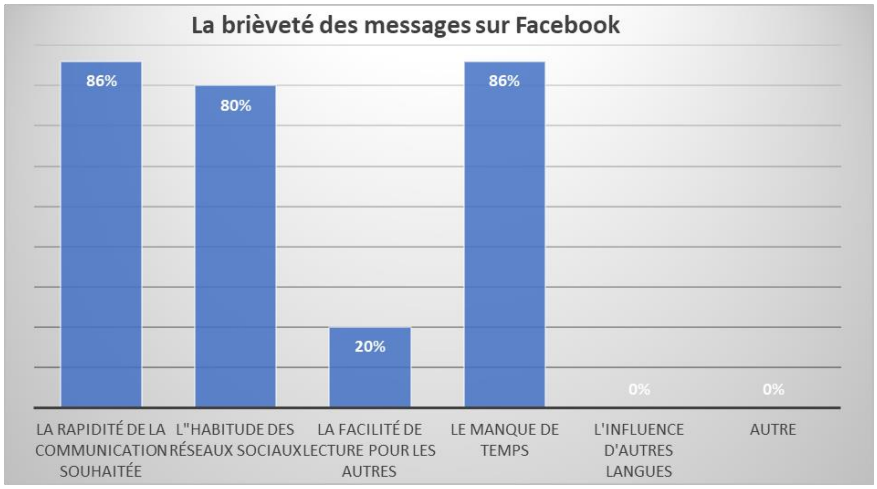

Figure N°04

- **Question N°05** : *Quels éléments employez-vous pour rendre vos messages sur Facebook plus expressifs ?*

Les réponses étaient très variées, ce qui montre l'intérêt d'une question ouverte. En laissant chacun s'exprimer librement, ce genre de question permet de recueillir de nombreux points de vue et expériences différents. Les résultats montrent que les étudiants utilisent majoritairement plusieurs éléments pour rendre leurs messages sur Facebook plus expressifs. Les émoticônes/emojis sont employés par 96% des étudiants, ce qui souligne leur rôle essentiel pour transmettre des émotions visuelles. De même, 88% des étudiants utilisent des points d'exclamation ou d'interrogation multiples, démontrant l'importance de la ponctuation répétée pour intensifier le ton ou l'émotion du message. Les majuscules sont également utilisées par 80% d'entre eux, et servent à simuler une expression forte ou un « cri » écrit. Enfin, la répétition de lettres, pratiquée par 84% des étudiants, permet de moduler la prononciation virtuelle des mots et d'accentuer l'enthousiasme ou l'approbation (ex : Ouiiiiiiii, Nooooon, Siiiiiii, Bravoooo). Ces résultats illustrent la tendance des jeunes à combiner différents procédés graphiques pour compenser l'absence d'indices non verbaux et enrichir la communication écrite sur les réseaux sociaux.

Exemples

Etudiant 05 : j'utilise principalement les emojis, 😀😊qui ajoutent de l'émotion 🥹😍et nuancent le ton du message 👍😜😡.

Etudiant 14 : J'intègre aussi parfois des GIFs, des stickers ou des images pour renforcer l'impact visuel du texte et transmettre plus clairement mes sentiments.

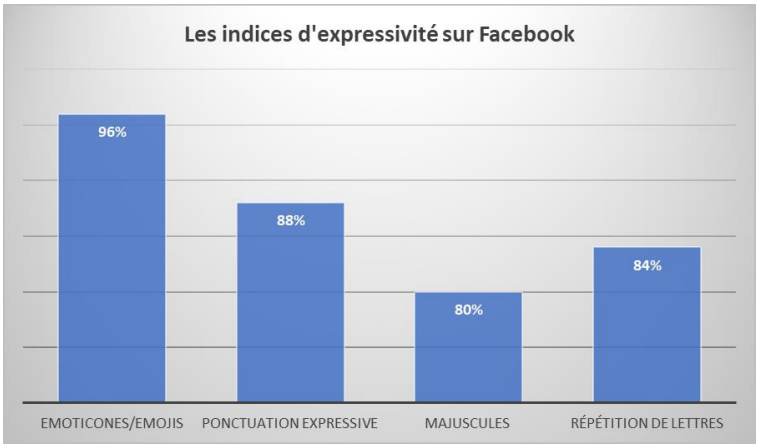

Figure N°05

Etudiant 23 : Les effets de texte (comme les confettis ou les cœurs dans Messenger) permettent également d'animer les messages et de les rendre plus vivants.

- **Question N°06** : *Les émoticônes/emojis vous permettent principalement de : (plusieurs réponses possibles)*

Les résultats à cette question montrent que les émoticônes ou emojis jouent avant tout un rôle dans l'expression et la clarification des émotions lors de la communication écrite. En effet, 90% des répondants estiment qu'ils permettent principalement d'exprimer des émotions, et autant considèrent qu'ils rendent le message plus sympathique. Par ailleurs, 86% soulignent leur utilité pour clarifier le ton, ce qui met en évidence la nécessité d'accompagner le texte de signes visuels pour éviter les malentendus. Remplacer des mots est aussi une utilisation répandue (84%), ce qui suggère que les emojis sont également perçus comme une forme condensée et expressive du langage écrit. En revanche, très peu (20%) les utilisent pour gagner de l'espace, ce qui reste marginal par rapport aux autres fonctions. Ces résultats traduisent donc une forte valorisation des emojis comme outils de nuance, d'expressivité et de convivialité dans l'échange numérique.

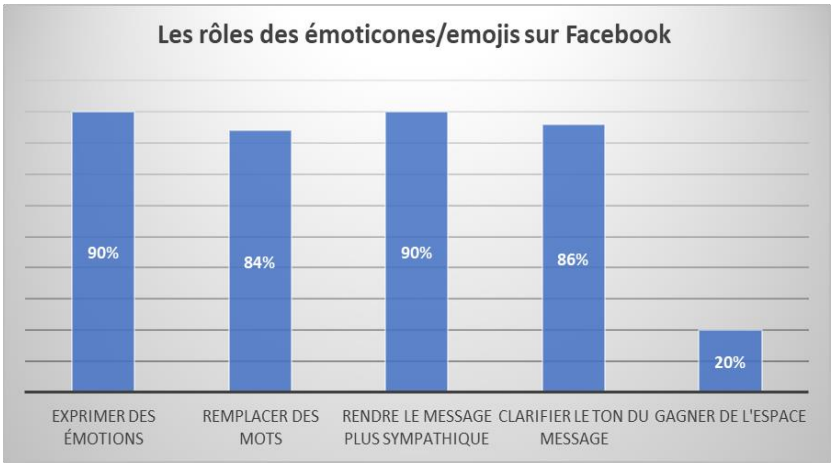

Figure N°06

- **Question N°07** : *Créez-vous parfois de nouveaux mots ou expressions sur Facebook ?*

[ ] Très souvent [ ] Souvent [ ] Parfois [ ] Rarement [ ] Jamais

Les résultats montrent que les avis sont partagés quant à la fréquence de création de nouveaux mots, aucune pratique ne fait l'unanimité parmi les 50 étudiants interrogés. Une partie des répondants (25 étudiants, soit 50%) adoptent une approche occasionnelle à rare de cette créativité linguistique, avec 13 étudiants déclarant le faire "parfois" et 12 "rarement". Une minorité significative (17 étudiants, soit 34%) manifeste une tendance plus active à

l'innovation lexicale, qui se répartit entre ceux qui créent "très souvent" (7 étudiants) et "souvent" (10 étudiants) de nouveaux termes. À l'opposé, seulement 8 étudiants (16%) affirment ne jamais s'engager dans cette pratique créative. Ces données démontrent que la plateforme Facebook stimule effectivement la créativité linguistique chez une grande majorité des étudiants (84%), même si l'intensité de cette créativité varie considérablement, et reflète probablement les différences individuelles en matière d'expression créative et d'engagement sur les réseaux sociaux. Pour illustrer cette créativité étudiante, les contraintes méthodologiques nous amènent à sélectionner quelques exemples représentatifs plutôt qu'une liste exhaustive : **Etudiant 03 :** boubouler (rigoler beaucoup), **Etudiant 07 :** Facebookeuse, likeur, postage, **Etudiant 16 :** chocolover, selfiteur, noctiréviseur, **Etudiant 22 :** Jamo jamaiqua, scrollage, batolusse, **Etudiant 29 :** snapouk, révisthon, **Etudiant 35 :** Madridiste, snapper, **Etudiant 38 :** tiktoker, instagramer, **Etudiant 44** : Notif, com.

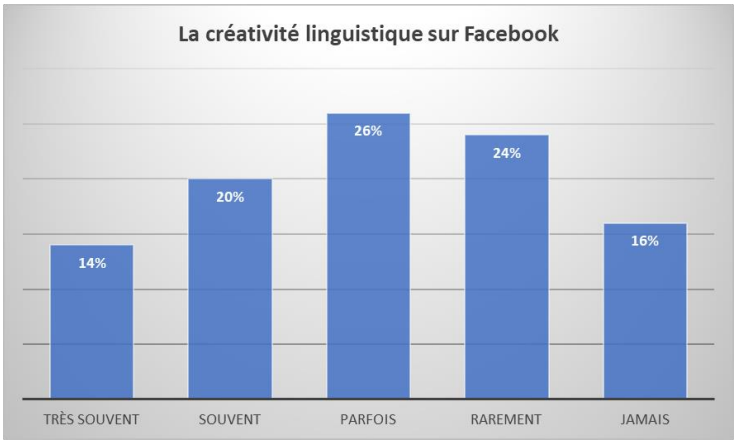

Figure N° 07

- **Question N°08** : *Mélangez-vous le français avec d'autres langues dans vos communications Facebook ?*

Les résultats révèlent que tous les étudiants interrogés combinent le français avec d'autres langues dans leurs échanges sur Facebook : 90 % le font régulièrement, 10 % de manière occasionnelle. Aucun ne déclare utiliser exclusivement le français, ce qui confirme l'omniprésence du multilinguisme sur cette plateforme. Les langues les plus fréquemment associées au français sont l'arabe et l'anglais, ce qui illustre une réalité linguistique marquée par la coexistence et l'interaction de ces idiomes dans les communications quotidiennes. Ce recours à plusieurs langues s'explique par la diversité culturelle des étudiants, l'influence internationale de l'anglais et la dimension identitaire et sociale de l'arabe. L'alternance codique, ou code-switching, apparaît ainsi comme une pratique spontanée et un moyen d'adaptation aux différents contextes et interlocuteurs rencontrés sur les réseaux sociaux.

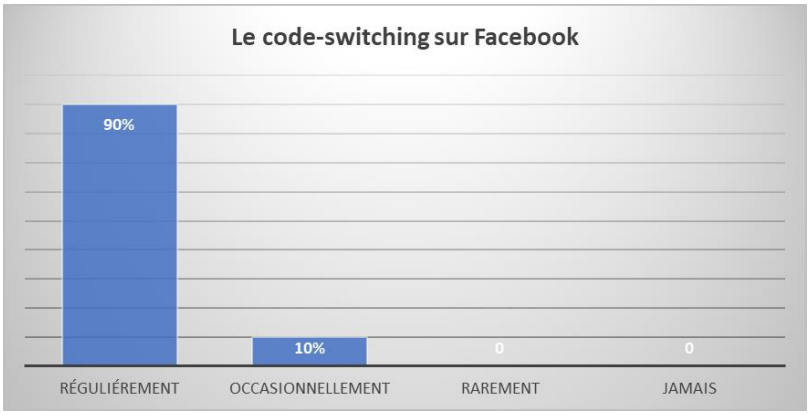

Figure N°08

- **Question N°09** : *En fonction de quoi (de qui) adaptez-vous votre style d'écriture sur Facebook ?*

Etant une question ouverte, elle suscite une grande diversité de réponses. Cette variété souligne l'importance d'une analyse qualitative approfondie pour saisir les nuances des stratégies d'adaptation du style d'écriture sur Facebook. Les étudiants adaptent leur style d'écriture sur Facebook en fonction de plusieurs facteurs. Tout d'abord, ils tiennent compte de la personne à qui ils s'adressent, qu'il s'agisse d'amis, de famille, d'enseignants ou de collègues, ce qui influence le niveau de formalité et le choix du langage. Le sujet de la discussion joue également un rôle important, car il permet de distinguer les échanges personnels des communications plus académiques ou professionnelles. Par ailleurs, l'importance du message, ainsi que le groupe ou la page où la publication est faite, modulent cette adaptation. Les relations de proximité avec le destinataire, la langue utilisée (français, arabe, anglais ou un mélange), ainsi que le contexte culturel ou les habitudes du public visé, sont aussi déterminants. Enfin, les conditions d'écriture, comme l'heure, le dispositif employé, ou la nécessité d'utiliser emojis ou abréviations, viennent compléter cette variété d'adaptations, et montrent une flexibilité langagière en fonction des interlocuteurs, des situations et des objectifs communicationnels.

4. Discussion et interprétation des résultats

Au terme de l'analyse des résultats issus du questionnaire adressé aux étudiants, nous pouvons dresser le bilan suivant :

Les étudiants de français déploient une panoplie de techniques pour maximiser l'efficacité communicationnelle de leurs messages courts. - *L'abréviation* constitue la stratégie la plus répandue. En fait, Les abréviations ne se limitent pas aux mots simples "tjrs" pour "toujours", "qd" pour "quand" mais s'étendent aux expressions complexes "tlm" pour "tout le monde", "stp" pour "s'il te plaît", "rdv" pour "rendez-vous"‟, "tfq" pour "tu fais quoi ?"‟. Ces contractions ne relèvent pas uniquement de la nonchalance linguistique mais elles créent un lexique spécialisé reconnu par la communauté étudiante témoignant d'une véritable économie scripturale. - *La troncation* représente une autre modalité de condensation : "prof" pour "professeur", "notif" pour "notification", "com" pour "commentaire". Ces formes raccourcies créent une certaine complicité et marquent l'appartenance à la communauté étudiante. - *L'ellipse syntaxique* permet également de réduire la longueur des énoncés tout en préservant leur intelligibilité. Les articles, pronoms et auxiliaires sont fréquemment omis : "Cours annulé demain" plutôt que "Le cours est annulé demain".

Paradoxalement, la contrainte de brièveté intensifie le besoin d'expressivité chez les étudiants. Face à la réduction de l'espace textuel, ils développent des stratégies de compensation émotionnelle pour préserver la dimension affective de leur communication et développent des modes d'expression multimodales afin de pallier l'absence de gestuelle et d'intonation. Les *emojis* constituent l'outil privilégié de cette compensation (96% des étudiants y ayant recours quotidiennement pour apporter une clarification du ton émotionnel). En effet, les réseaux sociaux, et notamment Facebook, ont joué un rôle majeur dans la démocratisation des emojis, qui sont aujourd'hui essentiels aux échanges numériques. Un simple cœur rouge ❤️, un sourire 😀ou un animal stylisé par un emoji 🐼, suffisent désormais à transmettre des émotions que les mots seuls peinent parfois à communiquer. *« Le « E » signifie image (絵), et « moji » signifie caractère (文字). Originaire du Japon, les emojis donnent vie aux conversations à travers des expressions faciales, des gestes et des objets »* (Berger, 2025). Ils permettent de condenser des états émotionnels complexes en signes visuels immédiatement décodables. Un simple 😁peut exprimer l'amusement, l'ironie ou la complicité selon le contexte. Cette iconographie émotionnelle enrichit considérablement le potentiel expressif des messages courts.

S'ajoutent à cela les répétitions graphiques, comme la multiplication de lettres dans certains mots "cooool", "ouiiiiii", "nonnnn" ; "siiiiiiii" ; "troooop bien", qui servent à intensifier l'expression. La *ponctuation expressive* usant de signes non conventionnels comme la multiplication des points d'exclamation « !!!!!!!!! », d'interrogation « ??????? » ou l'usage des points de suspension (...), permettent de moduler l'intensité émotionnelle des énoncés. Cette intensité graphique permet de recréer une certaine proximité communicationnelle, en dépit de la distance imposée par l'écrit.

L'analyse révèle une créativité linguistique adaptative chez les étudiants, qui ne se limite pas à une simple réponse aux contraintes techniques, mais s'inscrit dans une dynamique innovante et identitaire. Elle se manifeste d'abord dans la concision. Les restrictions de longueur imposées sur les réseaux sociaux, et en particulier sur Facebook, ont favorisé cette innovation langagière. Pour contourner ces contraintes, les étudiants ont mis au point diverses formes contractées et acronymes afin d'optimiser leur communication (cette économie scripturale génère 73% des innovations observées dans le corpus). Par ailleurs, elle se traduit par l'invention de néologismes contextuels, des termes créés pour répondre aux exigences immédiates des situations de communication numérique.

De plus, le métissage linguistique, à travers l'alternance codique entre le français, l'arabe et l'anglais, s'impose comme une stratégie permettant d'ajuster le discours aux interlocuteurs et aux contextes. Enfin, les jeux graphophonétiques, tels que l'utilisation d'écritures phonétiques intentionnelles (« kel » pour « quel », « mwa » pour « moi »), reflètent une volonté de simplifier et de personnaliser l'expression écrite. L'ensemble de ces pratiques ne vise pas uniquement l'efficacité communicationnelle ; il participe aussi à l'affirmation d'une identité linguistique propre à la jeune génération étudiante, marquant ainsi leur appartenance à une communauté aux codes spécifiques.

Tout compte fait, on peut dire que l'étude révèle une dynamique complexe dans la manière dont les étudiants communiquent sur Facebook. Ils naviguent constamment entre trois pôles et sont en permanence obligés de composer avec plusieurs dimensions indissociables. D'un côté, ils se confrontent aux contraintes techniques propres à la plateforme, telles que la limitation du nombre de caractères, la structure des interfaces ou la présence / absence de certaines fonctionnalités, ce qui restreint la liberté d'expression et oblige à réguler la forme des messages. Parallèlement, ces étudiants cherchent à satisfaire des besoins expressifs personnels : ils veulent transmettre leurs émotions, nuancer leurs propos ou encore affirmer leur identité, ce qui les pousse à trouver des moyens originaux de contourner les limites imposées, afin que le message reste fidèle à leur intention. C'est précisément dans cet espace de tension que naissent des innovations créatives : pour surmonter les obstacles techniques tout en exprimant leur individualité, les étudiants inventent des néologismes, détournent le sens de certains mots, jouent avec le langage et construisent de nouveaux codes d'écriture. De cette manière, l'alternance constante entre contraintes, besoins expressifs et créativité linguistique façonne des modes de communication originaux et contribue à élaborer des pratiques communicatives particulières, caractéristiques de la communauté étudiante.

Conclusion

La communication étudiante en français sur Facebook se caractérise par une dynamique d'influence réciproque entre brièveté, expressivité et créativité linguistique. Les contraintes de rapidité et d'espace favorisent le recours à l'abréviation et aux messages courts, ce qui impose une certaine brièveté dans les échanges. Cependant, les étudiants cherchent aussi à exprimer leurs émotions, leurs intentions et leur personnalité, ce qui stimule l'inventivité dans le choix des mots, l'usage d'émoticônes, ou la création de tournures originales. Cette dynamique constante entre l'efficacité de la communication et le besoin de se démarquer conduit à l'émergence de formes langagières hybrides et innovantes, où chaque dimension influence et transforme les autres, enrichissant ainsi l'expression écrite sur le réseau social.

L'analyse de la communication étudiante en français sur Facebook révèle un phénomène linguistique complexe où contraintes techniques, besoins expressifs et créativité communicationnelle s'articulent de manière dialectique. La brièveté, initialement perçue comme une contrainte, stimule l'innovation linguistique plutôt qu'elle ne l'entrave. Les étudiants développent un "squelette consonantique" en supprimant systématiquement toutes les voyelles (slt, bjr, tkt, nvl, mrc) donnant ainsi lieu à la naissance de nouvelles formes expressives. L'expressivité trouve de nouveaux canaux de manifestation qui compensent les contraintes du medium. La créativité linguistique émerge comme une réponse adaptative aux défis de la communication numérique. Loin de représenter une détérioration de la langue française, ces pratiques témoignent au contraire d'une vitalité linguistique manifeste ainsi que d'une capacité affirmée à s'adapter aux nouveaux environnements communicationnels.

À la lumière de l'analyse des pratiques communicationnelles étudiantes sur Facebook, marquées par une dynamique d'interaction entre brièveté, expressivité et créativité linguistique, nous pouvons conclure que les résultats obtenus s'inscrivent pleinement dans la continuité des hypothèses formulées en amont de l'étude, et confirment de manière claire et cohérente ces dernières. Par ailleurs, la cohérence des résultats avec les hypothèses renforce la solidité méthodologique de la recherche, et offre une base fiable pour des investigations futures visant à approfondir la compréhension des phénomènes en question. Par exemple, il serait pertinent de se demander *dans quelle mesure ces pratiques communicationnelles sur Facebook influencent-elles les compétences rédactionnelles des étudiants dans un contexte académique ?* Cette perspective de recherche future pourrait contribuer à la compréhension des effets que ces formes hybrides et innovantes d'expression écrite, nées des contraintes et opportunités du numérique, ont sur l'évolution des compétences rédactionnelles des étudiants dans un contexte formel. Une telle étude permettrait de mieux saisir les interactions entre communication informelle et exigences académiques, contribuant ainsi à envisager des pratiques pédagogiques intégrant ces nouvelles réalités langagières.

Keywords Intervenant; commitment to safety; biologically processed product; biological damage.

Abstract
There are many applications resulting from scientific and technological progress in the field of industries and services, especially biologically processed and genetically modified products, so that these applications affect the life of the person who is considered the final consumer of these products. As these products are biologically treated they cause harm to the consumer in his environment and his skin directly, especially as these damages accumulate and appear only after a long period of acquisition and use of the product, making it difficult to treat their effects. So that it has become mandatory obligation to comply with the safety of consumers against the damage of products treated biologically.

Introduction:

Free market theories has always dominated the course of the global economy, and the accompanying passion of merchants for competition and its challenges, due to their excessive reliance on chemical, organic and biological compounds in many of their products, in order to raise production rates as quickly as possible, and at the lowest prices, even if that Causes harm to consumer safety. In addition to the information technology revolution witnessed by various industries, which prompted merchants and manufacturers to make use of its various data, especially genetic engineering, which played a major role in creating many genetic modifications in plants, fish and animals, on which many food industries are based, in order to raise the level of production, but unfortunately it carries with it many serious repercussions on the health of the consumer, and the matter becomes more complicated when it comes to medicines, medical and pharmaceutical preparations, and cosmetics , Because

of its strong impact on its preservation and suitability for use, and because of its risks that directly threaten the security and safety of the consumer, and because the manufacturer often uses chemicals in the manufacture of many of these preparations.

On the other hand, it has been discovered that many electronic devices play a serious role in threatening consumer safety, because they are made of toxic materials, which greatly harms not only the people living near the factories that produce these devices because they rely in their manufacture on lead and chromium, which is known to have a toxic effect, as well as copper and Others, but even users of these products. what has increased the seriousness of the matter is that many industries have recently resorted to relying on nuclear energy as a source of energy, not caring about the danger of radioactive leaks that contaminate products and goods and consequently lead to a disruption of the natural balance within the tissues and cells of the consumer.

All of this is a result of the liberalization of international trade due to economic globalization revealed the inability of many national legislations to protect some of their gains, especially in the field of consumer protection. This is what led to the call to unify legal rules in the field of consumer protection at the international level to ensure equal treatment between merchants in different countries. This idea has gained great importance, especially in the field of consumer protection from harm from biologically treated products, as most goods and services are not commonly traded on an international scale, then Unifying the rules in this field must be done by setting a minimum level of controls that must be observed in this field, provided that the details are left to the rule of national legislation, and this is the approach followed by the European Union in this regard.

Hence, we see the inevitability of preserving the health safety of the consumer of biological products, especially in the face of the biologically harmful activities of merchants and manufacturers, after it was proven that the Arab legal systems - including the Algerian legal system - are devoid of legislation sufficient to protect the consumer in this field, especially after the percentage of the incidence of cancer in its various forms in our society, which has recently recorded unusual rates, which forces us to consider the importance of organizing a commitment to consumer safety of biologically treated products.

Therefore, the research problem revolves around the absence of a clear legislative vision for the interventionist's commitment to consumer safety of biologically treated products, which has caused this situation to raise several questions, the most important of which are:

What is the content of the intervener's commitment to consumer safety of biologically treated products?

Our research will address this through two sections. The first relates to the basis of the interventionist's commitment to the consumer's safety from the biologically treated product, and the second section relates to the controls of the interventionist's commitment to the consumer's safety from the biologically treated product.

Chapter one: The basis of the interventionist's commitment to consumer safety from the biologically treated product

Biologically treated products are newly created products resulting from scientific and technological applications progress in the field of various industries, which prompted professionals and stakeholders to make use of technological revolution, especially genetic engineering, with the aim of raising the level of production due to the advantages offered by these biologically treated products in terms of abundant production and low costs to fulfilling consumers' desires. But on the other hand, these biologically treated products cause environmental damage that is difficult to remedy, in addition to their health damage that affects humans. The most dangerous thing is that these damages accumulate and do not appear until a period of time after their use. Hence, the recent damage resulting from biologically treated products has led to raising the problem of the basis of the intervenor's obligation to protect the consumer against this harm, and whether this obligation comes from the law or the contract.

Hence, we need to define the effect of the biologically treated product and explain its applications in commercial transactions, then address the source of the interventionist's commitment to the consumer's safety from the biological product.

The first requirement: The nature of the effect of the biological product and its applications in commercial transactions.

We will discuss the definition of the harmfulness of a biological product; highlight its characteristics, its reflection on the legal relationship between the intervener and the consumer, and its most important applications in commercial transactions.

The first section: Definition of the damage of the biological product and its characteristics:

1/ The concept of the damage of biologically treated products:

The effects resulting from biologically treated products are multiple and take a variety of forms, so we must search for the concept of this type of legally considered damage and determine its characteristics. However, what we noticed through our research is the lack of definitions that have been subjected to this damage, and this is due to the recent spread of damage to biological products. There are few legal studies that have dealt with regulating the responsibility for exposure to this damage in the relationship between the intervener and the consumer.

One of the most important definitions that address this damage is the text of Article 27 of the Biosafety Protocol as: "harm resulting from transboundary movements of living modified organisms," as defined by the US Environmental Protection Act CERCLA as: "damage that leads to the destruction of a natural resource."

What is noticed from these definitions is that they consider the damage resulting from biologically treated products to be a form of defect that afflicts the system of utilizing natural environmental resources, but they neglected that this damage has now affected humans as the final consumer of these goods and services, and therefore a distinction must be made between the biological damage that is caused To the environment in one of its elements, and the damage directly caused to humans, causing a defect in their vital functions.

Some commentators of civil law also went on to drop the general theory of damage on biological damage, considering that material damage is a violation of the interest of the effected person of financial value or harm or diminution of a right or material interest, and since the damage results in an infringement on human rights and capabilities, so that infringement causes an organic defect that results in the loss of those components or their complete loss, and may lead to harm the affected person's professional abilities. Hence, the material damage can be a serious harm to a person's health as a result of his eating food made from biologically processed or genetically modified products, which may cause allergies. Or taking the patient as a consumer of molecular therapy using genetic engineering may lead to transforming diseased cells into cancerous cells or disabling one of the genes that perform essential work for the human body.

It may also be included within the scope of the concept of damage resulting from a biological product, the moral damage resulting from a person eating genetically modified food, which leads to his contracting organic diseases and morphological deformities. Here, the harmful act may result in a moral damage.

2/The characteristics of the biologically treated product damage:

Biological damage is characterized by special features that distinguish it from other damages affecting the consumer, which have legal repercussions, which are as follows:

- **Difficulty in monitoring damage in biologically treated products:** Since biological damage is of a hidden nature, it is difficult for the consumer to notice and detect it when he eats the product or receives the service. This is due to the fact that biological materials are microscopic bacteria, viruses, or radiation that is difficult to see with the naked eye, It cannot be perceived by smell or touch, even if this product causes harm to humans, it is difficult to prove it if the consumer wants to impose responsibility on the intruder for the harm he has encountered.

- **The slow effects of damage from a biologically treated product:** The effects of biological damage may not appear immediately on the consumer, and this damage can also be transmitted to his heirs after him, and this is what makes the effect of this type of damage not limited to the present only, but may extend to future generations.
  As confirmed by the Carthage Protocol on Biosafety, the effects of biological damage cannot be observed except after long periods of time after eating the commodity or using the biologically treated product. This was explicitly confirmed by the French Court of Orleans in the "Monsanto Company" case when it held that biological damage would leave negative effects on biodiversity, the size and nature of which would be difficult to determine except over the coming years.
  On the one hand, this characteristic has raised several problems, regarding the extent to which the supplier's responsibility ends after the good or product crosses the borders of the country to which it is supplied, and on the other hand, the difficulty of proving the causal relationship between the intervening error and the damage that occurred, due to the passage of a long period of time between the occurrence of the accident and its discovery
- **Difficulty in determining who is responsible for the damage to a biologically treated product:** Biological damage is characterized by the difficulty of determining its source, and this is due to the multiplicity of those involved in the production of the commodity, as the products pass through several stages and through many people (producer - importer - distributor - wholesaler - retailer) until they reach the consumer, and this leads to difficulty identifying the person responsible, and thus raises several problems, the most important of which is the difficulty of proving this damage and the difficulty of identifying who is responsible.

The second section: Applications of the biologically treated product to commercial transactions:

Biotechnologies that are used in various industries are considered to be various types of cells and organisms (bacteria, viruses, fungi...), or complexly combined radioactive materials, which affect the consumer's health in general. But not all of these biotechnologies can be used industrially or have application in commercial transactions, and from here we will shed light on the most important technologies used in these fields:

1/ Genetically modified organisms (GMO): What has been observed recently is the increase in the process of introducing organisms with a specific genetic content to produce goods with improved characteristics in a new way. This method has received the lion's share in many industries, especially in the production of agricultural crops, seeds, and agricultural and food products.

2/ Mutations: They are a sudden and continuous change that occurs in the genetic makeup of an organism, leading to the emergence of a new, different generation.

3/ Tissue culture: It is the cultivation of any plant part in an environment that is artificially fed, sterile and free of pollution.

4/ Biotechnologies: They are methods of using living organisms in order to modify the manufacture of some goods to improve their quality or to produce goods bearing desirable characteristics, or vice versa, through genetic engineering.

5/ **Biological compounds:** These are the compounds that are usually used as preservatives, including:

ATIC compound: It is considered a food preservative, and it has been shown that it is abundant in common foods. It has been proven that this compound is considered a carcinogenic and toxic substance and causes a defect in the DNA strand, and inhaling it may cause cancerous tumors in the lung.

Olestra compound: It is a manufactured food additive consisting of sugar and fat. It was approved by the Food and Drug Administration in USA in 1996 as a food additive for use in snacks such as cornflakes. However, this compound should not be overused, and foods that contain this compound must carry adequate warnings indicating its negative effects, such as diarrhea, intestinal cramps, and withdrawal of vitamins from the body.

Mycoprotein compound (Quorn): It is a type of fungus that is used in the manufacture of protein-free meat. Although this compound is placed on the list of safe food compounds, it has been proven that its excessive use causes diarrhea, vomiting, and skin rashes, and may lead to death.

RF/MW radiation: It is considered one of the most common causes that lead to the consumer suffering from biological damage when exposed to this radiation, as a result of eating some foods or using some substances (preparations - medicine -...) due to the possibility of malfunctioning the functions of devices inside the body and causing cancer.

The second requirement: The source of the intervener's commitment to safety against the biologically treated product:

In Law 03/09 relating to consumer protection and suppression of fraud, the Algerian legislator mentioned that the rules of this law apply in the field of consumer protection, and to every good or service offered for consumption in return or for free and to every intervener in all stages of the process of offering for consumption. Through this law, the Algerian legislator, in its Article 3, Paragraph 06, defined product safety as: "The complete absence or presence, at acceptable levels and without danger, in a food substance of contaminants, adulterated substances, natural toxins, or any other substance that can make the product harmful to health in an acute or chronic manner." Then added in paragraph 11 of the same article that: "A sound, fair, and marketable product: a product free from any deficiency and/or hidden defect that guarantees no harm to the health and safety of the consumer and/or his material or moral interests."

We perceive from this text that the Algerian legislator recognized the application of the rules of this text in the field of consumer protection, and to every intervener in all stages of the process of producing and displaying goods for consumption, and thus expanded consumer protection, especially by defining the safety of products and those that are marketable by being free of any defect; Which may lead to it compromising the safety and health of the consumer, causing him material or moral harm. Therefore, we conclude from the text that the basis of the intervener's commitment to the consumer's safety is the law. It then follows that the contract between the intervener and the consumer stipulates this obligation or not, and this matter was confirmed when Article 19 stipulates in paragraphs 2 and 3 of Law 18/09 amending and supplementing Law 09/03 that: "withdrawal is the consumer's right to withdraw from the purchase of a product without just cause. The consumer has the right to refrain from purchasing a product within respect of the terms of the contract."

However, this law did not specify what is meant by a product that is safe and safe for the health of the consumer, and did not regulate the specifications that must be met to ensure that the biologically treated product is

free from biological harms, which may be understood as saying that the scope of the intervener's commitment to safety stops at the limits of traditional harms, Especially if the intervener maintains that the biological damage is not classified as among the conventional damages, whether in terms of the methods of its detection or in terms of the size and type of damages resulting from it, and therefore it is difficult here to say that the basis of the intervener's commitment to the safety of the consumer of the biologically treated product is the law**. Can we consider the basis of this obligation to be the contract?** However, in practice, this is difficult because the party involved does not accept the commitment to safety against biological damage under the contract because he always seeks to evade obligations that would burden him towards the consumer.

At the international level, European directives have imposed many obligations that the intervener must take into account in general regarding the safety of goods and products offered for consumption, foremost of which is what was stated in Article 1, Paragraph 3 of European Directive No.: 2001/95/EC that The producer is committed to putting only safe products on the market, and Paragraph 2 of it was keen to specify when a product is considered safe, which is if it meets the specifications and standards stipulated in Article 4 of the same directive. If they are not sufficient, then what matters is what is stated in the national law of the country in which the product is marketed.

What is noted from the texts of the European directive is that it addressed the intervener's commitment to safety in general, without addressing biological damage with a specific provision. This indicates a deficiency in these directives, as evidenced by the damage to which consumers in some European countries were exposed, In 2004, a safety test was conducted on 98 products offered in European markets (such as children's toys, lighters, laser pointers, involuntary reflectors, candles, etc.), and it was found that 25 of them contained biological harmful substances, and that 27 of them were susceptible to becoming a defective product.

The thing that increases the seriousness of the matter is pharmaceutical products, especially since the institutions responsible for producing a defective drug evade responsibility by claiming that there is no legal text obligating them to be safe against biological damage, and that they are not linked to the consumer (patient) by any direct contractual relationship, This often exposes the injured party to not meeting the conditions of the compensation claim. However, the French judiciary was keen to confront these challenges by establishing the principle of "safety precaution" in accordance with Article 1135 of the Napoleonic Code, which stipulates that contractual obligations are not interpreted in light of the letter of the texts or clauses of the contract, Rather, it is interpreted according to the implicit will of the contracting parties and what is required for proper implementation of the contract in light of prevailing customs. The Court of Cassation ruled in application of this in its ruling issued in 1998 that drug producers must ensure that they are free of defects that pose a danger to people or property. It is clear from this ruling that it is intended to establish a supposed legal obligation, obligating the intervener to take into account the consumer's safety against biological damage, regardless of the existence of a contractual relationship between him and the consumer.

In response to the above, it seems clear that the basis of the intervener's commitment to the safety of the consumer against the biologically treated product must be the law and not the contract, because there is no room in consumption contracts in particular to leave such an obligation to the will of the parties Because the intervener quickly repudiates and forces the consumer to accept the contract free of this obligation, and on the other hand, there are multiple interveners who contribute to the product reaching the hands of the final consumer, making it difficult to say that there is a direct contractual relationship between the consumer and them ,Therefore, it is difficult to rely on the contract to cover this obligation. In addition to the seriousness of biological damage, the general texts regulating the consumer safety obligation are not sufficient, and therefore we need special texts that address the precise details of this obligation.

Chapter two: Controls for the Interventionist's Commitment to Ensure Consumer Safety from the Biologically Treated Product

Since the obligation to be safe is the debtor's pledge to implement his obligation without harming the creditor, and in order to establish this obligation two conditions must be met. The first is that the relationship involves a danger that threatens one of the parties - and this is the justification for the existence of the obligation to be safe. The second - that the debtor of the obligation must be a professional - and this is what this obligation requires, that it requires from the debtor more care and diligence, and that he has high experience that enables him to exercise care and diligence that exceeds the care and diligence of the average person, Also, the term Biosafety refers to the procedures adopted to ensure the safe use of biotechnology applications, and the biological safety controls to protect the health and safety of the consumer, which requires the intervener to use food and environmental standards to ensure consumer safety, This is what we seek to achieve by presenting the most important controls for the interventionist's commitment to consumer safety of the biologically treated product.

From here, we will first address the interventionist's obligation to provide a biologically safe product, and then we will address the interventionist's obligation to inform the consumer of the nature of the effects resulting from biological materials.

The first requirement: The interventionist's commitment to provide a biologically safe product:

Biologically treated products are classified as inherently dangerous products, because the danger is inherent in them, and thus they differ from defective products to which the danger is inherent. Hence, we must separate between the safe product, even though it contains biological materials, and the biologically harmful product, Hence, we must first address the measures that the intervener must take into account in order to provide a sound biologically treated product, and the amount of care that the intervener must exercise in this aspect.

Section One: Measures that the intervener must take into account in order to provide a sound product:

The most important measures to ensure the provision of a safe biologically treated product are:

1/Ensuring the availability of standards that prove that the product is free from biological harm: These standards must be regulated by internal laws, and should not be left to contractual negotiations between the intervener and the consumer due to the possibility of the first party repudiating them.

The Algerian legislator stipulated in Article 4 of Law 09/03 relating to consumer protection and suppression of fraud that every intervener, when placing food for consumption, must respect the obligation of the safety of these materials, and ensure that they do not harm the health of the consumer. The concept of microorganisms (viruses, bacteria, yeasts, fungi...) was specified in Executive Decree 15/172, which specifies the conditions and methods applied in the field of microbiological characteristics of nutrients.

The concept of microorganisms (viruses, bacteria, yeasts, fungi...) was specified in Executive Decree 15/172 specifying the conditions and methods applied in the field of microbiological characteristics of nutrients. Then define the microbiological characteristics in Article 3, Paragraph 2, of the aforementioned Executive Decree and consider them to be the criteria to be applied to nutrients in order to ensure respect for the hygiene and safety of nutrients during their placement for consumption. and added in Paragraph 3 of the same article that microbiological standards are the standards that determine the extent of acceptability of a product, a portion of its nutrients, or a method on the basis of the absence or presence of microorganisms or the quantity of their toxins..., and consider The security standards for nutrients in Paragraph 4 of the same article to be the standards that determine the extent of acceptability of a product or share of nutrients applied to materials offered for sale. As stated in the text of Article 08 of Executive Decree 15/172 mentioned above, "The party involved in the process of placing nutrients for consumption must ensure respect for microbiological standards..."

The legislator added that these standards will be determined according to a decision of the ministers in charge of consumer protection and the suppression of fraud, agriculture, health... We note that the Algerian

legislator tried to give an understanding of the standards that determine the extent of the health and safety of the product offered to the consumer in order to prevent the emergence of any microbiological risk, and the scope of determining these standards is left to the ministers in charge of consumer protection, each according to his specialty and field.

At the international level, there are no unified standards regulating the rules for assessing the risks of biologically treated products or genetically modified organisms, despite cooperation between many international bodies to classify substances and compounds that affect consumer health and safety, such as the World Health Organization (WHO), the Food and Agriculture Organization (FAO), and the Carthage Protocol on Biosafety ,these systems did not set standards for evaluating biological harm, and instead defined a safe product in general, without specifying a distinct definition for a biologically safe product. Because according to the text of Article 6 of European Directive No. (1985/374/EC): A product is considered safe if it does not cause harm to the consumer according to his expectations: taking various circumstances into account, such as the way it is presented, its use in the expected manner, and the time in which it was put into circulation.

It is clear from the above that sufficient criteria have not been specifically determined to be considered biologically safe, because it is difficult to detect a biologically harmful product from the way it is presented or packaged, Given that biological organisms and compounds are impossible for the consumer to perceive with his normal senses, because these compounds and organisms are heavily involved in the composition of the product and improving its quality, shape and texture in a way that attracts the consumer to use it, in addition to the fact that the biologically treated product does not show its effects until after continuous use of the product or service.

2/ Comparing the advantages and disadvantages of using biological material in the product: Note that many industries rely heavily on biological materials, and therefore the goods containing a biological material or component is not considered harm in itself, However, the interventionist must compare the benefits and disadvantages of this biological substance from an economic and social perspective, and the seriousness of the potential risks of its use. For example, some medications that contain biological compounds are necessary to treat a serious disease such as cancer, but at the same time they have a side effect in other matters such as hair loss.

3/ We do not rely on the consumer's personal ability to evaluate the safety of the product: the interventionist must not rely in evaluating the biologically treated product on the consumer who owns that product, even if data regarding the components of the product are written and shown on its packaging (label),Because most consumers do not have the culture of paying attention to the label and reading the components of the product, and even if they did, the consumer often does not have the ability to understand the nature of these compounds or their effect, and therefore the intervener must take samples of the product and conduct laboratory tests on it Before offering it to the consumer, this is what was stipulated in Article 09 of Executive Decree 15/172 mentioned above, taking into account the methods of risk assessment by the competent international organizations according to Article 10 of the same decree.

Section two: The standard of care that the intervener must exercise to provide a biologically treated product that does not harm the consumer:

There are two standards to measure the care that an interventionist must exercise when he is in the process of implementing the standards required of him to provide a biologically treated product free from biological harm, which are the personal standard and the objective standard.

1/ Personal standard: According to this standard, in order for the intervention issued by an action to be considered a violation of taking the necessary standards to provide a biologically safe product, the person must personally know that he has performed an action or refrained from an action that entails a violation, and that practicing this action would harm the consumer. It is noted that adopting this personal criterion would narrow the scope of cases in which the merchant's behavior would be considered a mistake or a violation of the implementation of his

obligations, due to the difficulty of proving the presence of this knowledge on the part of the intervener, considering that the subject of proof is an intangible psychological issue.

2/ Objective standard: This standard is based on measuring the intervener's knowledge of the possibility of biological harm occurring when the consumer acquires the biologically treated product, in light of a fixed standard previously defined, which is the standard of the careful man or the careful intervener in the same circumstances and competence as the intervener, regardless of the interventionist's personal psychology. So, it is assumed that the intervener is aware of the possibility of biological damage occurring if the person is careful in the same circumstances and competence as him.

Many legislations, including Algerian legislation, in the process of defining a safe product, have sought to clarify the role of consumer expectations as one of the measures that must be taken into account when assessing the interventionist's commitment to safety. So the legislator stipulated in the text of Article 09 of Law 09/03 related to consumer protection and suppression of fraud that products intended for consumption must be guaranteed and have security in view of the legitimate use expected of them. With that it does not cause harm to the health, security or interests of the consumer, within the normal conditions of use..., and he added in Article 10 of the same law that every intervener must respect the obligation of the security of the product that he puts for consumption with regard to:

- Its features, composition, packaging, and conditions for assembly and maintenance - The effect of the product on other products when it is expected to be used with these products - The presentation of the product, its labeling, and possible instructions for its use and destruction, as well as all instructions or information issued by the product - Categories of consumers who are exposed to serious danger as a result of using the product, especially children.

At the level of judicial definitions, the French Court of Cassation defined a safe product as: "a product free of defects that pose a danger to people, according to the degree of care and care expected from the intervener."

In this regard, the French Court of Cassation adopted an expanded interpretation, which would open the horizon for the consumer to expect whatever he wants regarding the interventionist's commitment to safety, as it explicitly decided that: The product must provide the safety that is expected to be provided by it. However, for our part, we do not agree with this ruling, since it gives free rein to evaluating the consumer's expectations in his personal assessment of the safety of the product, but it is preferable for the evaluation to be made according to the objective standard, which is the standard of the average consumer or what the general public expects.

The second requirement: The legal nature of the intervener's obligation to inform the consumer:

There have been conflicting opinions about the legal nature of the intervener's obligation to inform the consumer. There is a judicial side that believes that this obligation is an obligation to achieve a result and not an obligation to exercise care. This is because the intervening producer cannot adhere to the dangers of the sold commodity (especially biologically treated products, as they contain dangerous biological and chemical materials and compounds).

As for another aspect of the law's explanations, it believes that this obligation is an obligation to exercise care, because the intervener does not control the outcome of the advice he provides to consumers; nor oblige them to follow it, as this obligation is achieved by the intervener making the appropriate effort to inform the consumer. The obligation to exercise diligence as a standard for measuring the intervener's commitment to the media has witnessed great development, especially in recent times. It has become determined in light of the risks associated with the activity carried out by the obligor, which requires him to analyze the risks surrounding and expected in his activity, and then he must exercise care commensurate with the size of these risks, according to the standard of a professional in dealing with biologically treated products.

As for the Algerian legislator, the dispute was settled under Law 09/03 relating to consumer protection and the suppression of fraud, mentioned above and consider The intervening obligation to inform the media an obligation to achieve a result by arranging a criminal penalty in the event of a violation of this obligation imposed on the intervening parties, even if no harm results to the consumer as a result of his acquisition of the product. As for the event that the product causes harm to the consumer, here civil liability is determined in addition to criminal liability (see Article 78 of Law 09/03 relating to consumer protection and suppression of fraud).

Conclusion:

Through this research, we sought to highlight the concept of legal safety and security in protecting the safety and health of consumers from biologically treated products. Especially after the high rates of cancer throughout the world and in the Arab countries and Algeria in particular, and other diseases that are transmitted to the consumer through his consumption of biologically processed and genetically modified products. Especially after the stakeholders became heavily dependent on biological materials in the industry in order to increase production and improve its quality for greater competition, not caring about the diseases that could affect the consumer Who has become prey to the temptations of technology and dazzling advertisements without knowing the health implications of the products he consumes. Hence, we sought to develop a legal regulation that addresses the intervener's commitment to consumer safety against the harms of biologically treated and genetically modified products. Especially that Algerian law in general and the Consumer Protection Law in particular lack a clear legislative treatment for this type of obligation, and are satisfied with the general texts that regulate the commitment to safety in general. We have been keen to clarify the concept of harm caused by biologically treated products, out of our desire to understand its nature, legal characteristics and the most important industrial applications of biological compounds To demonstrate the importance of specifying the dimensions of the intervener's commitment to safety against biological harm, we were also keen to consider that the law is the source of this obligation because the consumption contract cannot be relied upon as a source of the intervener's commitment to consumer safety against biological harm. Hence, we concluded our research with a set of results, the most important of which are:

- The importance of legal protection for the consumer against harm from biologically treated products, despite the importance of benefiting from biotechnology data and the applications of genetic engineering in industrial fields.
- There is a clear deficiency in national legislation regarding regulating the intervener's responsibility for compensation for biological damages.
- The difficulty of proving harm in biologically treated products and the nature of its effects on the consumer.

This research also concluded a set of recommendations, the most important of which are:

- National legislation must adopt laws that achieve a balance between considerations of consumer protection against the risks of harm from biologically treated products, and considerations of enabling the intruder to benefit from biotechnology data, to help him compete nationally and internationally.
- Legal legislators must formulate clear legal texts obligating the intervenant to protect the consumer against harm caused by biologically treated products, and not leave this to the agreement between the intervenant and the consumer in the consumption contract.
- Legal texts must be put in place that specify the specifications of the biologically safe product, and some kind of control must be exercised over the activity of those involved in observing these specifications, whether when manufacturing the product or trading it in the market.
- Liability for damage resulting from a biologically treated product must be attributed to the intervening party, the producer and manufacturer of the commodity; unless an intruding cause is proven.

Abstract
The university represents one of the social institutions with a profound impact on all other sectors within society. It has structural relationships with them and plays significant and highly impactful roles, making it a driving force for both social and economic development. It is a central actor and an active contributor to the advancement and prosperity of society. Furthermore, it is a vital cultural and intellectual hub, as it is closely linked to the societal context and to a key demographic—youth. The university also drives social dynamics, positioning it as a system that does not function in isolation from other social entities, but rather operates in an interconnected and interactive manner. Given the importance of its tasks, the university seeks to make the most of available resources and, even more, strives to innovate and create strategies that help it carry out its tasks effectively, contributing to the improvement of social life and making it more adaptable and practical. Among the bold steps taken in pursuit of this goal was the digitization of the sector in all its branches, structures, and devices. It launched dozens of electronic platforms and digital applications to manage the sector and improve the services it provides. The question driving this paper is: What are the requirements for the digitization of higher education, what challenges did the process face, and what were its impacts?

Introduction

For years, Algerian universities have been working on providing high-quality education and enhancing the outcomes of their programs. To achieve this, significant human and material resources have been allocated, alongside reforms followed by successive updates in line with both international and local transformations and developments across all levels—social, political, cultural, and technological. The latter has witnessed a massive revolution that directly impacted individuals, societies, and the world as a whole. This scientific technological revolution has affected all categories and fields.

Among the areas influenced by the technological revolution is education. On one hand, the technological revolution is the product of educational actions and the result of studies and research conducted by educational institutions, as well as the outcome of human minds that have worked within these institutions. Educational institutions have developed and refined it through their pedagogical discourses, various educational tools, methods, and approaches, aligned with scientific and technological orientations. In this context, scientific and technological training is both a goal of educational practices and an integral part of their philosophy. On the other hand, technological systems contribute to enhancing the educational process.

In its pursuit of achieving its objectives, the Algerian university has worked to keep pace with technological developments and utilize them in delivering educational content. This is clearly evident in the introduction of numerous disciplines, scientific branches, and even national schools that focus specifically on technological advancements, such as the National School of Artificial Intelligence. Additionally, efforts have been made to ensure that computer science is a core subject taught across all scientific, human, and social disciplines.

1. Concept of Digitization

The transformations experienced by societies, particularly democratic changes, have led to the addition of new tasks for educational systems. These tasks required the educational structures to expand in the range of services provided, ensuring that all service seekers are treated equally. As a result, one of the primary objectives of education has become the preparation and provision of conditions that allow every individual to access the level of education they are capable of reaching based on their abilities, readiness, and resources, through various means and for as long as possible. This necessitates working to provide equal educational opportunities for individuals who wish to pursue their education, regardless of age, geographic location, or social status. It also requires the society's ability to respond and adapt to new developments and challenges (Amer, E-Learning and E-Teaching, 2015, p. 24).

Education has become an essential and primary means for the advancement and progress of societies, particularly in the context of technological development, coinciding with the global economic shift towards a knowledge-based economy. In the face of the technological revolution, the advancement and development of communication, information, and educational media have played a significant role. The continuity of civilizations is now dependent on their response to changes and transformations across various fields. As a result, societies and countries have undergone transformations in their higher education systems, with the pace of change varying from one country to another (Ahmed, 2010, p. 09).

Modern technological tools have imposed themselves across all aspects of life, including education, by contributing to the emergence of new techniques, methods, and approaches that primarily rely on the use of modern technologies such as computers, satellites, even satellite television, and the internet. These tools aim to provide continuous education, regardless of time or location, and offer educational content in various forms—written, spoken, and visual—through diverse formats that make the learning process more enjoyable, efficient, and less time-consuming, with higher quality and less effort (Amer, E-Learning and Virtual Education: Contemporary Global Trends, 2015, pp. 19-20).

Before delving into the topic of digitization in education, it is important to address some related concepts, including technology. The earliest emergence of this term dates back to 1770 in Germany, where it referred to the systematic production of knowledge in the arts of industry or applied science. Hamelton defined it as "the means by which humans can expand their control over their surroundings." On the other hand, Ruby defines information technology as "all types of software, hardware, and equipment related to computing and communication, whether it be a personal computer, phone, or through management information systems." Digital technology refers to that branch of scientific or engineering knowledge that deals with the innovation and scientific use of digital systems, devices, and computers, along with the applications of these processes in communications, the internet, and social networking. Among the characteristics of the digital space are interactivity, dynamism, internationality, asynchrony, transformation, connectivity, and dissemination. Related concepts to technology include cyberspace, information society, artificial intelligence, communication technology, and biotechnology (Denden, 2021, pp. 13-20).

Digitalization in education, according to "Horton," refers to the use of information technology and computers to create learning experiences, while "Mank" defined it as that form of education which uses multimedia and information networks in teaching (Bouhamida, 2017, p. 81).

2. Steps of Digitalization in University Education in Algeria

Throughout the centuries, universities around the world have adapted to the significant and profound changes that human societies have undergone. The resilience, continuity, and survival of universities have been dependent on their ability to maintain their functions and tasks, as well as their capacity to adapt to changes. They have had to manage knowledge, and in recent years, new pressures have been placed on universities. These pressures include the need to strengthen changes in ideology and values, as well as the relationship between higher education institutions, the state, and society. The emergence of the knowledge society has made knowledge an indispensable part of the economic market and a driving force behind the new economy. As a result, universities have become producers of new knowledge and sources of creativity and innovation, closely linked to the economy. This has led to a redefinition of their functions as tools for generating and producing knowledge, with the economy becoming a driving force for higher education. Consequently, this has necessitated a reconsideration of university governance and management through strengthening executive leadership and weakening collective governance (Alberto Amaral, 2023, pp. 1-3).

On this basis, we can discuss the various measures undertaken by the Algerian university to employ digitization in its various departments and branches at both the pedagogical and administrative levels. This includes the transition from traditional management practices to electronic management, primarily relying on the use of artificial intelligence systems to manage the higher education sector, as well as moving from traditional education to e-learning and distance education, which depend on modern and advanced technologies to achieve the goals of educational and learning activities. This required implementing several measures and passing through various stages, starting with the training of users, including administrators and professors, to the creation of platforms and electronic applications for teaching.

Distance education had been a direction sought by the Algerian university for some time. However, one of the significant factors that acted as a strong motivator toward it was the widespread outbreak of the COVID-19 virus. This was confirmed by Mohamed Hadi, Assistant Director for Studies, Continuing Education, and Diplomas at the University Center of Tipaza (Jow Plus, 2025).

2.1 Training University Professors in the Use of Educational Media

The training of newly hired professors, offered by the University of Constantine through distance learning for several years, is a true reflection of the goals and objectives of Algerian universities to improve output levels. The importance of this training lies particularly in its focus on the technological aspect, as it emphasizes various educational platforms and media that make the educational process easier and more effective. This training is based on active and direct communication between the learner and the professor, making the learning experience more engaging. What makes this training even more significant is the wide range of information sources and the rapid flow of knowledge from numerous sources, both specialized and general, in multiple languages and formats. This poses a challenge for professors, as they are required to present content that may be provided by others around the world, in different languages, and accessible to learners at any time. This necessitates the development of their intellectual and practical abilities to deliver the same content but in a unique, engaging, and persuasive manner. The challenge here lies in maintaining the importance and quality of the information in a scientific and precise language. Therefore, training assists professors in familiarizing themselves with various technological educational tools, enabling them to deliver blended learning that preserves the value of information while presenting it in an engaging way that captures the learner's attention and encourages their active participation and assessment.

The training was divided into five workshops that are characterized by their interconnection, coordination, and integration. One of these is the third workshop, titled "Creating a Lesson on the Moodle Platform." After the previous workshop addressed the criteria for lesson design through the completed evaluation grid, this workshop focuses on designing a lesson to be placed on the Moodle platform. The lesson plan includes several elements, such as an introduction to the course and instructor, the course content, prior knowledge requirements, course objectives, evaluation methods, learning activities, and the course flow. Afterward, the lesson is designed and uploaded to the platform, with the inclusion of evaluation activities such as formative and diagnostic tests during the lesson, as well as a final test afterward. Mechanisms for interaction with learners and engaging them in the teaching-learning process are also established.

To ensure the presence of scientific and pedagogical standards in the lessons designed and placed on the platform, they should be evaluated by examiners who specialize in the field and have experience in information technology, as well as by students. Communication should be established with them, and they should be provided with a username and password that allows them to access and evaluate the content on the platform. The evaluation should rely on a unified assessment grid that covers all the lesson's contents and elements, offering a clear picture of what should be included in these lessons. In a subsequent stage, the lesson should be redesigned according to the feedback and guidance provided by the examination committee, which will help improve the content and allow the trainee to acquire experiences that will help them address mistakes and shortcomings in the future. This

process also provides an opportunity to benefit from the expertise of the examiners and to better understand the needs and comprehension levels of the students.

As for the stages of designing a lesson and uploading it to the Moodle platform, the first step is for the university administration, specifically those responsible for e-learning, to provide the professor with an account on the platform. Afterward, the professor can make changes to this account, such as changing the password and adding a personal photo. Then, the professor can upload their lessons to the platform, with many options available, such as uploading all lectures together or each lecture separately. Additionally, the lessons can be uploaded in various formats, such as Word, PDF, or video, or a combination of these formats. The professor can modify and add content at any time.

The platform also provides a space for chatting, messaging, and interactive communication with students. This enables the professor to conduct live lessons, exams, or even provide evaluation activities or discussions related to the pedagogical content being presented. Furthermore, any supplementary materials such as illustrations, diagrams, tables, charts, maps, documentaries, educational programs, or educational video clips can be added to enhance the learning experience.

One of the most notable features of the Moodle platform, in addition to the interactive nature between the student and the professor, as well as among students, is the ability to track the progress of lessons and make updates and adjustments periodically. It also offers several options that provide comfort for both the professor and the student. Moodle can support all types of e-learning, including synchronous and asynchronous learning, as well as blended learning, self-directed e-learning, and live-streamed e-learning. Furthermore, in addition to designing and uploading lessons, it allows professors to guide and advise learners, share evaluation and exam results, and interact using various available media such as chat platforms and forums. What gives this platform particular significance and makes it effective in the teaching and learning process is its availability in multiple languages, the opportunity for effective communication between training teams and learners, the continuous monitoring of the learning process, the possibility of ongoing assessment, the availability of feedback, and the ability to continuously modify and update the educational content. Additionally, it stands out for its ease of access for both the teacher and the learner.

This was followed by the fourth workshop titled "Designing an Open Source Electronic Course (MOOC)." Before discussing the details of the workshop, it is important to address the origin of the concept of "MOOC" (Massive Open Online Courses), which dates back to 2008 and is based in California. In terms of meaning, this term refers to a range of open and widely accessible online courses across various scientific and knowledge disciplines. The concept is derived from the communication theory of learning, with pioneers such as "Downes" and "Siemens" being prominent figures. One of its key principles is the emphasis on the constant and rapid change of information, the importance of linking various areas of knowledge, diversifying learning methods, and utilizing available electronic networks and social platforms. It also stresses the need to combine both cognitive and emotional aspects of learning (Al-Harthi, 2016, pp. 107-110).

The importance of this workshop lies in its practical application on how to use open-source resources for education. During the workshop, participants register on the educational platform edX, which provides a learning space where both instructors and students can interact to achieve the main objectives of the lessons. This is a global, international platform that offers open-source online courses, which can be accessed easily at any time, allowing for lessons to be presented in various formats, including educational videos.

In addition to this platform, we can also mention Coursera, which has agreements and contracts with over 62 major universities worldwide, such as the University of Pennsylvania, the University of Philadelphia, and Stanford University. It is also free and non-profit, offering courses in various scientific fields and in different languages. Another platform to note is Udacity, founded by Sebastian Thrun, Mike Sokolsky, and David Stavens, which offers educational courses for learners as well as professional courses for those wishing to specialize in a particular field.

At the Arab level, three platforms can be highlighted as pioneers in this field: Edraak, Rwaq, and Zadi. The Edraak platform was founded by the Queen Rania Foundation for Education and Development, with the participation of Sheikh Mohammed bin Zayed Al Nahyan, Crown Prince of the Emirate of Abu Dhabi, in an effort to develop Arab education and improve education in Arab societies. This is achieved through the platform's offering of high-quality educational courses supervised by experts and specialists from both Arab and non-Arab countries. The platform presents educational content at various levels, and upon completing the courses, learners can obtain qualifications. It also provides users with the opportunity to suggest ideas for developing the platform and the courses it offers.

Rwaq, which is managed by specialists from various countries around the world, is one of the oldest e-learning platforms. It offers many free educational contents in Arabic, targeting different social groups, including students,

teachers, or anyone interested in developing their cognitive abilities. Users of the platform receive a certificate after successfully completing a course.

As for the Zadi platform, which is managed by Mohamed Saleh Al-Munjid and was established in 2015, it specializes in Islamic studies. One of its goals is to bring religious knowledge closer to people by organizing periodic training courses.

2.2 Digital Applications Used in Algerian Higher Education

One of the most prominent characteristics of the current era is the significant scientific and technological advancement, which has led to numerous transformations and changes across various aspects of life—socially, culturally, economically, and educationally. This era is now recognized as the age of digitization. As a result, one of the main goals of education has become development, modernization, and keeping pace with the progress of modern technology, with the aim of creating an interactive learning environment to capture learners' attention and facilitate the exchange of ideas and experiences among them. Information technology is one of the most important and effective means of providing such an environment. These technologies allow professors to access knowledge, experiences, and skills, as well as to learn from educational practices (Ahmed, 2010, pp. 42-44).

2.2.1 Business Incubators Monitoring Platform

Business incubators are defined as physical spaces that provide a range of services for individuals and small businesses. These may also include the provision of office spaces that companies need to start their operations, under flexible rental conditions, in addition to providing the necessary financial and technical support, legal and financial facilities, as well as human resources and various services that allow companies to continue operating. The Technology Center in Jordan, "ipark," defines it as a dynamic process for developing business projects that focuses on young companies, supporting them to achieve survival and growth during the startup phase, which is when they are most vulnerable (Fatima Maamri, 2023, pp. 22-23).

In pursuit of achieving the goals of Algerian universities, which include opening up to the economic environment to provide job opportunities for university graduates, the Algerian Ministry of Higher Education and Scientific Research adopted a policy to support innovative projects in order to make significant contributions to economic development. This was done by establishing a support unit for university business incubators at various university institutions across the country. The initiative began at Mohamed Boudiaf University in M'sila, which became the first incubator to receive the "Label" certification. It was then included in the guide of business incubators by the ministry responsible for emerging businesses and the knowledge economy, to spread the concept and establish many incubators at Algerian universities (Fatima Maamri, 2023, p. 29).

It is noteworthy that initiatives aimed at achieving sustainability in higher education gained significant momentum since 2019, particularly after the election of Abdelmadjid Tebboune as President of Algeria following the political movement that occurred in the same year. During this political transition, special focus and attention were placed on the higher education and scientific research sector, with a clear and direct call for its improvement and development. This focus reflects and reinforces the strong relationship between the educational system in general, and university education in particular, and the economic structure.

In 2020, efforts intensified to link higher education with sustainable economic plans, in line with the goals of diversifying the economy. One manifestation of this connection was the establishment of university business incubators, which aim to support students in innovating and developing business models and creating startups. These incubators serve as mechanisms for integrating academic knowledge and expertise with practical skills, while promoting a culture of innovation and sustainability.

In 2022, Ministerial Decree No. 1244 was issued, establishing a national coordination committee to monitor innovation and university business incubators. The committee's duties include overseeing the development and innovation of projects within universities and ensuring that innovative projects align with national sustainability goals. This committee serves as a central body coordinating efforts, tracking progress, and providing necessary guidance to enhance innovation and entrepreneurship in higher education. Furthermore, Ministerial Law No. 1275, dated September 27, 2022, outlines the framework for higher education strategy and the process of student-driven startup creation, specifying all the steps and stages involved, as well as the parties participating. These decisions affirm Algeria's commitment, through its universities, to driving economic growth and diversification, with sustainability as a central goal, while also emphasizing creativity and innovation (Salim Bouherar, 2025, pp. 01-03).

- Electronic Clearance Portal: This platform facilitates the clearance process and reduces the burdens on those responsible for clearance within university institutions and services.
- Statistics and Performance Indicators Platform: This platform contains data on the needs of university administrations, which is obtained through precise statistics based on artificial intelligence systems. The

data is presented in tables and graphical curves to measure performance indicators and their requirements.

- Chatbot: Aimed at students, this tool is available on the official website of the Ministry of Higher Education and Scientific Research. Its main tasks include answering students' inquiries and concerns regarding registration, orientation, and various administrative procedures.
- Thesis Portal: Established by decision No. 153 issued on May 14, 2012, concerning the creation of a central file for storing theses and how to benefit from this process. It is considered an important and necessary tool to support research, production, and scientific work.
- Platform for Detecting Academic Plagiarism and Citation Percentage: This platform uses a dedicated program to detect the percentage of plagiarism in theses and dissertations, as well as to identify instances of academic dishonesty.
- Platform for Managing and Monitoring Student Movements: This platform aims to address students' inquiries related to monitoring and supervision.
- Platform for Managing and Monitoring Joint Supervision of Doctoral Theses: This platform is designated for theses that involve joint supervision. It allows for providing necessary feedback, offering guidance to facilitate smooth progress, and exchanging expertise in this field.
- Platform for Monitoring Administrative and Technical Users: This platform enables the monitoring of employees' activities, focusing on the performance delivered, competencies, and positions held.
- Platform for Managing and Monitoring International Students: The primary purpose of this platform is to streamline the processes and procedures related to the studies of international students in Algeria.
- Platform for Managing and Monitoring Training and Internships Abroad: This platform includes a set of procedures that allows both professors and students wishing to pursue internships and training abroad to enhance their academic level.
- Digital Platform for Renewing University Scholarships Abroad: This platform is designed for students, enabling them to renew their university scholarships for studying abroad.
- Platform for Managing University Research Training Projects (PPRFU): This platform is dedicated to professors and is supervised by the General Directorate of Education and Training. Through this platform, research project proposals and various works completed in research laboratories are submitted for monitoring and evaluation.
- University Cinema Platform: This platform showcases purposeful artistic works created by students and approved for presentation at university festivals for short and feature films.
- Certification Documentation Platform: This platform is designated for graduates, aiming to simplify the process of certifying the degrees earned, whether a bachelor's, master's, or doctoral degree, and it helps improve the quality of services provided.
- University Transport Platform: This platform includes a database that allows students and even the Directorate of University Services to monitor the movement of university transport buses in terms of time and destination.
- Catering Platform: This platform serves as a means to monitor and measure the catering process by establishing a database.
- University Dormitory Access Monitoring Platform: This pertains to the organization and monitoring of student access to university dormitories. These platforms have been supported by mobile applications, including the following:
    - E-services Application: A mobile application designed for smartphones that serves as a gateway to all services and digital platforms for users within the sector.
    - Web Etu Application: A mobile application for the integrated information system "Progres," which enables students to register, re-register, track their academic progress, and obtain necessary documents.

The following table outlines the main digital platforms that have been discussed:

Table 1. Some Digital Applications in the Higher Education and Scientific Research Sector

Digital Platforms	Link	Usage	Target Audience
dual Platform	http://dual.mesrs.dz	Teaching and learning English remotely for students and faculty	Students and Faculty

		members	
padoc Platform	http://padoc.mesrs.dz	Teaching English to first-year doctoral students	Doctoral Students
Student Platform (ask-me)	http://ask.mesrs.dz	Students submit questions and receive responses from pedagogical staff	Students
PubMed – Algerian Medical Publications Platform	http://pubmed.mesrs.dz	Institutional repository for researchers in the health sector across all specialties	Medical Students and Clinical Professors

3. Results of the Digitization of Higher Education

One of the advantages of e-learning is its ability to transcend time and space, as it is accessible anytime and anywhere. It also reduces the cost of education, increases the return on investment, and contributes to breaking psychological barriers between the teacher and the learner. Furthermore, it satisfies the characteristics and aspirations of learners by considering their specific needs. It also allows for immediate and automatic assessment of

learners, as well as direct access to knowledge and expertise from primary sources. Additionally, it fosters interactivity between learners and teachers and reduces the burdens of travel for learners (Tariq Abdel-Raouf Amer, 2015, p. 27).

Kamal Badaari, Minister of Higher Education, confirmed that the goal of digitization is simplification and efficiency through organization and reorganization. The process followed a master plan consisting of seven major axes and 102 operational programs, which will be implemented before the end of 2024. He emphasized that the higher education sector is the only one that possesses an integrated information system. This was also confirmed by Yassine Belkhouja, Deputy Director of Information Systems at the Ministry of Higher Education. The aim of designing and developing digital programs is to facilitate and simplify access to information for the sector's users, in order to reduce the burden on students, who would otherwise need to travel to universities to complete various processes, including registration and obtaining a student ID (Ennahar TV, 2025). The key impacts of digitization can be summarized as follows:

- Simplifying and facilitating access to services for users in the sector.
- Reducing the travel burden for students.
- Saving time, effort, and money.
- Addressing all the questions and concerns raised by students.
- Reducing costs for both service providers and service seekers.

Economically, "Kherchi Iskak," Director of the Higher School of Commerce, confirmed that the electronic applications used in the higher education sector have helped rationalize expenditures and reduce pressure. The "my bus" app, for example, saved 62 million Algerian dinars within two months (Dr. Ishak Kherchi, 2025).

The importance and outcomes of this on the educational process are reflected in the effort to increase the effectiveness of the educational process by actively contributing to the use of information and communication technologies in teaching and learning. This contributes to improving the quality of the educational process and the quality of outcomes. It also helps in providing a high-quality learning environment and enriching the fields of human knowledge to keep pace with global transformations, adapt to innovations in technology, encourage self-directed and lifelong learning, and develop critical thinking. Additionally, it plays a role in achieving the goals of higher education by assisting universities in performing their functions, whether related to providing quality education, developing management, and shifting towards electronic administration, or enhancing transparency in administrative dealings, while establishing principles of democracy and equal opportunities among learners and various university stakeholders. It also allows for expanding the scope of the educational process by enabling everyone to access various sources of knowledge (Bouzaïb, 2022, p. 72).

On the level of scientific research, digitization has contributed to facilitating the research process by providing high-quality scientific material and enabling students to access the references and sources they need with minimal effort and in less time. It has also played a crucial role in benefiting from global experiences in the field of scientific research. This is evident from the mechanisms that allowed for the organization of scientific events through distance learning technologies, facilitating the research process, accessing references from abroad, interacting with researchers from different countries, exchanging knowledge and experiences, and benefiting from research results and studies (Bloul, 2023, pp. 497-499).

Conclusion

The university constitutes an intellectual, scientific, social, and cultural system that can only be understood within the framework of its relationships with the social structure, cultural conditions, and historical context of its existence. It is made up of a set of sub-systems that interact to achieve the major objectives for which it was established. Digitization has become an important strategic choice adopted by the Algerian university to keep up with the digital transformation that has characterized the world in this millennium. Digitization is considered a tool and means, not an end in itself; a tool to facilitate the work of higher education sector users and assist them in fulfilling their professional duties by utilizing the benefits of technology, as well as to improve the quality of services provided by this sector to the individual, society, and nation.

The adoption of digitalization in the management of the higher education sector has occurred in stages, with various levels of implementation. This began with platforms for registration in recruitment competitions organized by the sector, platforms for registering successful candidates in the baccalaureate exams, and the subsequent processes of orientation, selection of scientific fields, appeals, and transfers from one specialty to another and from one university to another. It also includes the registration processes for university services such as accommodation, transportation, and scholarships, as well as platforms for viewing exam results. The Moodle platform, which is an

educational platform that allows university students to access the knowledge and information they need, is also part of this digital transition. There are many other platforms, including those for submitting complaints or addressing questions and concerns.

Believing in its central role in the economy, Algerian universities have not only focused on training the executives and skills needed by economic institutions, but have also gone further by creating job opportunities through business incubators. These incubators foster the development of start-ups that contribute to job creation and provide products needed by the national market to meet the needs of individuals.

Keywords Teaching competencies, vocational training instructors, vocational training, trainees.

Abstract
This study aims to examine the extent to which vocational training instructors apply teaching competencies, as perceived by trainees. To achieve this objective, a descriptive survey methodology was employed, utilizing a questionnaire as the primary research instrument. The questionnaire consisted of 41 items categorized into four domains: lesson planning, lesson implementation, lesson assessment, and classroom communication and interaction. The study sample comprised 233 trainees enrolled at the National Institute of Specialized Vocational Training in Management in Guelma during the 2023/2024 academic year. Data analysis and hypothesis testing were conducted using the SPSS statistical software. The findings indicate that vocational training instructors demonstrate a high level of competency in lesson planning, implementation, assessment, and classroom communication and interaction.

Introduction / Research Problem

The advancement of nations is increasingly dependent on their knowledge capital and the presence of a well-educated, skilled workforce capable of innovation, productivity, and competition. In Algeria, the vocational training and education sector is recognized as a strategic pillar for national development. The government relies on this sector to supply a qualified workforce that meets labor market demands and contributes to sustainable economic, social, and service-sector development. This is achieved through investment in human capital, equipping individuals with the necessary skills and competencies for labor market integration and active participation in society.

Vocational training institutions are responsible for preparing a highly skilled and well-trained workforce ready to enter the job market. However, this objective can only be realized if vocational training instructors possess a high level of teaching competencies. These instructors serve as the cornerstone of any successful training process, requiring a blend of academic, professional, personal, and social qualifications. It is widely acknowledged that instructors play a crucial role in shaping the quality of vocational training outcomes to align with contemporary technological and industrial advancements. They instill perseverance and a strong work ethic in trainees while equipping them with both theoretical knowledge and practical skills. Moreover, they ensure that trainees acquire comprehensive expertise in their respective fields, enabling them to integrate effectively into the workforce.

Understanding teaching competencies is of paramount importance, as they constitute the minimum essential skill set required to achieve desired educational outcomes efficiently, minimizing time and effort while maximizing effectiveness. This underscores the need to focus on instructors' competencies in lesson planning, implementation, assessment, and classroom communication and interaction. Deficiencies in these areas can significantly hinder the achievement of vocational training objectives.

Given that instructors' competency levels may vary, this study seeks to assess current instructional practices, their effectiveness, areas of improvement, and the extent to which vocational training instructors incorporate modern teaching methods. Since instructors' performance serves as a key indicator of vocational training effectiveness, the study aims to address the following primary research question:

- **To what extent do vocational training instructors apply teaching competencies from the perspective of trainees?**

From this central question, the study explores the following sub-questions:

- To what extent do vocational training instructors apply lesson planning competencies from the perspective of trainees?
- To what extent do vocational training instructors apply lesson implementation competencies from the perspective of trainees?
- To what extent do vocational training instructors apply lesson assessment competencies from the perspective of trainees?
- To what extent do vocational training instructors apply classroom communication and interaction competencies from the perspective of trainees?

1. Research Hypotheses

General Hypothesis:

- Vocational training instructors demonstrate a high level of teaching competency, as perceived by trainees.

Sub-Hypotheses:

- Vocational training instructors demonstrate a high level of competency in lesson planning, as perceived by trainees.
- Vocational training instructors demonstrate a high level of competency in lesson implementation, as perceived by trainees.
- Vocational training instructors demonstrate a high level of competency in lesson assessment, as perceived by trainees.
- Vocational training instructors demonstrate a high level of competency in classroom communication and interaction, as perceived by trainees.

2. Research Objectives

This study aims to assess the extent to which vocational training instructors apply teaching competencies—including lesson planning, implementation, assessment, and classroom communication and interaction—from the perspective of trainees.

3. Significance of the Study

This study highlights the importance of the vocational training sector, which plays a crucial role in professional development and sustainable economic growth. It also emphasizes the vital role of vocational training instructors. Ensuring their effectiveness and competency directly impacts trainees' ability to acquire the necessary knowledge and skills to perform their professions and trades at the highest level.

Additionally, this study contributes to diagnosing the current state of teaching competencies and assessing the extent to which instructors possess them. Furthermore, it provides findings that may aid relevant authorities in decision-making, enhancing, and developing teaching competencies among vocational training instructors. This is achieved by equipping vocational training and education supervisors with a comprehensive list of instructors' training needs related to teaching competencies, which can be utilized for guidance and professional development.

4. Review of Previous Studies

A review of various studies focusing on teaching competencies among instructors is presented below, arranged chronologically from the earliest to the most recent:

1. Al-Hashem & Al-Moussawi (2003): this study aimed to assess the performance level of social studies teachers for sixth-grade students in Bahrain based on fundamental teaching competencies. Using a descriptive research approach, the researchers developed a checklist of essential teaching competencies and a classroom observation tool. The study was conducted on a sample of 28 teachers. The findings revealed that 42% of the competencies were performed at a high level of proficiency, 31% at a moderate level, and 27% at a low level. Teachers demonstrated moderate proficiency in lesson planning and implementation. (Jamal Suleiman, 2011, p. 340)

2. Al-Ghaziwat (2005): This study evaluated teaching competencies among faculty members of the Faculty of Educational Sciences at Mu'tah University, as perceived by social studies students, considering gender and academic level as variables. The descriptive methodology was applied, and a questionnaire was administered to a sample of 216 students. The results indicated that most faculty members still relied on traditional teaching methods, where the teacher remained the primary source of knowledge, and students played a passive role. The study also found that faculty members were often rigid in their opinions, showed little sensitivity to students' psychological and academic challenges, relied heavily on essay-based exams, and primarily used summative assessment methods.

Regarding communication competencies, the study showed that while some instructors treated students equitably, others adopted an authoritative approach. T-test results indicated statistically significant differences at the 0.05 level in students' evaluations of faculty performance, favoring female instructors in assessment and interpersonal skills.

3. Daidish (2006): This study aimed to evaluate the teaching competencies (planning, implementation, and assessment) of first-year middle school mathematics teachers in Sétif, considering the impact of training type and teaching experience. The study adopted a descriptive evaluative approach, using an observation checklist applied to a randomly selected cluster sample of 31 mathematics teachers. The results revealed variation in individual teachers' competency levels, with overall teaching performance falling below the high proficiency threshold of 70%. No statistically significant differences were found based on training type or experience.

4. Rababaa (2015): This study explored the extent to which faculty members at the College of Sharia and Islamic Studies at Qassim University possessed teaching competencies from their own perspectives during the 2014/2015 academic year. A sample of 97 faculty members was selected randomly, and the study adopted a descriptive survey approach using a questionnaire as the primary research tool. The results showed that faculty members demonstrated a high level of competency in lesson planning, implementation, and assessment.

5. Abdul-Momani (2019): This study aimed to identify the teaching competencies of vocational education teachers in basic schools under the Directorate of Education in Ajloun, Jordan. It focused on competencies related to lesson implementation and teaching methods. A descriptive research approach was employed, and a questionnaire consisting of 26 items was administered to a sample of 50 teachers. The findings indicated an overall competency level of 73%, surpassing the lesson implementation competency, which scored 71%.

6. Slimani (2020): This study examined the actual practice of teaching competencies among primary school teachers in Tiaret, employing a descriptive methodology. A structured observation checklist was applied to a purposive sample of 130 teachers from 18 primary schools. The findings revealed that primary school teachers generally exhibited satisfactory teaching competencies, with classroom interaction being the most effectively demonstrated competency.

Critique of Previous Studies

A review of previous research indicates that the topic of teaching competencies has garnered significant interest among educators. The key points of comparison between the reviewed studies are as follows:

- **Objective:**
  The studies varied in their objectives:
  - Some focused on assessing the **actual practice** of teaching competencies among faculty members, such as *Slimani (2020)*.
  - Others aimed at **evaluating** teaching competencies, like *Daidish (2005)* and *Al-Ghaziwat (2005)*.
  - Some studies examined the **extent to which faculty members possess** teaching competencies, as in *Rababaa (2015)*.
  - In contrast, the present study seeks to determine the **degree of application** of teaching competencies among vocational training instructors.
- **Methodology:**
  The studies differed in their research approaches:
  - Several studies employed a **descriptive methodology**, such as *Al-Hashem & Al-Moussawi (2003)*, *Al-Ghaziwat (2005)*, *Abdul-Momani (2019)*, and *Slimani (2020)*.
  - Some adopted a **descriptive evaluative approach**, like *Daidish (2005)*.
  - The current study aligns methodologically with *Rababaa (2015)* in utilizing a **descriptive survey approach**.
- **Sample:**

- Some studies, such as *Al-Ghaziwat (2005)*, targeted **university students**.
- Other studies focused on **faculty members**, as in *Daidish (2005)*, *Rababaa (2015)*, and *Abdul-Momani (2019)*.
- The present study differs from all previous studies as it selects **trainees** as its sample.

- **Research Instrument:**
  - Most previous studies, including the present study, utilized **questionnaires** for data collection.
  - However, *Slimani (2020)* and *Daidish (2005)* used **structured observation checklists**.
- **Findings:**
  The results of previous studies varied depending on their specific objectives.

The current study stands out from related research as one of the few studies—**to the researcher's knowledge**—that examines the **degree of application** of teaching competencies among vocational training instructors, as perceived by trainees in vocational institutions in Guelma.

The review of prior research provided valuable insights in:

- Formulating the research problem.
- Expanding theoretical knowledge related to teaching competencies.
- Selecting the appropriate research methodology.
- Choosing the most effective data collection tool.
- Analyzing, discussing, and interpreting results.
- Identifying relevant sources and references.

5. Operational Definitions of Study Terms

- **Teaching Competencies:**In this study, teaching competencies refer to the ability of vocational training instructors to effectively perform lesson planning, implementation, assessment, and classroom communication and interaction at a high level of proficiency. These competencies are measured based on the total raw scores obtained by vocational training instructors through trainees' responses to the teaching competencies questionnaire developed for this study.
- **Vocational Training Instructors:**This term refers to first- and second-rank instructors specializing in vocational training and education, who practice their profession at the National Institute of Specialized Vocational Training in Management in Guelma during the 2023/2024 training year.
- **Trainees:**The trainees in this study are individuals enrolled in vocational training through in-person training programs at the National Institute of Specialized Vocational Training in Management in Guelma during the 2023/2024 training year.

6. Theoretical Background of the Study

7.1. Teaching Competency

Definition of Competency

- **Al-Duraij (2003)** defines competency as:
  "Acquired abilities that enable an individual to act and perform in a specific context, comprising integrated knowledge, skills, and attitudes. An individual utilizes these abilities to address and solve problems within a given situation." (Mohammed, 2003, p. 16)
- **Good (as cited in Al-Shaib & Bin Zahi, 2011)** defines competency as:
  "The ability to achieve desired outcomes efficiently, minimizing effort, time, and expenses." (Al-Shaib & Bin Zahi, 2011, p. 16)

- **Al-Fatlawi (2003)** defines competency as:
  "A set of behavioral abilities expressed through cognitive, skill-based, and affective tasks that contribute to the expected final performance at a satisfactory level of effectiveness. These abilities can be observed and evaluated through various assessment methods." (Al-Fatlawi, 2003, p. 29)

Based on the above definitions, competency can be understood as an acquired ability manifested through a combination of cognitive, skill-based, and affective activities. It is demonstrated by an individual effectively and proficiently, with minimal effort and cost, and within optimal time constraints.

Teaching Competencies

Definition of Teaching Competencies

- **Mur'i (1983)** defines teaching competencies as:

  "Precisely and clearly defined behavioral objectives that describe all the knowledge, skills, and attitudes necessary for a teacher to achieve effective teaching."

- **Muslim (as cited in Karam, 2002, p. 130)** defines them as:

  "A set of abilities and skills that a teacher must possess, enabling them to effectively and efficiently fulfill their duties, roles, and responsibilities, ultimately enhancing the educational process—particularly in terms of the teacher's ability to successfully transfer knowledge to students."

From the above definitions, it can be concluded that teaching competencies encompass a combination of behavioral and cognitive objectives that teachers must master to ensure effective teaching.

7.2. Classification of Teaching Competencies

Several educational studies have proposed different classifications of teaching competencies. Below are some notable models:

- **Robert's Classification (1975):**Presented at the annual meeting of the **American Educational Research Association (AERA)**, this classification—later known as **Robert's Teaching Competency Model**—includes the following domains:
  1. Knowledge
  2. Behavior
  3. Attitudes
  4. Outcomes and Effects
  5. Experience *(Muflih, 1998, p. 63)*
- **Al-Laqani & Radwan's Classification:**This classification categorizes competencies as follows:
  1. Teaching proficiency
  2. Effective use of psychology
  3. Establishing positive interpersonal relationships within the institution
  4. Connecting the school with the local community
  5. Leadership ability
  6. Ability to fulfill professional responsibilities *(Al-Fatlawi, 2003, pp. 56-57)*

- **Fawzi Attwa's Classification:**Based on the level of specificity and generalization, teaching competencies were divided into three categories:
  1. General Educational Competencies
  2. Specific Educational Competencies
  3. Supportive Competencies *(Al-Azraq, 2000, p. 28)*
- **Al-Fatlawi's Classification (2003):**
  1. Scientific Competency and Professional Development
  2. Competency in Educational Objectives and Philosophy
  3. Lesson Planning Competency
  4. Lesson Implementation Competency
  5. Interpersonal Skills and Classroom Management Competency *(Al-Fatlawi, 2003, pp. 56-57)*

Classification of Teaching Competencies in the Present Study

Based on the research objectives and in light of the aforementioned classifications, the present study classifies teaching competencies into the following four domains:

1. Lesson Planning Competency
2. Lesson Implementation Competency
3. Lesson Assessment Competency
4. Classroom Communication and Interaction Competency

7.3. Vocational Training

- **Aqili (2005)** defines vocational training as:

  "A structured process consisting of planned programs designed to equip human resources with the necessary knowledge and skills to perform their current jobs at a high level of proficiency through continuous improvement and performance development."

- **Pierre Casse (1949, p. 48)** defines vocational training as:

  "A process aimed at developing individuals' professional and technical skills to enhance their efficiency and effectiveness in carrying out tasks and responsibilities related to their current or future jobs."

From these definitions, vocational training can be understood as a systematic and pre-planned process that imparts essential knowledge and skills to trainees, enabling them to perform their professional duties with high efficiency and competence.

Role and Responsibilities of Vocational Training Instructors

According to official decrees and regulations, the responsibilities of vocational training instructors vary depending on their rank. This study focuses on first- and second-rank instructors, as defined in Articles 32 and 33 of the Official Gazette (2009, pp. 7-8).

Responsibilities of First-Rank Vocational Training Instructors (Article 32):

First-rank instructors are responsible for all forms of vocational training and are specifically assigned the following duties:

- Delivering theoretical and practical instruction in one or more subjects.
- Supervising internships and professional development courses for vocational training instructors.
- Participating in organizing, conducting, and evaluating professional examinations, tests, and competitions.
- Assisting in the planning and evaluation of vocational training programs in professional settings.
- Contributing to the development of training curricula and reference materials.
- Engaging in technical and pedagogical research.
- Required to conduct 18 to 22 teaching hours per week.

(Source: Official Gazette, 2009, pp. 7-8)

Responsibilities of Second-Rank Vocational Training Instructors (Article 33):

Second-rank instructors hold advanced teaching and training responsibilities, including:

- Delivering **theoretical and practical instruction** in one or more subjects.
- Training **vocational training supervisors and managers**.
  - Providing **professional development training** for vocational training instructors.
  - Offering **advanced training and capacity-building programs** for first-rank instructors.
  - Organizing and overseeing **competitions, professional examinations, and assessments**.
  - Conducting **research and developing vocational training curricula**.
  - Designing and preparing **lesson content and pedagogical resources** for vocational training institutions.
  - Required to conduct **18 to 22 teaching hours per week**.

(Source: Official Gazette, 2009, p. 8)

From the above, it can be concluded that, regardless of rank, vocational training instructors hold significant responsibilities in technical, pedagogical, and training aspects, as well as in management and administration. In addition to their instructional role, they are subject matter experts tasked with effectively delivering both theoretical knowledge and practical skills to trainees, ensuring a well-rounded vocational education.

7. Methodological Procedures of the Study

8.1. Research Methodology

To achieve the objectives of the present study, the descriptive survey method was adopted, as it is the most suitable approach for this research.

8.2. Study Population

8.2. Target Population

The target population consists of trainees (both male and female) enrolled in in-person vocational training programs at the National Institute of Specialized Vocational Training in Management in Guelma. As of April 2024, based on the monthly report from the In-Person Training and Internship Monitoring Service, the total number of trainees was 315.

8.2.2. Statistical Population

The statistical population consists of trainees enrolled in four semesters at the institute, totaling 233 trainees.

Table 1: Distribution of the Statistical Population by Gender and Specialization

Specialization	Number of Branches	Semester	Males	Females	Total
Human Resource Management	1	4	06	29	35
Documentation & Archiving	1	3	06	05	11
Digital Systems (IT & Networks)	1	3	07	04	11
Early Childhood Education	1	2	0	30	30
Executive Secretariat	2	2	06	52	58
Accounting & Management	2	2	10	41	51
Human Resource Management	2	1	11	26	37
Total	-	-	46	187	233

The questionnaire was administered to all members of the statistical population (233 trainees) enrolled at the National Institute of Specialized Vocational Training in Management in Guelma.

8.3. Data Collection Instrument

To measure teaching competencies among vocational training instructors, a questionnaire was developed after reviewing theoretical literature and previous related studies. The questionnaire consists of four domains with 41 items, as shown in the table below.

Table 2: Distribution of Questionnaire Items by Domain

Domain	Number of Items	Item Numbers
Lesson Planning Competency	07	1, 2, 3, 4, 5, 6, 7
Lesson Implementation Competency	15	8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22
Lesson Assessment Competency	10	23, 24, 25, 26, 27, 28, 29, 30, 31, 32
Classroom Communication & Interaction Competency	09	33, 34, 35, 36, 37, 38, 39, 40, 41

The questionnaire was structured using a **three-point Likert scale** with response options:

- **High** (3)
- **Moderate** (2)
- **Low** (1)

Table 3: Interpretation of Teaching Competency Scores by Domain

Score Range	Competency Level

Score Range	Competency Level
[1 – 1.66]	Low
[1.67 – 2.33]	Moderate
[2.34 – 3]	High

8. Psychometric Properties of the Study Instrument (Validity and Reliability)

Following the preparation of the questionnaire, it was administered to a pilot sample of 15 trainees. The Statistical Package for the Social Sciences (SPSS) was used to analyze the data and assess the psychometric properties of the instrument.

9.1. Validity

To ensure the validity of the questionnaire, two types of validity were examined:

1.9.1. Face Validity

Face validity was assessed by presenting the initial version of the questionnaire to a panel of experts specializing in pedagogical engineering. The experts evaluated the clarity of the items and their relevance to the measured domains. Based on their feedback, some items were reworded or clarified, and the instrument was finalized for pilot testing.

1.9.2. Intrinsic Validity

Intrinsic validity refers to the accuracy of the test results, ensuring they are free from measurement errors. It is determined by calculating the square root of the reliability coefficient:

Intrinsic Validity=Reliability Coefficient\text{Intrinsic Validity} = \sqrt{\text{Reliability Coefficient}}Intrinsic Validity=Reliability Coefficient

Table 4: Intrinsic Validity of the Questionnaire

Intrinsic Validity	Total Items	Sample Size
0.864	41	15

The table indicates that the **intrinsic validity of the questionnaire is 0.864**, which is **high**, confirming the validity of the questionnaire items.

9.2. Reliability

To assess the reliability of the study instrument, **Cronbach's Alpha** coefficient was calculated. The results are presented in the table below:

Table 5: Cronbach's Alpha Reliability Coefficient

Cronbach's Alpha	Total Items	Sample Size
0.748	41	15

The **Cronbach's Alpha value** for the questionnaire is **0.748**, which is **high**, indicating strong reliability. This confirms that the questionnaire is **consistent and suitable for application** in the study.

9. Study Scope

10.1. Time Scope

The main study was conducted during the second semester of the 2023/2024 training year.

10.2. Spatial Scope

The fieldwork was carried out at the National Institute of Specialized Vocational Training in Management – Djebabla Kaddour in Guelma.

10.3. Human Scope

The study targeted trainees enrolled in in-person vocational training programs across four semesters, totaling 233 trainees for the 2023/2024 training year.

10. Statistical Methods Used

Data were processed using the Statistical Package for the Social Sciences (SPSS) to calculate:

- Arithmetic means
- Weighted averages
- Standard deviations
- Cronbach's Alpha correlation coefficient to assess the reliability of the study instrument.

11. Presentation and Discussion of Study Results

12.1. Presentation and Discussion of the First Hypothesis Result

Hypothesis 1:

"The degree of application of lesson planning competency among vocational training instructors is high from the perspective of trainees."

To test this hypothesis, arithmetic means and standard deviations of respondents' answers for the first domain were calculated.

Table 6: Arithmetic Mean and Standard Deviation for Lesson Planning Competency

Domain	Arithmetic Mean	Standard Deviation	Level
Lesson Planning Competency	2.39	0.49	High

The results of Table 6 indicate that the arithmetic mean of respondents' answers for the first domain is 2.39, with a standard deviation of 0.49, suggesting that the degree of application of lesson planning competency is high.

This outcome can be attributed to the significant emphasis placed on lesson planning by vocational training instructors, reflecting strong control over planning elements. This proficiency contributes to performance improvement and enhances the overall training process.

The instructors' commitment to lesson planning is evident in their effective execution of tasks, including:
✔ Thorough and well-structured preparation of training sessions
✔ Clear definition of steps and required stages
✔ Balancing the selection of appropriate instructional methods, tools, and activities
✔ Conducting assessments and setting clear learning objectives
✔ Ensuring trainees acquire the necessary skills to achieve the desired learning outcomes in an optimal timeframe

These factors collectively contribute to reducing randomness in the teaching process, ensuring a structured and effective training environment.

This finding aligns with Rababaa (2015), which concluded that faculty members demonstrated high competency levels in lesson planning, implementation, and assessment. However, it contrasts with Al-Hashem & Al-Moussawi (2005), which found that the level of mastery of lesson planning competency was moderate (31%). Additionally, it disagrees with Daidish (2006), which reported weak performance in core teaching competencies (planning, implementation, and assessment) compared to the high competency benchmark of over 70%.

12.2. Presentation and Discussion of the Second Hypothesis Result

Hypothesis 2:

"The degree of application of lesson implementation competency among vocational training instructors is high from the perspective of trainees."

To test this hypothesis, arithmetic means and standard deviations of respondents' answers for the second domain were calculated.

Table 7: Arithmetic Mean and Standard Deviation for Lesson Implementation Competency

Domain	Arithmetic Mean	Standard Deviation	Level
Lesson Implementation Competency	2.35	0.51	High

The results indicate that the arithmetic mean for lesson implementation competency is 2.35, with a standard deviation of 0.51, suggesting a high level of application.

This suggests that instructors demonstrate strong competency in lesson execution, particularly in:
✔Engaging trainees' interest at the beginning of lessons
✔Using varied teaching methods tailored to trainees' characteristics
✔Effectively utilizing instructional resources
✔ Providing continuous monitoring, feedback, and guidance

This result aligns with Abdul-Momani (2019), where lesson implementation competency scored 3.43 (71%), indicating a high competency level. It also agrees with Rababaa (2015), which found that faculty members possessed high competency levels in planning, implementation, and assessment.

12.3. Presentation and Discussion of the Third Hypothesis Result

Hypothesis 3:

"The degree of application of lesson assessment competency among vocational training instructors is high from the perspective of trainees."

To test this hypothesis, arithmetic means and standard deviations of respondents' answers for the third domain were calculated.

Table 8: Arithmetic Mean and Standard Deviation for Lesson Assessment Competency

Domain	Arithmetic Mean	Standard Deviation	Level
Lesson Assessment Competency	2.34	0.55	High

The results indicate that the arithmetic mean for lesson assessment competency is 2.34, with a standard deviation of 0.55, suggesting a high level of application.

This result suggests that vocational training instructors understand the importance of assessment in the training process, as it influences trainees' cognitive, affective, and psychomotor development.

Key aspects of assessment competency include:
✔ Identifying trainees' strengths and reinforcing them
✔ Diagnosing weaknesses and applying corrective measures
✔ Utilizing diverse assessment tools (oral, written, and practical evaluations)
✔ Ensuring alignment between assessment tasks and learning objectives

This result aligns with Rababaa (2015), which found that faculty members demonstrated a high level of competency in assessment. However, it contrasts with Al-Ghaziwat (2005), which found that instructors relied heavily on essay-based exams and final assessments, rather than utilizing diverse evaluation methods.

12.4. Presentation and Discussion of the Fourth Hypothesis Result

Hypothesis 4:

"The degree of application of classroom communication and interaction competency among vocational training instructors is high from the perspective of trainees."

To test this hypothesis, arithmetic means and standard deviations of respondents' answers for the fourth domain were calculated.

Table 9: Arithmetic Mean and Standard Deviation for Classroom Communication and Interaction Competency

Domain	Arithmetic Mean	Standard Deviation	Level
Classroom Communication and Interaction Competency	2.40	0.54	High

The results indicate that the arithmetic mean for classroom communication and interaction competency is 2.40, with a standard deviation of 0.54, suggesting a high level of application.

Key elements of effective classroom communication include:
✔ Establishing direct and engaging interactions with trainees
✔ Creating a dynamic and interactive learning environment
✔ Using trainees' names to personalize communication
✔ Listening actively and encouraging discussion
✔ Adapting vocal tone and body language to maintain engagement

This result aligns with Slimani (2020), which found that primary school teachers demonstrated strong communication and interaction skills in their classrooms.

12.5. Presentation and Discussion of the General Hypothesis Result

General Hypothesis:

"The degree of application of teaching competencies among vocational training instructors is high from the perspective of trainees."

To test this hypothesis, arithmetic means and standard deviations of respondents' answers for all domains were calculated.

Table 10: Overall Arithmetic Mean and Standard Deviation for Teaching Competencies

Domain	Arithmetic Mean	Standard Deviation	Level

Domain	Arithmetic Mean	Standard Deviation	Level
Lesson Planning	2.39	0.49	High
Lesson Implementation	2.35	0.51	High
Lesson Assessment	2.33	0.55	High
Classroom Communication & Interaction	2.40	0.54	High
Overall Teaching Competencies	**2.36**	**0.47**	**High**

Based on the results in Table 10, it is observed that the arithmetic mean of respondents' answers to the questionnaire items is 2.36, with a standard deviation of 0.47, indicating that the overall teaching competency level among vocational training instructors is high.

This result suggests that instructors demonstrate strong proficiency across all dimensions of teaching competencies, enabling them to perform their duties with efficiency and precision. This high competency level may be attributed to the effectiveness of the pedagogical training program undertaken by most instructors at the National Institute of Specialized Vocational Training in Management – Djebabla Kaddour in Guelma.

Approximately 13 first-rank vocational training instructors participated in this training during the 2023/2024 academic year, undergoing an official certification process at the time of the study. The positive impact of the pedagogical training is evident in practice, explaining the high degree of instructors' mastery of various teaching competencies.

12. Final Conclusion

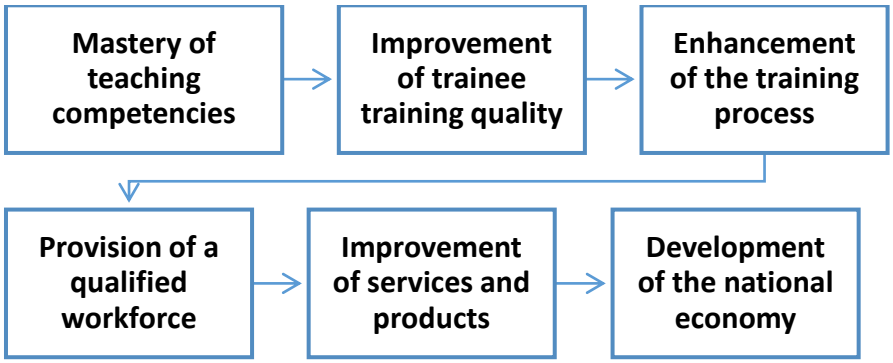
Based on the field study conducted on 233 trainees and their evaluation of vocational training instructors, the findings reveal a key equation:

- A highly competent instructor one possessing advanced teaching skills and abilities to effectively transfer knowledge directly enhances the quality of training received by trainees.
- High-quality training enables trainees to acquire the necessary skills for seamless integration into the labor market, leading to an overall improvement in vocational education and training.
- Enhancements in lesson planning, implementation, assessment, and classroom communication and interaction contribute to a comprehensive and effective training experience for trainees.
- As a direct outcome of quality education and training, the labor market benefits from a well-trained and highly qualified workforce, which enhances overall workforce efficiency and productivity.

Impact on the Economy and Society

Improved workforce skills lead to higher quality products and services in both industrial and service sectors.
Enhanced competitiveness and better service offerings contribute to market growth and economic stability.
A well-trained workforce drives economic development by improving productivity and service quality.
Sustainable development is achieved, fostering continuous societal progress.

Figure (01): The Development of Teaching Competency Mastery Among Vocational Training Instructors



Mastery of teaching competencies
Improvement of trainee training quality
Enhancement of the training process
Provision of a qualified workforce
Improvement of services and products
Development of the national economy

Conclusion

A vocational training instructor's expertise in their field, mastery of teaching competencies, and comprehensive understanding of instructional methods ensure the delivery of effective and tailored training that meets trainees' needs. These competencies encompass both theoretical knowledge and practical skills, enabling instructors to accurately and efficiently transfer technical and vocational expertise.

A well-rounded instructor:
✔ Plans lessons effectively, ensuring structured and goal-oriented training.
✔ Executes lessons skillfully, selecting appropriate teaching methods and resources.
✔ Communicates and interacts efficiently with trainees, guiding them throughout the learning process.
✔ Conducts periodic assessments to monitor progress and ensure that both educational and professional objectives are achieved.

By investing in the continuous development of these teaching competencies, relevant authorities can enhance the quality of vocational education, improve trainees' skill levels, and better align training programs with labor market demands. This, in turn, contributes to trainees' success in their professional careers while narrowing the gap between education and workforce requirements.

Recommendations and Suggestions

Based on the study findings, the following recommendations are proposed:

✔ Conduct similar studies in vocational training and apprenticeship centers to assess the degree of teaching competency mastery among vocational training instructors.

✔ Adopt and reinforce all the competencies identified in this study, as they were rated highly by the study participants.

✔ Carry out survey studies to identify the training needs of vocational training instructors in relation to teaching competencies.

✔ Encourage foundational training programs, whether through initial teacher training or pedagogical mentoring, under the supervision of inspectors, to enhance the essential competencies required for teaching.

✔ Organize training sessions, workshops, and scientific conferences to develop instructors' knowledge, skills, and attitudes, thereby improving the quality of vocational education.

✔ Implement continuous professional development programs post-employment as a priority for enhancing teaching performance.

✔ Conduct regular and periodic assessments to maintain the required performance standards.
✔ Introduce financial and non-financial incentives to reward outstanding instructors in vocational training institutions for their excellence in teaching.

Abstract

The process of reforming public financial management in Algeria raises the question of whether it is possible to overcome the imbalances inherent in the philosophical and reference framework, which has traditionally been grounded in a Weberian bureaucratic legal rationality adapted to the Algerian context. This reform seeks to shift toward a managerial rationality that embraces the concept of New Public Management, in pursuit of greater effectiveness in managing public affairs in general and public finances in particular. The legal framework governing this process underwent an attempt at reform, embodied in the adoption of Organic Law 18-15 concerning public finance laws. This law was passed as part of the implementation of public financial governance based on performance, effectiveness, economic criteria, and the rationalization of public spending.

The challenge of reconciling legal legitimacy with managerial effectiveness in managing public finances in Algeria is closely tied to the nature of the relationships among financial sector actors. This relationship reflects the continued dominance of the executive branch in financial decision-making, weak parliamentary performance, and the lack of effective influence from civil society institutions.

INTRODUCTION:

The reform of public financial management has become a widely accepted priority among politicians, economists, nations, and organizations, given its critical importance in the lives of individuals and societies. Effective management of public funds is increasingly seen as an imperative, driven by the scarcity of resources and rising social demands. As a result, countries are exploring the most effective methods and strategies to

achieve efficient public management and ensure optimal use of public expenditures. This is occurring within a global context where numerous nations are undertaking reforms to their financial systems. These reforms are guided by the concept of financial governance[1], as endorsed by international financial institutions. Financial governance is viewed as a model for effective management, based on results measured through precise indicators.

These indicators are primarily linked to the reform of public management and the transformation of public institutions to operate in ways similar to private companies. This implies that public administration and the state must follow the same rules and mechanisms that govern private enterprises. In doing so, they are subject to market logic, driven by the need for sound, transparent management[2] and a regulatory framework that defines the relationship between citizens and the administration in a more participatory manner, ensuring accountability, efficiency, and effectiveness. This shift is the key justification behind the reform of public financial management, transitioning from a model based on bureaucratic logic—dominant from independence until the early 1990s—to a managerial approach rooted in the principles and practices of New Public Management (NPM)[3].

In the context of public financial management reforms initiated in 2001[4]defining the philosophical and reference framework is essential to understanding the primary objectives of this transformation. The project aims to create a new philosophy of public administration management that prioritizes results, combining two distinct cultures: a democratic one based on the active role of elected representatives and a managerial one that grants greater autonomy to managers, enriched by the experiences of industrialized countries. The central challenge lies in reconciling the requirements of New Public Management with the principles of legal accountability. In other words, how can the law and public management be harmonized to lead the reform of Algeria's public financial management framework?

This paper aims to explore this transition between two fundamentally different approaches, each with its own philosophical and reference frameworks. It will begin by examining the framework of public financial management under the traditional bureaucratic legal model, before delving into the characteristics of the managerial approach[5]. This approach proposes a vision for overcoming the crisis in public financial management, moving towards a model that adopts the concept of governance in public financial management, seeking a balance between legal legitimacy and managerial effectiveness within the Algerian context.

The paper is divided into three main sections:

- Reforming Public Financial Management: Between Law and Public Management
- The Intersection of Legal and Managerial Concepts in the Search for Public Financial Governance in Algeria.
- Towards a New Paradigm in Public Financial Management: Effectiveness and Performance as the Core Framework

1-:REFORMING PUBLIC FINANCIAL MANAGEMENT: BETWEEN LAW AND PUBLIC MANAGEMENT

In light of the prevailing global trend among public administrations to enhance the effectiveness of public actions, several reforms have been implemented to improve public sector performance and the quality of services provided by public institutions. These reforms often involve adopting management approaches that emphasize rational management in public administration, moving away from the bureaucratic legal rationalism that defined the welfare state era. However, this shift has faced significant challenges, mainly in the form of strong resistance to abandoning the bureaucratic legal structure of public administration, even as there has been an attempt to incorporate managerial principles such as efficiency, effectiveness, and performance in managing public affairs. This situation reflects a conflict between legal rationality and new public management, with varying degrees of impact across different countries. Two primary perspectives shape this debate: the North American business management approach and the European public administration perspective, particularly the French model of public service. In this context, Algeria is one of the countries that aligns with the European perspective on public administration, while adding its own unique Algerian approach.

Law and public management represent distinct reference systems. The law focuses on regulating behavior and procedures, while management emphasizes the need for effectiveness, relying on performance and results. Thus," they form separate normative frameworks: one grounded in legal principles with inherent force, and the other in managerial principles, which are more practical, with the validity of their rules depending on the results they produce"[6]. However, the crisis in public management has necessitated the integration of public management principles and practices into the legal frameworks governing public administration, particularly in the area of public financial management

1.1- GOALS AND OBJECTIVES: FROM PUBLIC INTEREST TO THE PURSUIT OF EFFICIENCY

The issue of the relationship between law and public management arises first at the level of goals, and second, at the level of organizational methods, styles, and work practices, with a particular focus on the reality of public financial management in Algeria. This is due to the fact that each country has its own unique characteristics, shaped by its historical, cultural, economic, and political context.

1.1.1.- THE LEGAL FRAMEWORK OF PUBLIC MANAGEMENT

The philosophical and ethical framework for public management, viewed through the lens of legal rationality, is anchored in two foundational concepts[7]:

-The Public Interest: This concept serves as the central pillar around which the traditional model of public administration revolves. Public administration, as an entity distinct from the state, plays a crucial role in mediating and balancing competing social interests. Public management, therefore, is understood as the stewardship of the public interest and the exercise of public authority through governmental institutions.

-Public Service: The second cornerstone of traditional public management refers to the broad spectrum of activities for which the government assumes responsibility, both in terms of performance and oversight. This concept places the state at the core, granting it the authority to determine whether an activity aligns with the criteria for public service. Consequently, the notion of public service must inherently serve the public interest.

In this framework, the law provides legitimacy to administrative actions, forming a foundational equation between public authority, public service, and the public interest. However, this legitimizing mechanism has faced significant challenges, particularly as the distinctions between public and private systems have become more pronounced. The crisis in public management, under the traditional model, has prompted critiques aimed primarily at the law, which historically has been the core of bureaucratic regulation and a key function of state intervention[8]. In this context, "Governance proponents argue that the state is no longer the exclusive source of legal standards, that central regulation and control under the law has become impossible, and that official legitimacy is no longer capable of asserting itself as the sole form of social control and justice.".[9]

1.1.2 THE MANAGERIAL PERSPECTIVE ON PUBLIC FINANCIAL MANAGEMENT

Due to the shortcomings of traditional public financial management, the inability of the legally grounded approach to adapt to the transformations driven by globalization and the declining role of the state has come to the forefront. This has underscored the need to modernize public financial management practices, offering a renewed interpretation of the concept of the public interest. This shift involves incorporating public management principles into the core of public authority and public service, thereby reshaping the philosophical framework of public management from a legal standpoint.

The managerial approach to public financial management proposes the establishment of a new model grounded in the principles of the new political economy. This model critiques the traditional role of the state and its management, advocating for a managerial perspective that treats public procedures similarly to those of private service agencies, subject to identical standards. It critiques the overconcentration of resources within the public sector, champions privatization through outsourcing and market orientation, and emphasizes economic efficiency via cost-benefit analysis[10].. Consequently, this approach represents a comprehensive ideological shift, with new public management at its heart. It seeks to empower managers, aiming to enhance performance and achieve tangible results through an emphasis on concepts such as performance, efficiency, and economic effectiveness

-Performance: The term performance refers to the extent to which objectives are achieved and resources are used efficiently. It also represents the completion of tasks. "Performance is often presented as a cornerstone of managerial discourse, and in economic logic, the concept of performance relates to rationalization, focusing on economic performance in improving the effectiveness of public organizations, relying on evaluation models that adopt a positive relationship between managerial practices and performance indicators, including productivity and quality."[11].

-Effectiveness: The concept of effectiveness in the public sector, within the managerial approach, pertains to the alignment between established objectives and the outcomes attained. It is defined as the relationship between actual results and anticipated outcomes, typically measured by the deviation from the planned targets[12]. Effectiveness thus reflects the extent to which predetermined goals are successfully achieved

-Efficiency: In the managerial approach, efficiency is closely tied to maximizing value while minimizing costs. Public organizations aim to optimize the use of available resources to achieve their objectives, focusing on maximizing outputs, reducing expenses, and enhancing the relationship between inputs and outcomes. "Efficiency refers to the ability to accomplish a task with fewer resources, where an efficient activity is one that incurs the least possible cost."[13].

1.1.3. THE REALITY OF PUBLIC FINANCIAL MANAGEMENT IN ALGERIA

Public financial management in Algeria has historically followed a traditional, legally-driven bureaucratic model, with Law 84-17[14] serving as its foundational reference and guiding philosophy. This framework is rooted in two core principles: first, the public interest and the provision of public services; second, the legal structure of public administration, as outlined in administrative law and the shared system of public services; and third, a bureaucratic rationality and monopolistic system[15].

his approach is exemplified by its reliance on a Weberian legal model, marked by an imbalance of power between the executive and legislative branches in budget management. In this system, the executive exerts dominant control, creating a closed process for the preparation and execution of the state's general budget. The legislature focused on ensuring safeguards to protect public funds from embezzlement, fraud, and waste. However, despite the proliferation of laws and regulations designed to achieve these goals, they have not delivered the intended results[16]. Additionally, the public accounting system suffered from a lack of clarity and transparency, prioritizing procedural correctness over tangible outcomes that would ensure effective public spending[17].

As a result, the system became dominated by a means-oriented logic, focused on securing larger budget allocations without scrutinizing the relevance or substance of the tasks, objectives, or expected outcomes. This disconnect is evident in the budgetary frameworks and the structure of public expenditures, which fail to meet the economic needs necessary for efficient and impactful public financial management. In response to the multifaceted crises of the late 20th century, including challenges in public financial management, Algeria, like many developing nations, sought to implement reforms. Under pressure from international financial institutions, the country adopted a more managerial approach, aiming to merge elements of both traditional and modern frameworks. This shift introduced performance-based concepts, effectiveness, and results, while striving to uphold the principles of public interest and the provision of public services.

2- THE CONVERGENCE OF LEGAL AND MANAGERIAL CONCEPTS IN THE PURSUIT OF PUBLIC FINANCIAL GOVERNANCE IN ALGERIA

Efforts to transition public financial management in Algeria toward a managerial approach[18], moving beyond the traditional bureaucratic legal framework, have raised critical questions regarding the relationship between the principles of New Public Management (NPM) and the foundational reference and philosophical framework of public management, which is grounded in public authority, the public interest, and public service.

2.1- THE EVOLVING REFERENCE AND PHILOSOPHICAL FRAMEWORK OF PUBLIC MANAGEMENT IN ALGERIA

The concept of public authority is inherently linked to the dominance of the state, which stands as the sole source of law, bearing the exclusive responsibility for issuing binding regulations and ensuring compliance through coercive means. The law, in this context, reflects the state's core power, with administrative law governing public management and imbuing it with the essence of public authority[19]. "Public authority has been central to the roles the state plays, aimed at achieving economic growth and political stability. However, the performance of the public sector, marked by its authoritarian nature, has often been underwhelming, particularly following the failure of traditional public service management."[20].

The inability of public institutions to deliver satisfactory services to citizens, coupled with the growing budget deficits needed to finance these services, has highlighted the crisis in public management. This crisis has led to calls for reform, with initiatives focused on overcoming these challenges and driving state-led transformation.[21].

2.1.1 THE CRISIS OF PUBLIC FINANCIAL MANAGEMENT

In an effort to address the ongoing crisis, there have been attempts to transfer principles from private sector management to public administration, reflecting a desire to enhance effectiveness and to base the legitimacy of administrative processes on the measurable success of their outcomes. In this context, the traditional power of the sovereign state is no longer the primary justification for administrative intervention. Instead, the focus has shifted to the ability of public authority to align declared objectives with actual results. While private sector management focuses on productivity and profit, public management aims to achieve performance with the ultimate goal of improving public service delivery.

Public service serves as the third ethical and philosophical reference point upon which public management in Algeria is grounded. It has become the central, unifying principle for all public interventions, as "public management exists solely within the boundaries of public service and for the benefit of public service." [22] In the context of reform policies, particularly following the 1988 changes, the legislator sought to challenge the dominance of the public sector by enacting the Guiding Law for Public Economic Enterprises[23]. This law addressed the debate about whether public services and the public sector could be reconciled within a "socialist state," acknowledging that while there are shared elements, they do not possess identical scope nor function as a unified entity[24].

Moreover, the concept of public service is intricately tied to the realization of the public interest, which justifies its existence and operational framework. It forms a key element of the philosophical and reference framework for public management in Algeria, encompassing all aspects of economic and social activities provided by the state[25]. As such, the concept of public service is dynamic, evolving, and comprehensive, as it reflects the dominant philosophical ideologies of any given era and context. This flexibility in the concept has allowed it to adapt over time and in different locations, including in Algeria[26].

However, this flexibility has not been without criticism. The administration has frequently invoked the public interest to legitimize its actions and secure the support of citizens. Yet, given the persistent failure of public administration to effectively manage public affairs, the very notion of the public interest has come under scrutiny.

2.1.2 FROM LEGAL COMPLIANCE TO THE PURSUIT OF PERFORMANCE AND RESULTS

The failure of public management in Algeria to achieve its intended objectives, due to a variety of factors, prompted the adoption of structural reforms driven by both internal motivations and external pressures from financial institutions. These reforms led to the significant privatization of parts of the public sector, distancing them from the traditional notions of public service and the public interest. The attempt to implement New Public Management (NPM) principles contributed to a shift in the legitimacy of public administration and public financial management, transitioning from a formal, externally derived legitimacy rooted in legal-political frameworks to a legitimacy based on performance outcomes. This new form of legitimacy is defined by the results achieved and the ability of administrators to effectively manage resources in order to optimize the relationship between expenditures and objectives[27].

This shift highlights how the traditional bureaucratic and legal regulatory framework for managing public finances has become outdated, unable to adapt to both internal reforms and external pressures. Core principles such as public interest and public service now face legitimacy challenges, particularly as demands for measurable results take precedence. Public action is increasingly evaluated based on tangible outcomes rather than abstract ideals of service.

Moreover, several criticisms have emerged regarding the concept of public service within the context of the transition to NPM principles. While public service once provided an ethical foundation for governance, it often led to management characterized by idealism and exaggeration. The inefficacy and poor performance of public administration in Algeria revealed that this ideal, promoted during the welfare state era, had become more of a legitimizing myth than a practical framework for governance[28]. As the limitations of this concept have become more apparent, there has been a growing demand for reforms centered on effectiveness, performance, and results. This shift reflects the pressing need to modernize public sector management, incorporating private sector management practices such as contracting, in order to achieve more effective governance and deliver tangible results.

3-TOWARDS A NEW PARADIGM IN PUBLIC FINANCIAL MANAGEMENT: EFFECTIVENESS AND PERFORMANCE AS THE CORE FRAMEWORK

The multidimensional crisis that Algeria faced at the end of the 1980s prompted a search for solutions through a series of internally-driven reforms and numerous externally-imposed measures. The primary objective of these reforms was to restructure the state through more rational public management, focusing on optimizing public spending and improving the mechanisms for allocating public funds. Achieving these goals became a central priority for policymakers, economists, legal experts, and managers across both the public and private sectors, as it was intrinsically linked to the choices of society and the well-being of future generations.

In this context, reforming the legal framework for public financial management became imperative. This reform process included revisiting key laws governing financial and budgetary management[29], such as the 84-17 Framework Law on public finance laws. These laws had become increasingly outdated, failing to reflect the evolving economic, financial, and social realities of the country, as well as the international shifts in public financial management practices.

3.1.1 THE ORGANIC LAW 18-15 ON PUBLIC FINANCE LAWS AS A MECHANISM FOR MODERNIZING PUBLIC MANAGEMENT

The primary objective behind the enactment of Organic Law 18-15[30], concerning public finance laws, was not only to align it with the constitutional framework[31] but also to implement significant reforms in public financial management. This reform is part of a broader global trend aimed at modernizing public finance systems, which began in the Organization for Economic Co-operation and Development (OECD) countries and has since spread worldwide. Key examples of such reforms include France's adoption of the Organic Law on Public Finance (LOLF) in 2001, effective in 2006; Morocco's Regulatory Law 130.13 in 2013, implemented in 2015; and Tunisia's Budgetary Framework Law in 2019[32].

This international context underscores the global momentum toward reforms in public finance management, driven by the need for measurable results and improved performance, with the ultimate goal of ensuring the effectiveness of public spending.

Organic Law No 18-15 outlines the general framework within which public finance laws are structured, along with the processes involved in their preparation, approval, and execution[33]. It sets the management framework for the state's finances and establishes the principles and regulations governing public finance, state accounts, and oversight mechanisms.

Through this law, the legislator sought to bring about a fundamental shift in the approach to public finance laws. Moving away from the previous expenditure-based budgeting approach defined by Law 84-17,

Organic Law 18-15 introduces a focus on performance-based budgeting. The aim is to direct the budget towards achieving specific, measurable outcomes based on clearly defined objectives.

The primary goals of Organic Law 18-15 are

- Reforming the Public Management Framework with a Focus on Results

Improving public financial management, ensuring its effectiveness, and controlling public spending have driven governments worldwide to adopt methods for managing their budgets based on principles commonly used in the private sector, particularly through the use of performance indicators to guide revenues and expenditures.

In this context, Article 2 of Organic Law No 18-15 mandates the adoption of a results-oriented management approach, beginning with clear and specific objectives aligned with the goals of the public interest. These objectives are subject to evaluation[34], ensuring that public expenditure is directly linked to achieving results. This approach shifts public spending from a means-based logic, as outlined in Law 84-17, to an outcome-focused approach. The aim is to enhance the effectiveness and performance of public policies while improving the quality of public services provided to citizens.

This new approach, grounded in an economic perspective, will also reinforce the role of the finance law as a key tool for implementing public policy. It aims to improve alignment between sectoral strategies while maintaining the financial balance of the state. This will be achieved through the adoption of an annual medium-term budget framework, which can be reviewed by the government during the preparation of the finance law each year[35].

This medium-term framework allows for the comparison of financial indicators with the standard benchmarks set out in the government's approved plan, helping to identify areas of success or failure for each program by comparing, measuring, and evaluating results

- Enhancing Transparency in Budgetary Information

Enhancing financial transparency is a fundamental component of effective public finance management and accountability. This focus is increasingly emphasized by international financial institutions, which stress the importance of continuously improving frameworks and guidelines that support financial transparency. In particular, public financial transparency—especially regarding the budget—is intricately linked to the availability, reliability, and accessibility of information related to various types of expenditures and revenues. This includes ensuring the timely dissemination of accurate data to all relevant stakeholders[36].

In this context, Organic Law No 18-15 was introduced to facilitate greater transparency by requiring the provision of various reports and explanatory annexes. These reports enable members of parliament, as representatives of the people, to actively participate in the financial decision-making process, as well as in the monitoring and execution of public finance policies. This requirement is addressed in Articles 72, 75, 76, and 87 of the law.

The law mandates that the government submit several reports at different stages of the annual finance law's preparation, enactment, and execution. This demonstrates the legislator's commitment to making a substantial amount of information accessible to the public and ensuring the involvement of non-governmental actors in the decision-making process. It also reinforces the oversight and accountability of public officials in managing public funds, ensuring that the expected outcomes outlined in the government's action plan are met.

As part of reinforcing the principle of financial transparency, the finance laws themselves govern provisions that directly affect the state's financial resources and obligations[37]. Furthermore, in its first subsection, Organic Law No 18-15 addresses budgetary authorizations in Article 23, specifically stipulating in its third paragraph that any amendments to budget allocations must follow the conditions prescribed by law. This ensures that financial adjustments are made transparently and in strict adherence to the established legal framework.

3.1.2. REFORM GRANTING GREATER MANAGERIAL AUTONOMY WITH ENHANCED PERFORMANCE MONITORING

Organic Law No 18-15 grants manager's greater flexibility in managing public finances by enabling them to make transfers and adjustments to budget allocations within defined procedures. This approach ensures that the intended goals for each program are not fundamentally compromised while maintaining the necessary oversight and accountability.

Article 33 of the law outlines the process for making financial transfers or reallocations during the fiscal year, particularly for adjusting the initial distribution of program allocations. The process is as follows:

- **Transfers within the same ministry or public institution**: These can be made via a decree, based on a joint report from the Minister of Finance and the relevant Minister or public institution.
- **Transfers between ministries or public institutions**: These require presidential decrees, supported by joint reports from the Minister of Finance and the relevant Ministers or public institutions.

The law also mandates that such transfers or reallocations must be communicated to Parliament. Notably, the total amount of transfers or reallocations, carried out through decrees within a given year, cannot exceed 20% of the initial financial allocations for each program[38].

Furthermore, Law 18-15 allows for the carryover of available payment appropriations from one year to the next, but only under exceptional and justified circumstances. This can occur before the end of the supplementary period (by January 31 of the following year). Similarly, payments for investment expenditures in any program can be transferred to the same program, but such transfers cannot exceed 5% of the initial allocation. These transfers are made through a joint decision between the Minister of Finance and the Minister responsible for the concerned sector, as long as they do not disrupt the overall budgetary and financial balance.[39]

While the law provides flexibility in reallocating funds, it also emphasizes that programs must be tied to specific, measurable objectives for which managers are held accountable. These objectives are accompanied by quantitative indicators that assess the effectiveness of public spending and the achievement of these goals.

In line with the law's focus on results-based management, managers are required to report on actual outcomes and are subject to performance monitoring based on clearly defined performance indicators[40]. This ensures that the effectiveness of public spending becomes a central objective, with continuous assessment and reporting on progress[41].

Additionally, the budget settlement law mandates a ministerial performance report, which outlines the circumstances under which programs were executed and evaluates the extent to which their objectives were met. The monitoring and evaluation of these objectives are carried out using relevant performance indicators[42].

To further enhance results-based budget management, the law provides for the option to finance public investment projects through contracting or partnerships with private or public entities, either fully or partially. These arrangements must align with medium-term spending frameworks and sectoral programs, ensuring that such collaborations are consistent with broader fiscal policies[43].

3.3.3. THE EFFECTS OF ADOPTING THE MANAGERIAL APPROACH IN PUBLIC FINANCIAL MANAGEMENT

The adoption of Organic Law No. 18-15 on public finance laws is a key component of the structural reforms initiated by Algeria in 2001. These reforms aim to establish the foundations of good governance and align with constitutional provisions regarding public financial management[44]. They are also designed to keep pace with global transformations, particularly the growing trend toward adopting a results-based approach. Through this law, the framers sought to adapt the roles of stakeholders in public financial management to this new, economically-driven approach, which offers an expanded perspective on public finance and budgetary law.

The managerial approach embedded in the law introduces a new model of financial management, characterized by the following key elements:

- **Program-based management**: Programs are treated as distinct entities to be actively managed.

- **Managerial responsibility**: Similar to the private sector, managers are held accountable for their decisions and actions.
- **Accounting and performance indicators**: These mechanisms align with private sector practices and focus on economic principles such as transparency, efficiency, and accountability.

This model moves beyond traditional financial techniques and embraces an economic vision aimed at improving public financial management by ensuring transparency, efficiency, and accountability. The shift represents a significant change in the role of the state, transitioning from a traditional regulatory and controlling function to a more strategic and participatory role in decision-making. This shift also promotes institutional capacity building and policy evaluation. Ultimately, the goal is to achieve greater efficiency and tangible results in public financial management, moving away from the legalistic and technical approach that has historically been prone to inefficiency and corruption in managing public funds.

2.3.2.1. The Need to Adapt the State's Role

As the public financial management system undergoes reform, the state must adapt to new responsibilities and an evolving role. This shift involves moving from being the primary actor to collaborating with other stakeholders in a more interactive and cooperative environment. This change is driven by the global trend toward adopting New Public Management (NPM) principles and a more managerial approach, significantly shaped by neoliberal theory, which blurs the traditional distinction between the public and private sectors.

In this new paradigm, the state is expected to balance public sector goals with management practices commonly found in the private sector when addressing economic and financial challenges. The state is now treated as an economic actor, subject to the same conditions and principles that govern other entities. This means that performance measures and evaluations are now integral, with the state required to compare its resources to the expected outcomes, ensuring efficiency and effectiveness in public financial management[45].

Thus, the state's intervention in the economy must be economically justified, with a clear social rationale following it. The Organic Financial Law introduces mechanisms to align state interventions with public policies and the responsibilities of public authorities. These include implementing program-based budgeting and holding program managers accountable for their execution[46].

The process of public policy evaluation has gained increasing attention, particularly in light of new perspectives on the state's role in public administration. This shift is notably reflected in the rise of participatory approaches and the growing adoption of results-oriented management practices. In essence, public policies encompass everything "the government does or does not do."[47] The concept first emerged in the United States, driven by the need to justify public expenditure and lend legitimacy to public actions by ensuring their contribution to the development of effective policies, especially in the context of scarce resources.

2.3.2.2 Adoption of Public Policy Evaluation

The adoption of a results-based management approach compels actors in public financial management—operating within a complex and dynamic society—to implement new mechanisms designed and oriented toward achieving tangible outcomes. In this context, we are witnessing a shift in the legal domain toward an evaluation-based approach, which initially emerged as a tool to measure the effectiveness of public policies. This shift is reflected in the development of evaluation methods aimed at assessing not only the impact of legal norms but also their broader social effects[48]. Consequently, evaluation becomes a key instrument in aligning legal frameworks with the principles of good governance, promoting core elements of New Public Management such as transparency, efficiency, performance, and adaptability—all focused on delivering measurable public policy results[49].

Moreover, public policy evaluation enables a more accurate assessment of increasingly complex policies, balancing the drive for results with the imperative to maintain the democratic character of public action. This is achieved by equipping citizens with the information they need to evaluate the functioning of public services and the delivery of public goods.

Organic Law No 18-15 seeks to strengthen Parliament's role in the debate over the Finance Law by enhancing the quality and reliability of information provided by the government, revising the timeline for

drafting finance laws, and modifying the process for voting on budget expenditures. This initiative aligns with the broader transition toward results-based management, moving from an input-focused budget to one centered on outcomes. Such a transformation will directly reshape the presentation of the Finance Law by fostering greater transparency, introducing a new expenditure classification system, updating and simplifying budget documents, and ensuring these are accessible to key financial stakeholders—particularly Parliament and civil society[50].

- **Participation and Informing Public Financial Stakeholders**

The concept of participation refers to the active and meaningful involvement of citizens in all aspects of societal life—economic, social, and political—aimed at advancing the public interest.

In the financial sphere, participation in the budgetary process signifies that citizens hold a political responsibility, which includes the right to shape their collective future by influencing budget allocation decisions and setting priorities for public spending policies that directly impact their lives and living conditions. Given the centrality of the budget process within the broader political governance system, citizen engagement plays a critical role in shaping the content and direction of financial governance[51].

Amid the ongoing crisis of representative democracy, participatory democracy has emerged as a viable alternative to address the legitimacy deficit of traditional institutions. This alternative introduces the principles of citizen involvement and participatory budgeting as mechanisms for reform. It promotes a model of public financial management that places citizens' needs and preferences at the center of government decision-making. International experiences have demonstrated that civil society often possesses a stronger capacity to identify public priorities and a deeper understanding of the trade-offs confronting policymakers. This has led to growing interest in involving civil society in the budgeting process—a dynamic referred to by Leroy Marc as financialdemocracy[52].

However, the introduction and subsequent adoption of Organic Law 18-15, concerning finance laws, occurred without meaningful engagement from key stakeholders—particularly civil society, Parliament, and the political opposition. This lack of a participatory approach risks undermining the law's effectiveness and public acceptance, especially given its broader implications beyond financial regulation, extending to societal choices and the future of upcoming generations. In this regard, citizen participation in the budget process is not merely a procedural formality but a cornerstone for building legitimate and effective financial governance[53].

Ultimately, the successful adoption of results-based management in Algeria's public financial administration remains contingent on the institutionalization of public policy and financial evaluation.

- **Strengthening Parliament's Evaluative Role in Public Policies under Law 18-15**

Parliament plays a crucial role in shaping public policies through legislation, oversight, and advocating for citizen participation in decisions related to public policy. This process includes the monitoring and evaluation of these policies. With the adoption of a results-based management approach by lawmakers, it is essential for Parliament to evolve from merely overseeing public policies to actively evaluating their effectiveness[54].

Organic Law 18-15 captures this shift by introducing a new mechanism for allocating financial resources—through programs that are divided into sub-programs and activities, each with specific objectives and indicators. Consequently, the new Finance Law will make public actions subject to thorough evaluation[55].

Budget systems based on results help institutionalize and expand evaluation frameworks. As Jean-Pierre Camby aptly states, "It's not just about authorizing or approving expenditures and overseeing them; it's about determining the means in relation to the priorities of public action and, ultimately, evaluating them."[56]

This approach is reflected in the legislator's adoption of programs and their sub-components, which are central to the implementation of specific public policies and serve as units for the allocation of financial resources. As such, the Finance Law becomes the foundational tool for evaluating public policies. This evaluation process is reflected in the ministerial performance report, which will be attached annually to the draft budget settlement law[57].

The purpose of public policy evaluation is to enhance the value of the policy outcomes (the results) being assessed (the program) through a rigorous, credible methodology based on reliable indicators[58] In this

regard, the legislator has ensured that program evaluations will be carried out through the assessment of ministerial performance reports, measuring the achievement of expected objectives, as tracked by performance indicators.

The reality of Parliament's role in Algeria highlights challenges, including weak legislative output and limited oversight, particularly in the financial sector. These issues stem from the structure of the parliamentary body and its relationship with other branches of government[59] As a result, Parliament has become more of a chamber for approval, with the executive branch dominating the financial realm due to its superior expertise and capacity compared to the legislative body[60].

- **Enhancing the Evaluative Role of the court of account**

Through Organic Law No 18-15, the legislator sought to establish a framework for public financial management grounded in results-oriented principles[61]. The certification of state accounts aims to promote management accountability by subjecting state accounts to external audits, similar to the certification of corporate accounts. As a result, the Court of Auditors must transition from merely overseeing compliance to evaluating the effectiveness and efficiency of public actions. It will assess performance based on tasks and programs, the primary units for allocating financial resources. In addition, the Court will support and assist Parliament in exercising oversight over the implementation of the Finance Law and extend its advisory role in evaluating public financial matters.

This approach presents both a challenge and a significant opportunity for the Algerian administration, as only a few countries globally subject their public accounts to certification by an external auditing body. Furthermore, the legal framework governing the Algerian Court of Auditors under the current law does not fully align with international standards for supreme audit institutions, particularly those set by the International Organization of Supreme Audit Institutions (INTOSAI) concerning constitutional norms for external oversight[62].

Organic Law No 18-15 ensures the availability of methods through which the court of account can assist Parliament in overseeing state financial affairs or other public financial matters. The President of the National People's Assembly or the President of the Council of the Nation may request the Court to review files of national significance. Additionally, the law mandates the Court to attach two reports to the draft budget settlement law: the first, detailing the results of the Finance Law's implementation for the relevant year, with a particular focus on the management of allocated resources and the execution of programs. The second report addresses the certification of state accounts in line with standards of regularity, integrity, and accuracy, accompanied by a report on the investigations conducted by the Court to fulfill this task[63].

Despite these provisions, the evaluative role of the Court of account has yet to meet its full potential, with actual outcomes falling short of expectations. This is primarily due to the non-binding nature of its opinions and recommendations, which limits their impact on policy and governance[64].

CONCLUSION:

Performance, effectiveness, economy, and resource rationalization are key characteristics that define financial governance. This framework began taking shape in Algeria as part of the broader public financial management reform efforts starting in 2001. After nearly two decades of attempts to enhance efficiency in managing public funds and rationalizing spending—particularly given the limited resources primarily sourced from oil revenues, which are subject to global market fluctuations—the Algerian public administration began to shift.

Historically, public management in Algeria followed a bureaucratic, legally rational system, modeled on Max Weber's approach but adapted to the Algerian context. However, with pressures from globalization and the crisis of the welfare state, the Algerian legislature sought to adopt the concept of New Public Management (NPM), aiming for a more results-oriented approach to public administration, especially in financial management. This shift was reflected in the adoption of Organic Law No. 18-15, which sought to reform the legal framework of public financial management.

Key Developments:

- Organic Law N° 18-15 was introduced to shift the public financial decision-making process from a legalistic to an economic approach, emphasizing results-oriented management.
- The implementation of Law 18-15, however, faces significant challenges. One major issue is the lack of participatory involvement in its drafting, which has undermined its legitimacy and limited its acceptance among key stakeholders. The law was largely shaped in response to the conditionalities of international financial institutions and draws heavily from the French model of financial reform.
- Another challenge in activating Law 18-15 is the difficulty in applying results-oriented management logic, reducing it to a set of techniques that only reinforce the executive's continued dominance over financial decision-making. This, combined with Parliament's inability to reclaim its financial powers and a civil society still driven by rent-seeking behavior, further impedes progress.
- Given that the law's application began only in 2023, it is still too early to assess whether it has successfully reconciled legal legitimacy with managerial effectiveness. However, initial signs suggest that the participatory aspects are lacking, and the executive branch continues to dominate financial decision-making.

Proposed Solutions:

To address these issues and improve the functioning of public financial management, we recommend the following steps:

- **Enhance the Evaluation of Public Policies and Financial Management:** Strengthening the evaluation process will help legitimize public financial management by allowing citizens to understand how public funds are allocated and spent, as well as hold officials accountable. The results-oriented management techniques offer precise data that can improve auditing and performance oversight.
- **Institutionalize Evaluation Processes:** Evaluation should not only serve as an audit to identify flaws but also measure progress toward achieving public policy goals. It should assess whether the intended results of policies—both internal and external—have been met, providing a more comprehensive view of their effectiveness.
- **Good Governance over Petroleum Revenues:** Effective public financial management must prioritize the management of petroleum tax revenues, applying a results-oriented approach that respects the public interest and social justice. This is especially important given the need to protect the rights of future generations, as guaranteed in the constitutional preamble.
- **Balance Legal Legitimacy with Managerial Effectiveness:** The public financial management model should strive to integrate legal legitimacy with managerial effectiveness, balancing legality, equality, and justice with efficiency, performance, and results. The ultimate goal is to serve the public interest.
- **Leverage Advisory Bodies:** Expertise from advisory bodies such as the **Economic and Social Council**, the **Court of account,** and the **Research Center for Applied Development** should be harnessed to support forecasting, evaluation, and policy formulation in public financial management.
- **Mandate Response to Court of account' Reports:** A legal obligation should be imposed on all authorities to respond to the **Court of account** reports within a specified timeframe. Publishing these reports will enhance transparency, and granting judges functional and institutional independence will enable them to perform their duties effectively.
- **Prioritize Education in Public Financial Management:** There is a critical need to give greater emphasis to teaching public financial management and related disciplines. These fields play a vital role in promoting transparency, accountability, and good governance.

Future Steps:

To ensure the success of these recommendations, it is essential to conduct a study analyzing the sub-indicators of financial governance and assess their actual implementation following the adoption of Organic Law No. 18-15. This study should focus on the 2023 Budget Settlement Law, presented to Parliament, as the

primary tool for evaluating whether the expectations outlined in the finance law align with the actual results and the fulfillment of the goals set for the year.

Acknowledgment

The author would like to express sincere gratitude to colleagues from the University of Batna 1 and the Algerian public finance research community for their constructive feedback and insights. Special thanks are also extended to the anonymous reviewers whose valuable comments greatly improved the quality of this manuscript.

Conflict of Interest

The author declares no conflict of interest related to this study.

Keywords Digital Media; Local Communities; Automation; Community Engagement ; Local Journalism.

Abstract
This article reports in detail on the in depth study we did of the very complex and reciprocal relationship between digital media and local communities as we see it in the present time of great automation. As digital media technologies which include players like AI and automated content generators grow to be an integral part of our social structure they in turn greatly transform the models of community interaction, local journalism, and the out reach of civic information. At the same time local communities which have their own unique requirements, cultural specifics and social dynamics play a great role in the development, roll out and growth of digital platforms and automated tools. We did a large scale review of the current and recent past inter disciplinary research from 2019 to 2025 which we used to report on main tech trends in local media ecosystems, we also looked at the double edge of what automation brings in terms of issues and opportunities for social cohesion and economic equity and we looked at the changing roles of human input in a world that is more and more run by algorithms. The results present a transformation which as automation grows so does content personalization, operational efficiency, and civic scalability; at the same time however we see large issues with algorithmic representation, participatory equity, and the digital literacy gap. We end by putting forth what we see as practical and policy issues for the health of local publics in digitalized systems which are also put forth as a call to the research community to develop cross disciplinary approaches which will in turn foster a more inclusive and community centered digital transition.

Introduction:

The community has for a very long time been the base of social organization, a which is a of geographically based proximity, shared identity, and personal relationships. For many generations the health of these communities was supported by what we today term traditional media outlets – local newspapers, radio stations, and community bulletin boards. These institutions served as very important channels for information, identity

reinforcement and public discussion which in turn created a platform for civic life. They did more than just report news they curated a shared story, fostered a great sense of belonging, reported on local power structures which in turn promoted civic accountability and thus wove the social fabric which held communities together. That which may have been imperfect did however provide a stable and recognized structure for local engagement and democracy (Nielsen, 2015).

In the second half of the 20th and the early years of the 21st centuries we saw the introduction of what would become digital media which in turn has very much disrupted what we had known before. The internet put forth new, decentralized, and global scales of communication and information exchange which in turn broke down geographical boundaries and gave way to what at times are interest based associations (Van Dijk, 2020). Social media networks, hyperlocal blogs, and community forums presented what seemed like unlimited chances for connection and information sharing. But also this shift broke up traditional audience groups, challenged the economic models of what was once local media, and also began to change the very nature of community which up until that point was very much place based into a more fluid and networked concept (Bennett & Segerberg, 2012).

At the same time we are seeing the emergence of a second, concurrent disruptive force which is the growth of automation technologies. Out of very fast advances in AI, machine learning, and complex algorithms we are past the stage of these techs being a far off concept and into a present which sees them very much a part of the make up of digital media systems (Susskind, 2020). This intro of automation is very much in the fabric of what runs digital media ecosystems which in turn is very much changing the base elements which support community info flow: in content production which we see in the use of auto journalists and data driven journalism (Carlson, 2015), in content delivery which is via algo based curation on social media and search engines (Gillespie, 2014), and in content which is put out there which we see in very personal info tailored to the individual user (Pariser, 2011). This dual shift – first through the process of digitization and now that of automation – which we see is a very different world for local communities. It calls for a critical study which looks past separate analysis of each of the forces at play to that of their interaction. We must look at the fine and dynamic relationship between digital media and local communities in this age of wide spread automation. Also we see that these techs are not just external instruments but in fact agents of social structure change, also at the same time it is important to note that communities are not passive to this change but rather players that adapt to, push back against, and in fact help to design these technologies (Zuboff, 2019).

This article puts forth to study what is at the heart of our research question: What role do digital media and automation play in the transformation of local communities and in what way do communities play a role in the design of these technologies? We look at this through two main lenses. First we look at how automation is a force which changes the fabric of community – it may bring about new social structures, change how info is shared around, and play a role in the economic growth or decline of a region. Also we look at how community traits, issues which are unique to a place, culture, and also issues of resistance from community members in fact inform the design of which digital tools are used and how they function in practice.

Understanding the complex and dynamic relationship between these issues is more than a theoretical pursuit. It is of great import to many groups which include policy makers that are putting forth AI and digital platform regulations, community leaders which are looking to use tech for social good, and the tech developers which are at work on the next frontiers of what is possible (Pickard, 2020). At great risk we play this out today which is which of these technologies will we see which build up strong, adaptive and inclusive communities or which will we see which put forward existing inequalities, weaken social structures, and break down democracy in our growing digital and automatic world. To in depth look at this complex issue we will present a structured analysis which is what this paper does. We begin by putting forth a wide ranging theoretical framework which includes media ecology, socio technical systems, and political economy perspectives. We then do a in depth review of the present literature to map out the current digital and automated environment. The paper goes on to report on our synthesis method before we present key results of the transformation we see between tech and community. At last we look at the what these results mean which we put out there for use in to shape a sustainable and human centered digital future for local communities.

Theoretical Foundations:

Lenses for Understanding Mutual Influence

To study the intricate relationships between digital media, automation and local communities we have developed a very broad and interdisciplinary theoretical framework. By bringing together these perspectives we are able to present a full picture of how tech systems transform social structures and behaviors and also how communities play a role in that which changes technology.

Media Ecology and Sociotechnical Systems Theory

In the present study we look to Media Ecology Theory which was developed by scholars like Marshall McLuhan and Neil Postman. This theory puts forth that media do not simply and transparently report information but are instead dynamic environments which greatly transform human perception, behavior, cognition and social structure (Couldry & Hepp, 2017). From this point of view digital media platforms (for instance Facebook groups, Nextdoor, local news apps) are not at all the same as tools but are in fact new digital habitats. These habitats change basic elements of community interaction – they shift the speed of communication (instantaneous as opposed to daily print), the scale of audience (global as opposed to local town), and the very make up of collective memory and identity (which is algorithmic as opposed to editorial). Also in to play here is the famous dictum that "the medium is the message" – it is the properties of digital, automated media which in turn shape community life regardless of the specific content they present.

Comprising this is Social Technical Systems Theory (STS) which puts forth the idea of social and technical elements in any complex system as inextricably linked. We see in STS a rejection of technological determinism which presents tech change and social change as a unitary whole. This is a key perspective for looking at the development of digital media and automation which we tend to think of as a pure technical bottom up process. Instead what we have is a dynamic process of negotiation. The design of a social media algorithm for local news for example is a product of social values, economic models and programmer bias (social shaping of tech) which in turn goes on to change social interaction, news consumption and community issues (tech shaping of society) (Bucher, 2018). For a full picture of what is going on we must look at the full human and machine elements.

Social Influence and Community Media Theories

At a detailed level Social Influence Theory (which includes Bandura's social cognitive theory and theories of diffusion of innovations) is key to the explanation of the micro processes of technology adoption within communities. Individuals and out of groups do not adopt new digital technologies in a void. Their adoption is very much a result of what they see as the norm, the actions of opinion leaders in their community, and the which which early adopters in their social network are using the technology (Jenkins et al., 2009). This theory also accounts for the quick often viral take off of platforms like WhatsApp for neighborhood watch groups or Facebook for local event organization which is in great part due to community leaders and early users which play a large role in the validation and integration of the technology into the fabric of community life.

Also in that which Community Media Theory presents we have a normative framework for the discussion of media's role in local life. This theory brings to light the important role played by media that is run by, for and within a specific community. It's base values are participation, access and the promotion of local identity and democratic discussion. This theoretical stand point puts forth a critical measure with which to gauge the effect of digital platforms which are automated and commercial. It brings up fundamental questions like does that which is run by algorithms truly serve local issues or do they instead promote what may divide? Can we use automation to support the cause of community media or does it in fact centralize control away from the local level? This theory also brings to the fore the special value of media which is answerable to its community (Lindgren, 2017).

Economic and Labor Perspectives on Automation

To study the great material impact of automation economic theories are a must. We look at the issue of Technological Unemployment and also include Political Economy which in turn looks at how automation plays out in local economies, restructures employment and in that which we may term the base of community life. Automation brings in the promise of greater efficiency but also we see it's a cause of job loss, task simplification and wage inequality which in particular play out in routine and low skill jobs present in local economies

(example – in local government admin, retail and even elements of journalism). This economic instability which is a result breaks down community stability.

These theories also present a view into adaptive strategies. The idea of Just Transition puts forth that we put in place policies which support workers and communities left behind by tech change via retraining programs, social safety nets, and also we look at new economic models like platform cooperativism (Pickard, 2020). Also we look at the issue of Digital Inclusion which goes beyond just access to tech to also include the elements of skill, affordability and relevant content which together will enable full and equitable participation in the digital space (Van Dijk, 2020). Also this approach we put forward is to see how tech is playing a role in either increasing or decreasing existing socio economic inequalities within and between local communities.

Literature Review:

Mapping the Digital and Automated Landscape

Existing research presents a full though at times broken picture of how digital media and automation are changing community life. This review brings that together which looks at communication, information ecology, and socio-economic structures.

The Dual Role of Digital Media in Community Engagement

Over the past decade research has reported that which we see is a double edge role of digital media. On the hand we see that platforms like Facebook Groups, Nextdoor, and dedicated community apps have become very integral to what we do in terms of community outreach and engagement (Bennett & Segerberg, 2012). They put out info very locally, see and respond to issues almost in real time which in turn prompts large scale action (for instance a local clean up, or a fund raise for a family in crisis) also we see the formation of interest based sub communities which break out of physical boundaries. Also from the likes of the Pew Research Center we see that these tools play a large role in what they term as the constant awareness of goings on in our communities, in effect they are strengthening what we may call weak ties and at the same time are a layer of connection we didn't have before.

On the other hand what we see is that this digital engagement exists with and at times does in fact worsen the want for in depth and genuine connection. Also we see that although Americans are growing to get their news from digital sources what is very much still in demand is that which which fosters local tie and accountability (Nielsen, 2015). This brings out what is a short coming of many digital platforms which while very good at what they do in terms of information out put and weak tie connection are in fact poor at the issue of in depth discussion which is a requirement for the solution of complex local issues. Also in to the hands of private companies we are putting the control of community communication which by and large have as there main accountability to their shareholders and not to the citizens (Zuboff, 2019).

The Transformation and Crisis of Local Journalism

Local news is at the core of what makes up a community's info environment and also is the most affected institutions. Digital technologies have brought about the decline of the traditional advertising based revenue models which in turn has led to mass lay-offs, newspaper shut downs and the growth of what we see as news deserts – communities which do not have a dedicated local news source (Anderson, Bell, & Shirky, 2015). This crisis also has very large scale democratic implications which include reduced civic participation, increase in corruption, and we see a greater political polarization.

In response we see a great deal of innovation in local journalism. Digital native non profit news rooms (for example The Texas Tribune) have appeared which are running on grants and member donations. Legacy players are putting out digital subscriptions, podcasts and email newsletters. Also they are turning to technology for solutions which in turn is a path to survival. This includes in depth use of data journalism to break local stories, use of social media for audience growth and also as we will discuss integrate automation into news production (Lewis & Westlund, 2015).

Automation's Impact on Work and Information Production

The issue of automation in the workforce is a key focus of research which in turn has large scale economic implications for communities. From the research done by groups like McKinsey and the Brookings Institution we see that although automation does boost productivity, what is also true is that these benefits do not fall equally on all (Susskind, 2020). It also tends to take out routine jobs, at the same time which we see is to a large degree responsible for wage stagnation and income inequality. What we are seeing is a 'hollow out' of the middle of the labor market which in turn puts pressure on community resources and also increases social stratification.

In the field of local journalism we are seeing the adoption of automation to address what are very acute resource issues. Tools such as Automated Insights' Wordsmith and United Robots' software are used to produce large amounts of data driven content which we see in real estate transactions, local sports results, and crime reports (Carlson, 2015). This "robot journalism" is a complement to human reporters which in turn free them from routine tasks to do in depth investigative and analysis work. It also helps to expand coverage which in turn maintains audience engagement. From case studies in Scandinavian countries which have high adoption rates we are seeing very promising results in terms of news output.

However in the literature we see that which puts forth great issues. Automated systems are a reflection of the data they are trained on. They do what they are trained to do which is to repeat and amplify present biases and at the same time which may ignore niche or minority reports that do not have large representation in the training data (Gillespie, 2014). This in turn creates a risk of a new "algorithmic divide" which sees some community issues and groups left out in the automated news report. Also we are still at the stage which we are trying to work out the ethics of automated content generation – transparency, accountability for errors, and the issue of use which may include the spread of misinfo (Graves, 2018).

Methodology:

A Systematic Synthesis-Driven Approach

Given the large scale and multidisciplinary scope of the research question this study uses a systematic, theory based literature review approach. We put forth this approach which is best for the synthesis of present knowledge, to also which is to say we identify what is agreed upon and what is not in the literature and in which we present a novel conceptual framework that which puts forth the results of that analysis.

Data Collection and Selection Criteria

The research did a in depth and iterative review of sources put out between 2019 and 2025 which we did to get the latest data. We looked at four main types of sources :

1- Academic Databases: In Scopus, Web of Science, and Google Scholar we found peer reviewed articles which we located via keyword combinations of ("automation" or "AI") and ("local journalism" or "local news"), ("digital media") and ("community engagement") and also ("algorithmic curation") and ("local community").

2- Industry and Policy Reports: Also we looked at grey literature from top groups like Deloitte, McKinsey Global Institute, Pew Research Center, and the Knight Foundation which gave us info on trends, adoption rates and economic impact.

3- Organizational Resources: We looked at what the Local Media Association, the Center for Community Media, and the International Center for Journalists had to say which covered practical applications and ground level challenges.

4- Case Studies: We did in depth qualitative analysis of certain put forth by which we look at automated community management platforms (for instance moderation tools on large community forums) and local media automation initiatives in particular in Scandinavia (which includes MittMedia in Sweden) and North America.

Data Analysis Framework

The we conducted a qualitative content analysis which included:

- Coding: We did thematic coding of the literature based on our prior theoretical frameworks (we used codes for "algorithmic bias", "digital literacy initiatives", "revenue model innovation", "social cohesion").
- Synthesis: We very carefully put together results from very diverse sources to bring out over arching themes, which reports what we found to be true time and again as well as the big issues we came across.
- Framework Development: We put together these themes to present a which is a whole new model that puts forth the what how digital media, automation and communities play off each other and what are the results of that play.

It is important to note we did not collect any new primary empirical data for this study. Our contribution is in taking existing research and in a novel way we put it together and we gave a full picture of a very complex and evolving issue.

Results:

In a review of present day research we see that which is put forth is a world of what may be termed as in process and continuous change between digital media, automation, and local communities. This is not a one way street but a very complex set of issues which see in play for example between efficiency and equity, and also between scalability and authentic representation. We note 3 main thematics which contain in them these in between and at time conflicting issues.

1. The Efficiency-Scalability-Personalization Triad: New Capabilities and New Vulnerabilities

Automation technologies have infused local digital ecosystems with what was once beyond imagination, mainly in terms of efficiency, scale, and relevance.

- **As a Prerequisite for Success, Not a Nice To Have:**
Automation is what local institutions that are under very tight resources use as a primary tool. In which we see that in issue of economic pressure to which local newsrooms are at the moment of breaking point, use of AI within the form of NLG software is introduced. This technology is used to produce large amounts of data based content that reports out on things like which high school scored in what game this past weekend, which house sold for what price in that neighborhood, and what was the report on crime in our area for the week (Carlson, 2015). For example we see in the case of Scandinavian regional newspapers which have implemented reporting automation what we that they report an increase of 20% in the reporters' time which in turn they put into in depth investigative reports, nuanced feature stories and community engagement – which are very much a human element and require analysis and empathy. Also in local government we are seeing more and more use of chatbots on community association websites in regard to very regular citizen requests for info on trash collection, permit applications, or event registration. This is not just a way to cut costs but a strategic shift to run a base level of public service and info out put in a very resource starved environment which in turn allows basic civic functions to continue to operate with less human resources.

- **Unprecedented Scalability of Community Management:**

Digital platforms that which run on automated content moderation tools, sentiment analysis algorithms, and automatic membership management systems are now able to support community growth to a size and diversity which would be impossible through human effort alone (Bucher, 2018). A single community manager with these tools at her disposal is able to run a network of thousands of members which she does so by using the auto systems to report out on toxic language, to identify issues which are flaring up and to handle the routine admin tasks. This scale which we see is enabling the formation and also the maintenance of very large, distributed "communities of interest" which break free of physical geography, for instance national groups for owners of a certain breed of dog or global networks for professionals in a very niche field. But this scale also brings a trade off in that which we lose out on the in depth local knowledge a human moderator brings. The automation does a great job at managing scale but can fall short in the quality, context which goes into local community norms and in the interpersonal relationships.

- **Hyper-Personalization and the "Local Filter Bubble":**

AI designed recommendation algorithms do very well at personalizing what each individual gets out of digital communities (Pariser, 2011). What a member sees in terms of local news, which social groups to join, what events are put forward to them is very much a very tailored experience – we see news from a certain neighborhood, updates from your child's school, info on local zoning which affects your street. This very fine tuned personalization increases the relevance of the info right away and in turn engenders greater user engagement in a digital space that is made just for you. Also it creates what we may call a "local filter bubble" a personal information world that may in fact reduce what is put in front of a citizen which is the greater issues of the wider community. While it does increase that which which a like minded group affiliate with each other, at the same time it may also play a role in breaking down the common pool of info that is required to address wide scale community issues and in turn in the development of a common community identity (Nechushtai & Lewis, 2019).

2. The Challenges of Equity, Representation, and Human Agency: The Perils of Algorithmic Mediation

The push for efficiency, scale, and personalization presents great risks which in turn threaten the core principles of equitable representation and democratic accountability in local communities.

- **Algorithmic Oversight and Systemic Bias:**

Across large scale of studies we see that which we put forward in automation of efficiency brings with it inborn issues of bias and misrepresentation (Gillespie, 2014). We see that which which automated content moderation systems do of which they are trained on large general sets do in fact often fail to understand local context, dialect or satire. This in turn causes the mis identification and removal of what is in fact local discourse as toxic content which in turn goes after minority groups and activists whose language may not play by the main stream rules. Also that which news generating algorithms are only as objective as what they are given to feed them. If historical data on crime or event coverage which is in fact biased against certain neighborhoods is what is put in, the algorithm will not only reproduce but also amplify this issue which in turn does the marginalization of already underserved communities (Nechushtai & Lewis, 2019). Also the algorithms design to put out what gets the most user engagement does so which puts forward sensational, divisive or very emotional content which in turn skews the public digital sphere away from the serious fact based discussion and into conflict thus increasing the polarization of the community.

- **The Digital Literacy Imperative and the New Frontier of Inequality:**

The growth of digital automation has brought about a very steep and diverse learning curve for what it takes to be an active member of the digital civic space (Van Dijk, 2020). We see that simple access to the internet is no longer enough. What we are instead is a requirement for advanced digital literacy skills which in turn is a pre-requisite to use of algorithmic news feeds, to tell the difference between machine generated content and human journalism, to get to terms with complex issues of data privacy, and to think critically about the large volume of info we are presented with. Also this has brought up a new form of inequality – what we are seeing is a digital fluency gap. Seniors, low income groups and those with less formal education are at great risk of being left out – not just as info consumers but as players in the digital civic space (Jenkins et al., 2009). Thus, their voices and issues may go unrepresented in what we may call digital town squares which in turn plays into and increases the social economic gaps within communities.

- **Erosion of Traditional Accountability and the Devaluation of Local Knowledge:**

The integration of automation is blurring what used to be clear lines of accountability which at its core changes the character of labor in community information ecosystems (Graves, 2018). When an automated system gets out with an inaccurate story or a chatbot gives a citizen wrong info a key question we are left with is which is at issue – the software developer, the media company which put it out, or the public institution which bought it? This accountability gap can erode public trust. Also the transition of newsroom labor from field reporting to data management, algorithm monitoring and tech maintenance is a large scale issue. It may in fact erode what we may call "institutional knowledge" – that in depth knowledge of a community's history, power structures and unspoken rules which is held by the senior local journalists (Anderson, Bell, & Shirky, 2015). That which is the base of in depth and trusted journalism and effective community management which at present algorithms are not able to reproduce. The risk is we see a move towards a more technical efficiency but less context rich information environment.

3. Community-Led Adaptation and Resilience: Agency in the Automated Age

In response to these great challenges the literature reports that local communities do not passively accept technological change but are in fact very much a part of that change which they adapt to and which they in turn shape – also they develop innovative practices which restore their role.

- **Digital Literacy Coalitions as a Response:** We see that there is a digital fluency gap which has in turn produced from the bottom up responses to build up community based resources. Public libraries, community centers, and non profit organizations are at the fore front of digital literacy training (Jenkins et al., 2009). Also what we are seeing is that these initiatives go beyond the basic computer skills to include "algorithmic literacy" which is the study of how news feeds and recommendation systems work also we see the introduction of critical thinking skills which in turn help citizens to identify automated content and misinformation. These coalitions are a very important civic effort to see that the community as a whole is able to play a full role in the new digital public square.

- **Support for Alternative, Community-Centric Models:**

  A large trend at present is the increase in support for alternative economic and governance models which put out of play the big tech platforms' metrics of success and instead which account for local wants (Pickard, 2020). This includes the growth of member based non profit local news organizations (for instance City Bureau in Chicago, The Texas Tribune) which put forward civic value above all else. Also we see greater interest in platform cooperativism – which is when the digital community platform is run and governed by its members – thus the rules of the road and algorithmic principles are set by the community's themselves instead of by remote corporate entities (Lindgren, 2017).

- **Strategic Partnerships for Sustainable Innovation:**

  Finally, we see a trend of local media players and community groups which have begun to form strategic alliances to pool resources and expertise. These collaborations which may include local universities (for research and technical development), tech start ups (for tool development and implementation) and community foundations (for funding and local legitimacy) (Lewis & Westlund, 2015). These hybrid models they put in place create a more sustainable and resilient ecosystem for local info. For example a local news room may team up with a university's computer science dept to develop a custom ethically audited algorithm for which curates local event news thus the tech is tailored to the community's specific values and needs as opposed to a one size fits all commercial product. This is a practical solution which also brings in the benefits of automation while at the same time keeping development and deployment in a local context and under human supervision.

Discussion

This study reports we see a very complex and at the same time very much a part of each other relationship between digital media, automation, and local communities. That which we see is not of a linear cause and effect but of a continuous feedback loop in which technical systems put forth new terms for social interaction and info flow and at the same time communities which are responsive, resistant, and also shapers of these very technologies. This plays out as a very fine line we must walk between efficiency and equity, scalability and true representation, personalization and public discourse which determines the future of local community life in the digital age.

The key issue we face is to put in place a framework which takes in the great benefits of what we get from the efficiency-scalability-personalization trio while at the same time very carefully dealing with its issues. We must go beyond a pure technical approach; we require a socio technical solution which puts social values into tech design (Bucher, 2018). This begins with a very strong base in human centered design which sees algorithms as aids to human decision making not replacements. In practice this means we see to it that there is meaningful human input – what some term a "human in the loop" system – which puts forward issues for final human review by automated content moderation and which has algorithmic news generation supported by in depth reporting and ethical editing. Also this approach protects the in depth understanding, context awareness and

moral responsibility which is the base of community trust and democratic discussion. Also we must have transparency which is non negotiable in this issue of accountabiliity; users must be made aware of how algorithmic systems put together their info environment and when they are in fact interacting with auto generated content (Graves, 2018).

However, it is true that tech design by itself is not enough. In the coming age of automation what we see is that which which local communities will sustain themselves out of will be a balance between what we put into digital tools and also into social infrastructure (Van Dijk, 2020). This is a two pronged approach of which we build digital literacy and at the same time we strengthen physical institutions. We must develop what I will term advanced digital fluency in our citizens which includes the ability to critically use algorithmic feeds, to sort through automated content and to protect privacy (Jenkins et al., 2009). Also at the same time we must put forward that while libraries, community centers, and local press may be of the past they are in fact the present and the future of community identity. These institutions serve as that which is trusted and human curated which in turn foster serendipity and face to face connection that algorithms do not. They are the cure to the breaking up and isolation that automated systems may cause.

In the base of these efforts should be a radical rethinking of economic models which in turn will ensure that the benefits of automation are equitably distributed and do not worsen present inequalities (Pickard, 2020). We are at a point which large tech players' power and revenue is concentrated in the hands of a few which in turn requires we think up innovative policy and community based solutions. This may include in to negotiating community benefit agreements which see tech companies put a part of their profit into the local digital infrastructure which they use, putting forward public funding models and tax breaks for independent local journalism, and also pushing for platform cooperativism which is a model in which digital community platforms are run and governed by their users (Lindgren, 2017). These models put forward that governance and algorithmic issues should support community values as opposed to profit extraction.

In the end which is what this all comes down to we have a great need for strong policy and governance responses. Self regulation has0 out proved to be insufficient for the size of the issue at hand (Zuboff, 2019). It is time for legislators and regulators to take action in the mandating of algorithmic transparency which in turn will enable independent audit to identify and put a stop to bias. Also required are antitrust measures which will break up big tech's dominant position in the market and in their wake foster the growth of alternative community based models. What we as a policy must aim for is the development of what we may term a digital public sphere which we will know is successful by its impact on issues like informed discussion, civic participation, and social cohesion not by the shallowness of user engagement metrics (Vredenburg & Spry, 2020). We will see this through with thought out design, in put from into social infrastructure, creative economic models, and bold policy – only then will we be able to guide our way through to a world in which digital automation is a force that which does good by our local communities' health and diversity, instead of damage.

Conclusion:

The digital transformation of our age is seeing local communities and the media which serves them influence each other in new ways – it is a defining process of our time that is very much in the process of redefining how we interact socially, do business, and participate in civic affairs. AI and automation put at our disposal very powerful tools to improve the scale, scope and impact of local info exchange (Susskind, 2020). But also they are not magic solutions; they are rather what we put into them which in turn will play out existing issues of intent and inequality.

We will not achieve a sustainable future for local communities in a digital age through tech alone. What is required is a whole scale, integrated approach which puts together tech innovation with effective, people centered governance, wide scale and inclusive digital education, and design that is empathetic, equitable and which is accountable to the local community (Dutton, 2009). The health of our local communities is in our hands as we navigate this co evolutionary process which we are a part of, and which we must steer with care to see that the digital spaces we create are not just about connection but also about true belonging, not just the flow of info but also that of understanding and not just growth in efficiency but in also in terms of resilience and democracy.

Future Research should focus on longitudinal studies which track these changes over time, also we should see to it that we develop and evaluate adaptive policy frameworks, and very much so we put in place participatory design methods which include community members in the development of the technologies which are to serve them (Tandoc, 2019). The issue is not that automation will shape our communities but that we will together shape automation to build the communities we wish to live in.

Keywords Algeria, SMEs, non-oil exports, trade diversification, regression analysis, export performance, hydrocarbon dependency.

Abstract
The Small and Medium Entreprises in Algeria and their contribution to the country's non-oil exports is the major focus of this study from 2000 to 2023 by means of descriptive trade analysis and a log-linear regression model. Data were based on official sources provided by the Central Bank of Algeria in order to calculate trade balance trends, analyze export composition, and evaluate the percentage of non-hydrocarbon exports before estimating the effect of SME growth on export performance. The results show that SMEs have a positive and statistically significant impact, with 47.5% being the share of explained variation of non-oil exports. However, export growth has remained more volatile than SME growth, showing the existence of structural constrictions and dependence on external market conditions. The findings stress that enhancing SME competitiveness and innovativeness and integrating them into global value chains through policy intervention is pertinent so that the diversification of exports away from hydrocarbon dependency is actually realized.

Introduction

Due to their importance in promoting innovation in the economy, creating jobs, and developing inclusive growth, small and medium-sized enterprises (SMEs) are today the nucleus of any country's economic development strategy. SMEs are a majority source of enterprises all over the world, and it is widely accepted that they represent significant engines of productivity and competitiveness, particularly in emerging and developing economies. They

ensure export diversification and, therefore, lower the exposure of economies to fluctuations in commodity prices-the challenge many countries face due to their resource dependency.

Over the last couple of decades, there has been growing interest among scholars and policy-makers on the relationship between SMEs and export growth. The sparse empirical evidence collected over the years from various parts of the world shows that SMEs can enhance their export performance significantly when accompanied by other factors such as adequate access to finance, trade facilitation measures, and incentives for innovation. Nevertheless, SMEs continue to be excluded from global trade mainly because of structural and institutional constraints ranging from regulatory burden, high transaction costs, and lack of knowledge of international markets.

For hydrocarbon-dependent economies like Algeria, exporting beyond oil and gas is not merely an aspirational objective but a necessity in the strategic sense. Hydrocarbons constitute a proportionately overwhelming share of the revenue earned from exports by Algeria, exposing the country to a heavy dependence on international fluctuations of energy prices. In 2009 and 2014–2015, periods of instability in the oil market highlighted the structural fragility of this dependency, usually leading to trade deficits and fiscal imbalances. Non-oil exports have become a priority of policy in that context, and SMEs are ostensibly the possible engines of such diversification.

Although Algeria has witnessed steady growth in the number of SMEs over the past two decades, it remains unclear whether this expansion has translated into substantial gains in non-hydrocarbon exports. While policy discourse consistently highlights SMEs as key actors in promoting export diversification, empirical research that quantifies their impact on non-oil export performance in the Algerian context is scarce. Most existing studies focus on broader SME economic contributions or rely on cross-country comparisons, leaving a gap in country-specific, regression-based analyses. The volatility observed in Algeria's non-oil export performance, contrasted with the relatively stable growth of SMEs, raises important questions about the strength and consistency of the relationship between the two, questions that this study addresses by applying a regression analysis approach to national time-series data covering the period 2000–2023.

Literature Review

Small and Medium Enterprises (SMEs) are widely acknowledged as engines of economic growth, job creation, and innovation across both developed and developing economies. Globally, they account for over 90% of firms, employ more than half of the global workforce, and contribute substantially to GDP (Morales Pedraza, 2021; Vulić, 2021; Koguashvili & Koridze, 2022). Their participation in international trade, although proportionally lower than that of large enterprises, has been increasingly recognized as a driver of export diversification and competitiveness (Savlovschi & Robu, 2011; Lopez Gonzalez & Sorescu, 2019). For instance, WTO (2021) estimates that SMEs represent 33% of exports in developed countries but only 18% in developing ones, reflecting structural and institutional disparities.

In advanced economies, several studies provide insights into the export potential of SMEs. Batrancea (2022) finds that online and extra-EU trade significantly influence SME-driven growth in the European Union, while Petrunenko et al. (2022) demonstrate a strong correlation between SME turnover and GDP in Eastern Europe. Małecka (2017) emphasizes that EU-based SMEs benefit from state support, long-term cooperation opportunities, and product demand in foreign markets, factors that enhance their stability in international trade. In the UK, Gkypali, Love, and Roper (2021) identify both "learning-to-export" and "learning-by-exporting" effects, highlighting the role of innovation in building export capability. Similarly, Wilkinson and Brouthers (2006) show that targeted export promotion, such as trade shows and agent identification, can improve SME satisfaction with export performance.

In developing and emerging economies, research presents a more complex picture. Lê (2022) reports that Vietnamese SMEs benefit from sustained export participation, although the study does not distinguish between oil and non-oil exports. In China, Zhang and Xia (2014) highlight the dominant role of SMEs, 98% of industrial enterprises, in GDP and employment generation, while stressing their contribution to absorbing labor market entrants. In Nigeria, Oluremi and Maku (2024) find that SME trade, bank loans, and labor force participation positively affect economic growth, though patent applications show a negative relationship. In Jordan, Abuhatab (2023) observes that despite supportive policies, MSMEs have had an insignificant impact on GDP per capita growth, due to persistent structural barriers.

Some studies directly address SME contributions to non-oil exports. Qobuljon (2024) argues that SMEs enhance export diversity by targeting niche markets and integrating into global value chains, but require government support to overcome regulatory and financial constraints. Similar findings emerge in Egypt, where El-Said, Al-Said, and Zaki (2015) show that bank access boosts both the likelihood and diversification of SME exports. In Asia, Jinjarak, Mutuc, and Wignaraja (2016) find that financial access is critical for SME internationalization, while Duval and Utoktham (2014) identify customs efficiency, quality certification, and trade finance as key enablers for participation in production networks.

Beyond macro-level impacts, micro-level determinants are equally significant. Safari and Saleh (2020) apply a resource-based view to show that innovation, networks, and managerial readiness are central to export success. Revindo, Gan, and Hambali (2024) stress the importance of post-export support to sustain growth, while Khattak et al. (2011) and Stouraitis et al. (2017) reveal that internal managerial barriers, such as lack of export knowledge, are often more constraining than external factors. Juminawati et al. (2021) further highlight the role of SMEs in boosting regional economies by creating business opportunities and introducing innovative products.

From a methodological standpoint, regression-based analyses provide quantifiable evidence of SME impacts. Piratheesan (2019) shows that SMEs account for 62% of regional development in Sri Lanka, suggesting potential for export-led growth. Akighir and Joseph (2019) find that non-oil exports positively influence GDP in selected African countries, although the effect is statistically insignificant when SMEs are not isolated. Muthuraman (2020) conceptualizes SMEs as pivotal to integrating local industries into global supply chains, thus enhancing export potential.

Several reviews consolidate the current knowledge base. Calheiros-Lobo et al. (2023) identify gaps in longitudinal research, theory integration, and niche market strategies. WTO (2021) and Savlovschi & Robu (2011) emphasize the need for better data collection and policy alignment to boost SME competitiveness. Together, these studies point to finance, innovation capacity, trade facilitation, and institutional support as recurring themes in SME export performance.

Despite this breadth of research, the literature on SMEs and non-oil exports remains fragmented, particularly in the Algerian or North African context. Most studies are either cross-country or sector-specific, limiting their direct applicability to Algeria. The present study addresses this gap by adopting a country-specific approach using official Algerian trade and SME data over a 21-year period. By combining descriptive trade analysis with regression techniques, it seeks to quantify SMEs' contribution to non-oil exports, offering both empirical evidence and policy-relevant insights.

Methods and Tools

This study adopts a quantitative research design to examine the contribution of Small and Medium-sized Enterprises (SMEs) to Algeria's non-oil exports over the period 2002–2023. The methodological process follows a sequential approach, beginning with descriptive trade analysis and culminating in econometric modeling to quantify the relationship between SMEs and non-oil export performance.

All statistical data were obtained from the official publications of the Central Bank of Algeria, ensuring both accuracy and national relevance. The analysis begins with an assessment of Algeria's trade balance dynamics. Exports and imports are reported annually to calculate the trade coverage ratio, defined as total exports to total imports, and this is an important indicator upon which the country can find the ability to finance imports with export revenues. This indicator gives some insight into structural imbalances of trade as well as the sustainability of external accounts.

The second step is to break Algeria's structure of exports into hydrocarbon and non-hydrocarbon components. This way, the annual share of non-oil exports in total exports will be calculated, thus allowing an evaluation of the extent of diversification on exports and reduction of dependence on hydrocarbon revenues. The trend of non-oil exports from 2002 to 2023 is explored in detail, with specific attention being paid to the effects from the fluctuations of the oil market and economic policy reforms.

On the econometric phase, the study uses a log-linear regression model to analyze the impact of SMEs on non-oil exports. The dependent variable is the natural logarithm of non-oil exports (in billion USD), while the independent variable is the natural logarithm of the number of SMEs. This functional form is selected to stabilize the variance, provide elasticity interpretations, and describe proportionality relations. The model is estimated using the Ordinary Least Squares (OLS) method with the validation of models being tested through normal diagnostic statistics like R-square, adjusted R-square, t-tests, p-values, etc.

Data processing, visualization, and statistical estimations were performed using Microsoft Excel and SPSS software. Both of these applications enable time series management, regression computations, and the generation of graphical outputs for aiding the interpretation of the empirical results.

Trade Dynamics and the SME Contribution to Non-Hydrocarbon Exports in Algeria (2000–2023)

Here are three closely interlinked areas of analysis being presented. First is an analysis of the trade balances of Algeria from 2000 up to 2023, highlighting major fluctuations and the relevant economic factors behind them. The second area is focusing on non-hydrocarbon export performance in the same period with an assessment of their importance in national economic diversification. An empirical assessment of SME contributions to the development and expansion of these exports from 2002 to 2023 is the third subject matter being discussed. All these analyses give a wholesome view of Algeria's trade, diversification initiatives, and SMEs' strategic involvement in the country's export-formation landscape.

1. The Algerian Trade Balance: Trends and Developments (2000–2023)

As far as Section One is concerned, it will focus much on the analysis of changes in Algeria's trade balances over the period of study, looking at important trends, transformations, and determinants. This will also study the changes in global energy prices, the changes in import-export volumes, and impact trade policies on how they affect the balance of payments. That path eventually renders an account of how structured these elements are. Therefore, that would illuminate the defining characteristics of Algeria's external trade as well as its sensitivity to outside economic shocks at some earlier stage.

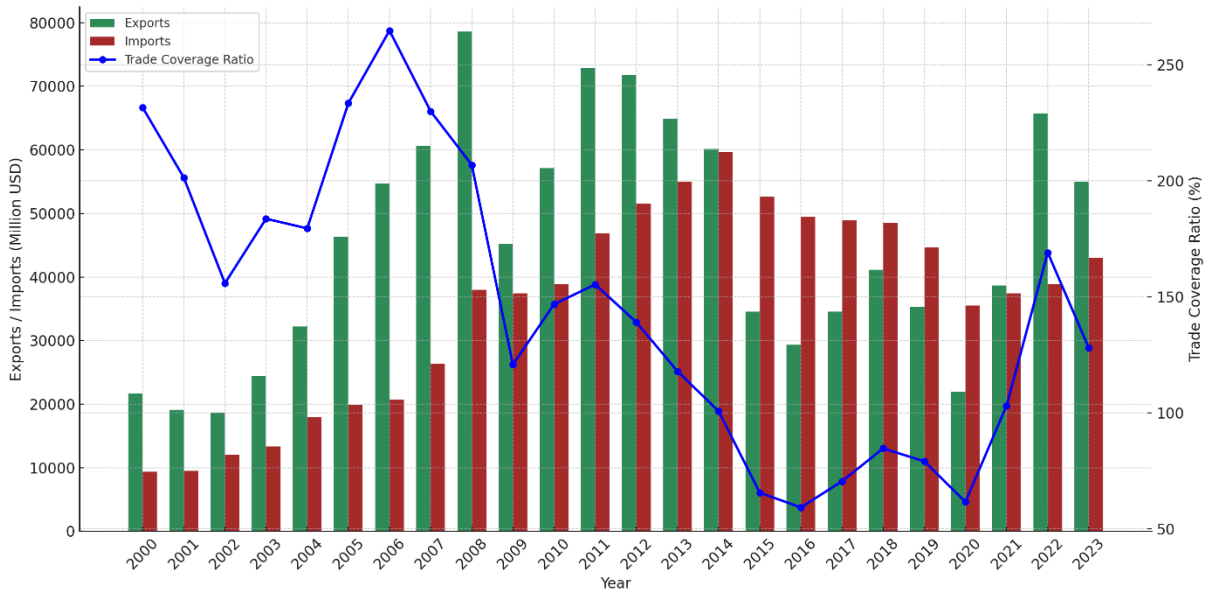
Table 01. Algeria's Balance of Trade Trends (2000–2023)

Years	Exports Billion USD	Imports Billion USD	Balance of Trade Billion USD	Trade Coverage Ratio
2000	21.65	9.35	12.3	231.55
2001	19.09	9.48	9.61	201.37
2002	18.71	12.01	6.70	155.84
2003	24.46	13.32	11.14	183.64

2004	32.22	17.95	14.27	179.49
2005	46.33	19.85	26.48	233.40
2006	54.74	20.68	34.06	264.70
2007	60.59	26.35	34.24	229.94
2008	78.58	37.99	40.59	206.85
2009	45.18	37.40	7.78	120.81
2010	57.09	38.88	18.20	146.81
2011	72.88	46.92	25.96	155.32
2012	71.73	51.56	20.16	139.10
2013	64.86	54.98	9.87	117.96
2014	60.12	59.67	0.45	100.76
2015	34.56	52.64	-18.083	65.65
2016	29.30	49.43	-20.12	59.28
2017	34.56	48.98	-14.41	70.57
2018	41.14	48.57	-7.42	84.71
2019	35.32	44.63	-9.30	79.14
2020	21.93	35.54	-13.61	61.69
2021	38.63	37.46	1.17	103.12
2022	65.71	38.86	26.84	169.07
2023	54.98	42.96	12.01	127.97

Source: Statistics of the Bank of Algeria 2000–2023

Figure 01. Evolution of Algeria's Balance of Trade, 2000–2023



Source: Statistics of the Bank of Algeria 2000–2023

Between 2000 and 2008, Algeria had a favorable trade surplus during those years, enjoying the high trade coverage ratios of exports against imports. Exports were higher than imports every year, with coverage exceeding 175% and going all the way to an overwhelming 264.7% in 2006. High demand from international markets and substantial oil prices were the predominant factors for Algeria's performance, which is mainly

dominated in export structure by hydrocarbons. Meanwhile, imports have been growing but the earnings from exports were large enough to protect the external accounts.

In 2009 with the global financial crisis: a more volatile phase for Algeria was beginning. In that year, stark declines in exports diminished trade coverage to 120.81% while the surplus itself, which amounted to an insignificant 7.78 billion USD, was brought closer to the red zone. Although exports were recovering until about 2012, volatility was at play. Come 2014, the almost-balanced trade account was only 0.45 billion USD in surplus, with a coverage ratio of 100.76%, indicating vulnerability to oil market external shocks.

Between 2015 and 2020, Algeria faced persistent trade deficits, coinciding with the oil price collapse of 2014–2015. The trade coverage ratio fell significantly, hitting a low of 59.28% in 2016. Throughout this period, imports consistently exceeded exports, despite government efforts to control import volumes. The largest deficit occurred in 2016 at -20.12 billion USD, highlighting the structural dependence on hydrocarbon revenues and the limited diversification of exports.

The period from 2021 to 2023 brought a noticeable recovery. In 2021, the country recorded a slight surplus of USD 1.17 billion, with a coverage ratio slightly over 100%. This recovery continued intensively into 2022, with exports reaching USD 65.71 billion and coverage attaining 169.07%, buoyed by recovering energy prices and stronger export volumes. In 2023, the performance moderated, with exports at USD 54.98 billion and a coverage ratio of 127.97%, while the trade surplus was very healthy at USD 12.01 billion.

Overall, Algeria's trade performance over these two decades shows a clear dependence on hydrocarbons, with export revenues and trade balances closely linked to global oil and gas prices. Coverage ratios have been volatile, reflecting exposure to external shocks. The deficits of 2015-2020 stress the risks of this dependence and the urgency to diversify exports. The resilience shown in the recovery from 2021 onward is, however, conditional on the existence of favorable circumstances; continued and stable performance will need some structural reform to enhance and diversify the export base.

2. Non-Hydrocarbon Exports in Algeria: An Overview (2000–2023)

The current section will focus on the trends of Algeria's export of non-hydrocarbon products within the time frame 2000 to 2023; growth patterns, sectoral composition, and contributions to the national economy are highlighted. It brings to focus government interventions to promote export diversification, the competition from the global market, and structural barriers to competitiveness. The main purpose of the discussion is to examine the above-mentioned elements and present a discussion on the progress and challenges in reducing Algeria's reliance on hydrocarbon revenues.

Table 02. Non- Hydrocarbon Exports in Algeria During the period 2000-2023

Year	Non-Hydrocarbon Exports Billion USD	Ratio of Non-Hydrocarbon Exports
2000	0.59	2.72
2001	0.56	2.93
2002	0.61	3.25
2003	0.472	1.92
2004	0.67	2.07
2005	0.74	1.59
2006	1.13	2.06
2007	0.98	1.61

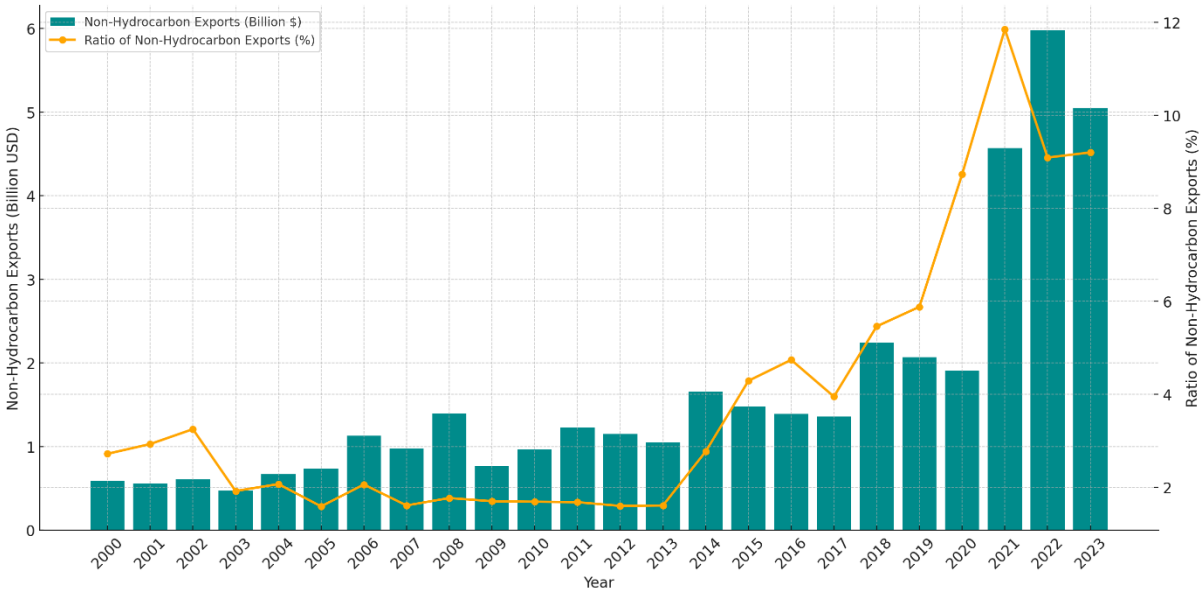
Figure 02. Non-Hydrocarbon Exports Values and Ratios 2000-2023



Source: Statistics of the Bank of Algeria 2000–2023

From 2000 to 2008, Algeria's non-hydrocarbon exports remained relatively low in value, ranging from 0.472 to 1.395 billion USD. The ratio of non-hydrocarbon exports to total exports was also modest, fluctuating mostly between 1.59% and 3.25%. This period reflects a highly resource-dependent export structure, where hydrocarbons dominated, and non-hydrocarbon sectors contributed only marginally to external trade. Slight improvements in export value were seen in 2006 and 2008, but the overall share of these exports remained limited.

Between 2009 and 2014, non-hydrocarbon exports experienced small variations in value, staying below 2 billion USD annually, with the ratio hovering close to 1.6–1.7% except for a notable rise to 2.77% in 2014. The lack of strong growth during this period suggests limited diversification efforts and the persistence of structural constraints in expanding non-hydrocarbon export markets.

From 2015 to 2020, the sector showed more promising dynamics. While export values still ranged between 1.39 and 2.24 billion USD, the ratio to total exports increased markedly, rising from 4.29% in 2015 to 8.73% in 2020. This shift was less the result of a large surge in non-hydrocarbon exports and more a reflection of declining hydrocarbon export revenues due to lower global oil prices, which made the non-hydrocarbon share relatively larger.

The period from 2021 to 2023 marked a significant impetus in non-hydrocarbon exports, with the values exceeding 4 billion USD in 2021 and recording a peak of around 6 billion USD in 2022. The ratio also recorded unprecedented levels, peaking at 11.85% in 2021 before easing to around 9% in 2023. The increase is suspected to mirror targeted measures for diversification along with improved competitiveness in specific sectors of export and good international market conditions.

Generally speaking, the data reveal a long-term upward trend in both the absolute values and share of non-hydrocarbon exports in Algeria's trade structure. However, growth has been bumpy, with substantial strides being made only recently. While this advancement is a welcome turn of events, further efforts are needed to sustain growth in high-value non-hydrocarbon industries, achieve better access for exports, and wean the country away from its heavy reliance on hydrocarbons.

3. Assessing the Impact of Small and Medium Enterprises on Non-Hydrocarbon Exports in Algeria (2002–2023)

This part focuses on the contributions made by small and medium-sized enterprises (SMEs) to the enhancement of Algeria's non-hydrocarbon export performance during the years from 2002 to 2023. SMEs are instrumental in product diversification, innovation, and the attainment of niche international markets. This section will also investigate the favorable or unfriendly institutional and policy frameworks concerning SMEs. This analysis pinpoints both potential and limitations on SMEs for export growth while articulating their strategic importance for sustainable economic diversification.

Table 03. Non-Hydrocarbon Exports and Number of SMEs in Algeria, 2002–2023

Year	Non-Hydrocarbon Exports Billion USD	Number of SMEs
2002	0.61	261853
2003	0.472	288577
2004	0.67	312959
2005	0.74	342788
2006	1.13	376767
2007	0.98	410959
2008	1.395	519526
2009	0.771	570838
2010	0.969	616072
2011	1.227	659336
2012	1.153	711836
2013	1.05	748481
2014	1.66	820738
2015	1.48	896811
2016	1.39	1014075

2022	5.98	1300115
2023	5.05	1320664

Source: Statistics of the Bank of Algeria 2002–2023

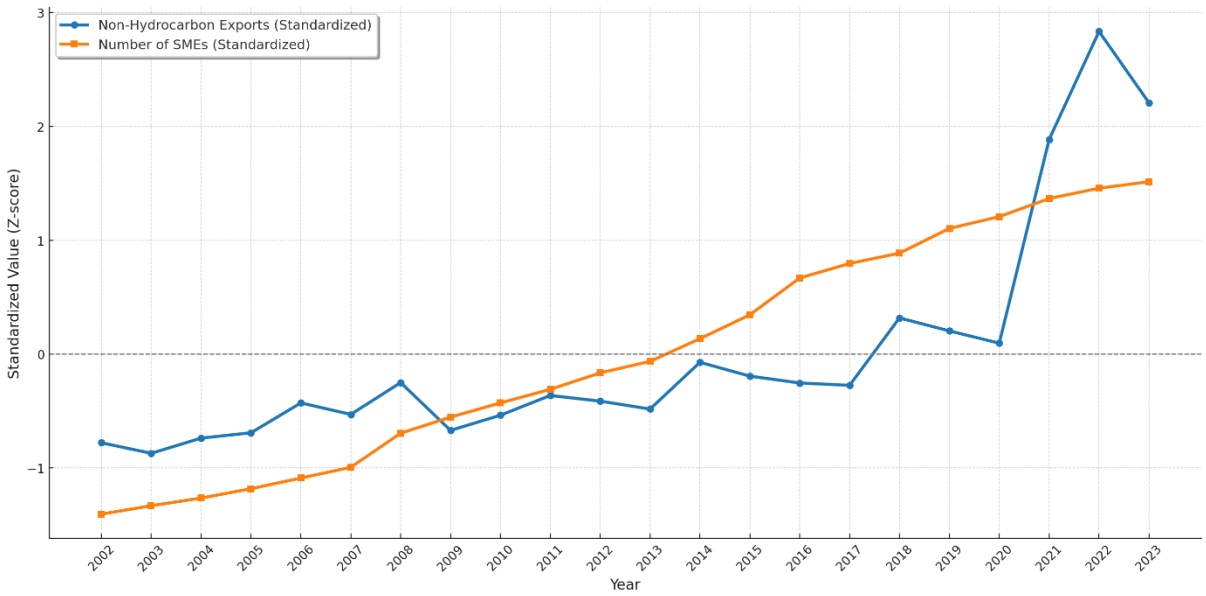
Between 2002 and 2023, Algeria witnessed a steady and significant growth in small and medium enterprises (SMEs), indicating the important role played by this sector within the national economy. The estimated number of SMEs was around 261,853 in 2002, growing steadily until overtaking one million in 2016 and further expanding to 1,320,664 by 2023. The annual growth rates fluctuated: upsurges were recorded in some years, including 2008 at 26.4% and sustained expansions from 2014-2019 which coincided with government programs aimed at the promotion of entrepreneurship and industrial diversification. Even during periods of economic slowdown, the SME sector maintained positive growth, indicating resilience and an expanding entrepreneurial base. This upward trend underscores the sector's potential as a key driver of non-hydrocarbon economic activity and export development in Algeria.

Temporal Analysis Using Normalized Trends

Figure 03 presents the standardized values of non-hydrocarbon exports and the number of SMEs in Algeria over the period 2002–2023. Standardization allows for a direct comparison between the two variables, highlighting their relative changes and potential correlations over time. This visual representation facilitates the identification of parallel trends, divergences, and periods of accelerated growth, offering a clearer understanding of the relationship between SME expansion and export performance.

Figure 03. standardized value of Non-Hydrocarbon Exports and SMEs Number in Algeria During 2002-2023

Source: Created by the authors using Python (Matplotlib), based on normalized data from 2002–2023.



From 2002 to 2008, both non-hydrocarbon exports and the number of SMEs were generally below their historical averages when standardized. The number of SMEs showed a consistent upward climb, reflecting gradual

expansion of the sector. In contrast, exports fluctuated more sharply, with noticeable dips in 2003 and again in 2009, illustrating the vulnerability of export performance to external market conditions.

Between 2009 and 2015, SME growth continued steadily, surpassing the historical mean and maintaining a stable positive trend. Non-hydrocarbon exports, however, experienced mixed performance, recovering somewhat after 2009 but remaining relatively close to their long-term average. This period indicates that, while the SME base was expanding, it did not always translate into proportional gains in export performance.

SMEs have historically crossed their average from 2016 to 2023, signifying the support for the sector on a policy and investment basis. The non-hydrocarbon exports had tremendous growth during 2021 and 2022, far exceeding their long-term averages. This export performance indicates some exceptional export performance due to potential reasons of dynamic international demand, improved trade facilitation, or through targeted diversification policies. However, such export growth was, in fact, not only far more volatile than the growth of SMEs, which stresses the fact that growth in SMEs does not automatically translate into corresponding consistent growth in exports.

From a comparison perspective, the analysis indicates that SME growth is smooth and stable, while non-hydrocarbon export growth is said to have a high level of volatility and high sensitivity to external factors. During periods of time, both series developed in the same general upward direction, but short-term movements did not always align, thereby indicating the breadth of external market forces that act beyond the narrow definition of SME growth.

Regression Analysis

A regression analysis was carried out using logarithmic transformation for the SME variable to assess the relationship between SMEs and Algeria's non-hydrocarbon exports. The statistical analysis here tries to explain to which extent the variations in SME numbers caused changes in performance on exports in the study period. The results, summarized in the following table, provide key indicators offering insights into the strength and significance of the relationship.

Table 04. Regression Results

Statistical Test	Result
R square	0,475
R square Adjusted	0,44
Constant	-23,936
Log (Number of SMEs) Coefficient	1,9137
P value	0,00038

Source: Prepared by the authors based on SPSS output.

The logarithmic regression model suggests a positive and statistically significant relationship between the number of SMEs and non-hydrocarbon exports in Algeria from 2002 to 2023. The R-squared value of 0.475 means that about 47.5% of the variation in non-hydrocarbon exports is explained by the logarithm of the number of SMEs. The positive coefficient (1.9137) indicates that as the number of SMEs increases, exports also increase — but the logarithmic nature means the growth rate of exports slows as SME numbers get very large. This supports the idea that while expanding the SME sector boosts export performance, the marginal impact decreases at higher SME counts

Results and Discussion

The evolution of Algeria's trade balance from 2000 to 2023 reflects both the opportunities and structural vulnerabilities identified in the literature on SME and export development.

From 2000 to 2008, Algeria's trade surpluses were large and sustained, with trade coverage ratios above 175% and a peak of 264.7% in 2006. This period mirrors the hydrocarbon dependency pattern highlighted by Akighir and Joseph (2019), where non-oil exports contribute only marginally to overall trade performance despite their potential economic benefits. Non-hydrocarbon exports remained low in value and share, indicating limited integration of SMEs into international markets, consistent with Christensen's (1991) observation that structural constraints hinder SME internationalization in resource-dependent economies.

The period from 2009 to 2014 was characterized by volatility following the global financial crisis, with export revenues diminishing severely in 2009 and the trade balance nearly reaching equilibrium by 2014. This trend corroborates Khattak et al.'s (2011) and Stouraitis et al.'s (2017) findings that SMEs in developing economies are especially vulnerable to external shocks, often owing to limited export readiness and internal capacity constraints. Although SMEs gradually emerged during this phase, the development of non-hydrocarbon exports remained quite modest, indicating the need for stronger institutional support, as emphasized by Lopez Gonzalez and Sorescu (2019) and Duval and Utoktham (2014).

Between 2015 and 2020, the freefall of oil prices saw persistent trade deficits with trade coverage ratios falling to as low as 59.28% in 2016. In line with Qobuljon's (2024) argument, targeted government support is essential for enabling SMEs to offset hydrocarbon revenue losses via export diversification. The aforementioned Hoivicky impacts since he cites mixed accounts in terms of SMEs and oil prices. Although SME numbers increased substantially during this period, the limited rise in non-hydrocarbon exports suggests that SME expansion alone is insufficient without complementary measures such as access to finance (Jinjarak, Mutuc, & Wignaraja, 2016; El-Said, Al-Said, & Zaki, 2015) and improved trade facilitation.

The 2021–2023 period illustrates the potential for SMEs to contribute to export diversification when external conditions and policy align. Non-hydrocarbon exports rose sharply in 2021 and 2022, reaching unprecedented levels both in value and as a share of total exports. This mirrors the "learning-by-exporting" effect described by Gkypali, Love, and Roper (2021), where sustained participation in export markets can enhance SME capabilities and competitiveness. It also resonates with the findings of Revindo, Gan, and Hambali (2024) that government assistance, combined with firm-level characteristics such as scale and experience, boosts export intensity.

The standardized (Z-score) comparison of SME numbers and non-hydrocarbon exports underscores the stability of SME growth versus the volatility of export performance, an asymmetry that aligns with Safari and Saleh's (2020) resource-based view, which stresses that capabilities, innovation, and market linkages mediate the SME–export relationship.

The econometric results further confirm the literature's position on SMEs as important drivers of export diversification. The positive and statistically significant coefficient in the log-linear regression supports Petrunenko et al. (2022) and Piratheesan (2019), who found that SME expansion correlates with broader economic growth and export potential. However, the diminishing marginal returns implied by the logarithmic model suggest that policy focus should shift from purely increasing SME numbers to enhancing their productivity, market access, and export readiness.

Overall, the findings reinforce the consensus in the literature that SMEs can make a substantial contribution to non-oil export growth in developing economies. However, as the Algerian case shows, this contribution is contingent upon enabling conditions such as financial access, trade facilitation, innovation capacity, and policy alignment, factors consistently emphasized across empirical studies in both African and Asian contexts.

Conclusion

The present study set out to examine the contribution of Small and Medium-sized Enterprises (SMEs) to Algeria's non-oil exports over the period 2000–2023, using a combination of descriptive trade analysis and econometric modeling. The results provide empirical evidence of a positive and statistically significant relationship between SME development and non-hydrocarbon export performance, confirming much of the theoretical and empirical literature that positions SMEs as key agents of export diversification and economic resilience. The analysis further reveals that while SME growth in Algeria has been steady and sustained, its translation into export gains has been less consistent, with significant surges occurring only when favorable external market conditions and supportive policies coincided.

With these findings, the case made by Qobuljon (2024), Revindo, Gan, and Hambali (2024), and Safari and Saleh (2020) that export growth spearheaded by SME is not automatic; rather, it is contingent upon such factors as access to finance, trade facilitation, innovation capacity, and institutional support becomes more convincing. The fluctuations of Algeria's non-oil exports relative to the constant growth of SMEs indicate that internal and international barriers continue to restrict the achievement of this sector's complete export range. Hence, policy measures need to extend beyond the increasing number of SMEs to focusing on building their competitiveness, promoting sectoral specialization, and integrating them into global value chains.

This particular study brings to bear not only its merits but several limitations as well. First, it relied on aggregate national data that fails to account for performance variations across industries, regions, or by firm size within the SME sector. Second, it based its analysis on the presence or absence of the correlation between SMEs and export values, failing to capture qualitative aspects such as innovation levels, market diversification, or technological sophistication. Thirdly, this study has not fully controlled for macroeconomic variables such as exchange rates, trade policy changes, or global demand shocks that might simultaneously affect SME growth and export performance. These caveats mean the estimated relationship must be interpreted more as indicative than definitive and warrants deeper investigation.

Future research could address these limitations by incorporating firm-level or sector-specific data to capture heterogeneity in SME export performance. Employing panel data methods could allow for a more nuanced understanding of how SME characteristics, such as size, age, ownership structure, and innovation capacity, interact with export outcomes over time. Moreover, comparative studies with other hydrocarbon-dependent economies could help contextualize Algeria's experience within broader structural and policy frameworks. Finally, future work could integrate macroeconomic and institutional variables into the regression framework to assess how the enabling environment mediates the SME–export nexus.

In conclusion, the Algerian case illustrates both the potential and the challenges of leveraging SMEs for export diversification. While SMEs can play a transformative role in reducing hydrocarbon dependency, realizing this potential requires a targeted policy mix that addresses structural bottlenecks, fosters competitive capabilities, and sustains market access in an increasingly volatile global trade environment.

Abstract
This research paper addresses cultural particularity as a form of distinction and difference among peoples and societies. It argues that cultural particularity continues to face processes of penetration under the illusion of cosmopolitan culture, which in reality does not aim to embrace cultural diversity as much as it seeks to devour cultures in order to impose a single, hegemonic cultural vision. Despite the opportunities offered by digital technology to highlight cultural particularity, it simultaneously compels it to reshape itself according to a universal perspective in which the very notion of particularity dissolves. Within a critical framework, this paper discusses Zygmunt Bauman's concept of "liquid culture," attempting to strip down this notion and reveal that it is merely an extension of the cosmopolitan culture that spread at the end of the twentieth century. The study concludes that the cultural particularities of societies still resist the penetration imposed by digital technology, though their levels of resistance vary.

Introduction

Culture is one of the most complex and multifaceted intellectual issues, where even the most astute mind stands bewildered before its labyrinths, often compelled to suspend its efforts to unravel its intricacies until time brings clarity. In recent decades, culture has undergone radical transformations due to the major technological shifts experienced worldwide. It has come to derive its values and meanings from the digital world, which has invaded our daily lives in an unprecedented way in human history. The digital dimension has thus become an inseparable part of the very essence of culture, posing a real threat to the previous meanings and values that still persist, to varying degrees, within cultural institutions in every nation.

With the accelerated development of digital technologies, humanity has entered a new chapter of transformation unlike any it had experienced before. This chapter has given rise to new forms of practices, relationships, and social,

cultural, economic, and political institutions, all built upon and centered around the digital space as their foundational structure.

The digital space has created new conditions that humanity has been compelled to accept, imposing requirements that have become indispensable for managing daily life. These conditions are gradually shaping a global cultural space that transcends traditional boundaries between different cultures. Accordingly, local cultures can only be present within its digital forms by either fully submitting to its conditions or adapting to them in ways that ensure their presence and preserve their continuity.

Nevertheless, it should not be overlooked that the digital space has provided greater opportunities for human communication and offered new possibilities that make the prospect of cultural coexistence more optimistic than in previous decades. In theory, all cultures, regardless of their backgrounds, are assumed to have equal access to this space and the ability to participate in shaping it. Yet in reality, practices of cultural domination persist, employing newly devised methods and increasingly sophisticated techniques. Under the dominance of a single culture whose proponents seek to impose it as a transcendent universal vision, the boundaries of national, religious, and subcultural identities become increasingly fragile, their cultural walls ever more susceptible to penetration.

It is true that the universal nature of digital spaces renders the existential meaning of any culture a digital one, such that only in this sense can it be active, dynamic, and capable of asserting its presence alongside other cultures. Yet reality does not reflect this cosmopolitan illusion of a global culture encompassing humanity in all its diversity, nor the false promises propagated by proponents of projects of peaceful coexistence among cultures.

If Zygmunt Bauman announced the dawn of a new era of global culture what he termed "liquid culture," centered on individual freedom of choice and built upon dazzling, enticing displays full of allure and temptations (Bauman, 2018, p. 21) then his project is nothing more than a continuation of the illusion propagated by globalization concerning a unified global culture. Rather, it represents yet another chapter in the ongoing threats and intrusions faced by local cultures under the pressures of digital globalization.

1- Methodological Considerations:

The central problem of this paper revolves around the impact of accelerated digital transformations on the cultural identity of peoples under the dominance of digital space, as well as the challenges local cultures face in maintaining their existence and continuity in the face of the phenomenon of "liquid culture" promoted by cosmopolitan thought in the age of digital globalization.

The objectives of this paper are to:

- Understand how culture transforms under digital technology and how this affects traditional values and meanings.
- Provide a critical reading of Zygmunt Bauman's notion of "liquid culture," showing how it represents a continuation of cultural hegemony in the age of digital globalization.
- Highlight how cultural domination continues to operate within digital space, despite promises of cultural coexistence.
- Analyze the illusion underlying the idea of a borderless global culture, showing that reality reflects cultural domination more than coexistence.

This paper employs both the critical and analytical approaches. The critical approach is used to provide a critical examination of Bauman's idea of "liquid culture," to deconstruct the cosmopolitan illusion promoted by digital space, and to highlight its contradictions with reality. The analytical approach is adopted to analyze the impact of digital technology on culture, and to examine how cultural values and meanings are transformed within the digital space.

3 -Cultural Particularity:

Although discussions on "cultural particularity" have receded in intellectual arenas during the postmodern era which has tended to move beyond the notions of collective identity and shared culture the entry of contemporary peoples into digital spaces has had profound consequences and implications for many aspects of life, including the cultural dimension. The issue no longer receives the same attention it did two decades ago. The digital environment has revived debates around culture, particularly concerning "cultural particularity" and the future of this concept, which is now more threatened than ever, especially in a digital world where almost all the particularities that historically distinguished the peoples of the world are at risk of dissolution.

Despite the prominent place of the concept of culture in intellectual debates throughout the past century especially among scholars engaged in social and anthropological studies there has been a noticeable presence of critics who opposed the concept of culture, questioned its depth, or even dismissed it altogether as unhelpful for addressing researchers' questions. Mathew Engelke (2020) identified a current of critics who undermined or ignored the significance of the concept, to the point that explicit attention to it, at least as an analytical term, declined in Britain for a long period. Interest in culture diminished significantly after the death of Malinowski, only to regain recognition later with the emergence of the Birmingham School, whose members Richard Hoggart, Raymond Williams, and Stuart Hall produced literary and social works that came to be known as "cultural studies" (Engelke, 2020, pp. 57–58).

Apart from this British approach that marginalized the concept within the academic field, culture has retained a central role across various disciplines of the humanities. In anthropology, this was evident in the works of Edward Tylor, James Frazer, Malinowski, and Claude Lévi-Strauss. In sociology, it featured prominently in the works of Pierre Bourdieu (Bourdieu, 1986). Even in media and critical studies, the Frankfurt School contributed through the works of Max Horkheimer, Theodor Adorno, and Herbert Marcuse, in what became known in their research as the "culture industry" (Horkheimer & Adorno, 2002, p. 94). Culture has been, and continues to be, the most essential and prominent component in defining the identity of peoples. Indeed, the importance of the cultural question is underscored by the impossibility of distinguishing between different peoples once culture is neutralized.

I- The Concept of Cultural Particularity:

In order to address the issue of cultural particularity, it is first necessary to define the concept of culture so that its meaning is clear in this context. Without delving into the complexities of definitions or the linguistic root of the word "culture," we adopt Edward B. Tylor's definition, which, in its broad ethnographic sense, refers to "that complex whole which includes knowledge, belief, art, morals, law, custom, and any other capabilities and habits acquired by man as a member of society" (Edward, 1920, p. 01). In this broad sense, culture refers to a shared conception that we hold with others in understanding the world around us and in shaping forms of interaction with it. At the same time, it points to differences between one society and another, and from one nation to another.

Tylor's definition leads us to infer the implicit significance of particularity in the cultural question of every society and nation. Culture is inseparable from cultural particularity, as it is bound up with three interrelated dimensions: first, its determination by place; second, its permanence in time; and third, its tendency toward organization. This stands in sharp contrast to the view of Engelke (2020), who argues that the word "culture" is too vague to be of much analytical value when applied in practice.

The confusion encountered by Engelke and those who share his view stems from the absence of clear boundaries between "here" and "there," from its continual transformations throughout history, and from its lack of qualities such as consistency, coherence, and regularity. This confusion also derives from the postmodern knowledge paradigm, which rejected the essentialist view of things. According to Diana Fuss, essentialism means "a belief in the real, true essence of things, the invariable and fixed properties which define the 'whatness' of a given entity" (Fuss, 1989, p. xi). What happened with these thinkers is that they moved beyond the essence of culture and the essence of cultural particularity on the grounds that essences tend to freeze what is not by nature fixed, and to mold what is not by nature stable.

What has further complicated the issue of cultural particularity is the instability that constitutes a part of its very essence. It unites opposites within itself and reconciles contradictions within its structure. Among its features are:

a. Stability and Change:

One of the most important contradictory features embedded in the structure of cultural particularity is its ability to

embody both stability and change simultaneously. Its stability lies in its capacity to preserve the intrinsic characteristics accumulated throughout history, in harmony with its internal environment, through its interaction with cultural and social institutions that emerge from within it, and through its responsiveness to the political and economic events it has experienced. Its changeability, on the other hand, is manifested in the flexibility it demonstrates by adjusting certain of its forms and symbols, or by abandoning them altogether.

b. Interrelation and Differentiation:

Culture possesses considerable flexibility in interacting with surrounding cultures. It overlaps with them to the point where the contours of particularity nearly vanish, and yet it differentiates itself from them to such an extent that this distinction becomes the primary criterion for distinguishing among peoples and nations. For this reason, researchers studying cultures often focus on identifying their similarities and differences. This stems from the ability of cultures to draw from one another the tools of their continuity and the means of their adaptation, depending on the historical conditions imposed upon them. Interrelation and differentiation thus refer to the capacity of a culture to engage with other cultures by exchanging symbols, values, and cultural forms giving and receiving, inspiring and being inspired, exporting and importing, rejecting and localizing.

c. Particularity and Universality:

The concept of privacy, as defined by Warren and Brandeis in their 1890 study published in the *Harvard Law Review*, is "the right to be let alone" (Sale, 2017, p. 354). Each culture has its own characteristics that distinguish it from others, features that set it apart and grant it uniqueness. Particularity endows a culture with individuality, with the capacity to maintain distinctive features, to recognize its own essence and existence, to remain conscious of its historical and geographical conditions, and to preserve its ethical mission and value-laden heritage. Ultimately, particularity constitutes a civilizational asset belonging to a specific nation, but it is also, conversely, a human legacy that transcends historical and geographical boundaries. The more a culture distinguishes itself, elevates itself, and internalizes positive values and civilizational achievements, the more it inspires others, providing them with what they deem necessary for their survival and continuity. Thus, culture embodies both particularity and universality.

This ability of culture to unite contradictions is what has led some to reject considering it as a central concept in the study of societies. Yet distinguishing between these overlapping contradictions within its structure is essential to forming a clearer conception of it. In this sense, culture is both a particular civilizational given and a shared universal legacy.

II. Dimensions of Global Cultural Flow:

Arjun Appadurai argues that the new system of cultural economy is complex, overlapping, and fragmented at the same time. It can no longer be understood through the traditional models of center and periphery, migration theory, surplus and deficit (as in classical trade balance models), or consumers and producers (as in most neo-Marxist development theories), nor even through the more sophisticated and flexible theories of global development. The complexity of the current global economy, he maintains, is linked to certain fundamental disjunctions between economy, culture, and politics, which we have only recently begun to examine theoretically (Appadurai, 1996, p. 32).

> To explore such disjunctions, Appadurai proposes examining five dimensions of global cultural flows, which he calls: (a) the ethnoscape, (b) the technoscape, (c) the financescape, (d) the mediascape, and (e) the ideoscape.
>
> The relationships among these dimensions are not uniform or symmetrical from all perspectives. Rather, they are deeply conceptual, influenced by the historical, linguistic, and political conditions of various actors: nation-states, multinational corporations, diasporic communities, as well as subnational groups and movements (religious, political, or economic), and face-to-face social groups such as villages, neighborhoods, and families. The individual, meanwhile, is the least influential actor within the movement of culture, since cultural flows are ultimately managed by agents who control their pathways. The individual's culture constitutes merely a representation of this broader flow.
>
> The **ethnoscape** refers to the people who shape the changing world in which we live: tourists, immigrants, refugees, exiles, guest workers, and other mobile groups and individuals who have become a defining feature of contemporary life. These populations appear to influence state policies and the relations among states than ever before. This dimension, as Appadurai notes, arises from globalization, which has undermined the sovereignty of nation-states and dismantled the geographical fortresses that had protected national identity and safeguarded it for two centuries (Bauman, 2018, p. 67). With the shifting needs of international capital, the demands of

production and technology, and changes in state policies toward refugees, a new kind of "liquid" societies has emerged, surpassing the rigid notions of solid nation-states (Messaadi, 2024).

The **technoscape** refers to the constantly shifting global configuration of technology, whether high or low, mechanical or informational, moving now at high speed across boundaries that were once impermeable. Many countries now serve as roots for multinational corporations. For example, a massive steel complex in Libya may involve interests from India, China, Russia, and Japan, each providing components of new technological formations. The unusual distribution of technologies, and hence the characteristics of this dimension, are increasingly driven not by clear economies of scale, political control, or market rationality, but rather by the increasingly complex relationships between capital flows, political opportunities, and the availability of labor particularly skilled technical labor in which investing countries seek to harness digital technology.

The **financescape**, in Appadurai's terms, refers to the unprecedentedly rapid flows of capital, currency, and investment, which he sees as increasingly detached from territorial anchors. The interrelation among the first three dimensions is unpredictable, each shaped by its own constraints and motivations, but each at the same time serving as both a limitation on and a measure of the movement of the others.

The **mediascape** points to the distribution of electronic capabilities for producing and disseminating information newspapers, magazines, television stations, film production studios which are now accessible to an ever-growing number of public and private actors worldwide, as well as to the images of the world these media produce. Such images involve complex distortions depending on their style (documentary or entertainment), medium (electronic or pre-electronic), audience (local, national, or transnational), and the interests of their owners and controllers. The most significant aspect of this mediascape is its ability to provide vast and complex repertoires of images and narratives in which the world of commodities becomes deeply intertwined with that of news and politics. This flow produces image-centered narratives that shape perceptions of reality, creating stories about the "Other," initial narratives of possible lives, and imaginaries that may serve as a prelude to desires for appropriation and movement.

The **ideoscape** refers to the flow of ideas, ideologies, and counter-ideologies, along with mental images such as freedom and democracy, which are often modified and manipulated according to context. These are sets of ideological images, often directly political, explicitly aimed at seizing state power or parts of it. The ideoscape consists of clusters of ideas reflecting Enlightenment ideals on a global scale. Actors seeking to impose their intellectual hegemony and political vision do so by attempting to guide the movement of thought, seeking to dominate intellectual debate within the public sphere, given the intimate link between thought, reading, and the public domain (Appadurai, 1996, p. 33).

In truth, we find many real-world examples that confirm Appadurai's observations on the dimensions of cultural flow. Yet, in the digital age, these flows increasingly take the form of reinforcing cultural unidirectionality. Digital technology has managed to fuse and reshape many of these dimensions, deploying algorithms within an industrial-economic framework of culture. The technical properties of digital technology have granted unprecedented power to control the pathways of human mobility, technology, capital, media, and ideas.

III. Digital Technology and the Power of Penetration:

From the earliest foundational ideas of modernity, Western thought became aware of the capacity of technology to bring about a qualitative leap in the fields of capital and wealth production, as well as in improving the quality of social, political, and economic life. Hence, their efforts were concentrated on developing scientific knowledge directed toward advancing technology a project heavily endorsed by the major philosophers of Western modernity, who placed great hopes on this kind of knowledge as a means for humanity to achieve wealth and mastery over nature, as emphasized by Francis Bacon (Bacon, 1900, p. 470).

What stands out most in the nature of technology is its ability to standardize practices. It not only determines the ways of doing things and ways of being in the world, but also shapes the ways of carrying out abstract activities detached from concrete contexts. Real and unique practices, such as methods of baking bread, may vary from one place to another depending on circumstances, customs, and tastes. What technology such as the automated bread-making machine does is to facilitate a routine task that is not tied to a specific place. It is a routine that can be performed anywhere in the world because it is abstract in nature. The absence of standardization at lower levels undermines the foundations of technology, since standardization is its essence. It requires the abstraction of the

inherent plurality that characterizes human practices and tangible situations. This is precisely the distinction often made between tools and technologies: tools are employed in practices that are locally specific and distinctive, while technologies are concerned with more general practices regardless of local particularities (Barney, 2015, p. 64).

From here arose the interest in technology, culminating in the digital transformation that we are now experiencing. Capitalist powers realized the pivotal role of culture in shaping people's opinions, orientations, and attitudes, and its significant influence on directing consumer behavior. This, in turn, would positively affect the revenues of major capitalists if they succeeded in controlling the sources of cultural production. For this reason, multinational corporations entered the cultural field and secured leading positions among the producers and promoters of culture—naturally aligning it with their own interests and agendas.

Thus, thanks to its unique features, digital technology has managed to deeply penetrate every domain of life, imposing new and varied forms of relationships. In recent years, with the Internet and other information technologies, transformations have affected fundamental aspects of life: we no longer play or work as before; our modes of communication and consumption have changed; our methods of knowledge creation and learning have shifted; even our understanding of politics and participation in public life is no longer the same (Trend, 2001, p. 1).

5- Culture and the Illusion of Cosmopolitanism in Digital Societies:

> "There is no single human civilization, but rather multiple civilizations" (Mattelart, 2008, p. 20). Yet, as mentioned earlier, culture is defined by two existentially inseparable traits: the tendency to return to its roots through its deep connection to heritage and the past, and its capacity to open up to the world in order to adapt to contemporary conditions. However, with technology permeating human life and communications globalization taking on a cosmopolitan character, the trait of openness and forward orientation has overshadowed the trait of closure and return to the past. This situation has revived the problem of cultural particularity, which is now more threatened than ever in favor of a cosmopolitan culture, in a world whose spaces are almost entirely digital.
>
> Cosmopolitanism is a humanist orientation that advocates making the world one unified homeland for all humanity. Under the umbrella of global citizenship, its proponents reject the notions of the nation-state. According to Martha Nussbaum, cosmopolitanism does not mean that its adherents propose abolishing local and national forms of political organization in favor of a world state; rather, their view was more radical: we must not give our primary allegiance to any form of government or temporal authority, but to the moral community composed of the humanity of all people (Nussbaum, 1996, p. 7).

For cosmopolitans, cultural particularity constitutes a real obstacle to the realization of global citizenship. All cosmopolitans are compelled not to act in accordance with the dictates of local cultures or national expectations when these values and behaviors conflict with universal standards of human conduct (Nussbaum, 1997, pp. 8–14). Local cultures are thus acknowledged only insofar as they contain universal values shared by all peoples. In this way, a hybrid culture is formed, where the cultures of nations intersect within unified values, and individuals, as Samuel Scheffler explains, achieve self-realization and flourishing by shaping identities with distinctive features derived from diverse and heterogeneous cultural sources. These are not regarded as being defined by descriptive ties to a particular culture, community, or heritage (Scheffler, 1999).

It is notable that cosmopolitan culture gained significant traction and wide dissemination during the last decade of the twentieth century, a period marked by the rise of concepts of freedom and democracy, the decline of socialist slogans, and, at the same time, the globalization of communications and media. Media, in particular, became a key vehicle in promoting cosmopolitan cultural values and standards. Paul Hopper (2007, p. 62) points out that the globalization of media was further intensified by the rise of giant multimedia corporations such as Disney, Sony, Bertelsmann, General Electric, News Corporation, Warner Media, and Viacom. The concentration of ownership of these corporations in the hands of a few conglomerates enabled them to dominate entertainment industries by controlling financing, production, marketing, and distribution of their film and television products.

It is important not to conflate the globalization of cultural industries with what might be called global culture (Wolton, 2005, p. 46). The culture disseminated by these global corporations is, in reality, a mosaic of cultures that have absorbed elements of modernity, a scattered patchwork of cultural fragments. The primary beneficiaries of exporting this cultural product worldwide are, of course, the owners of these massive media corporations. What they produce cannot, in any sense, be described as global culture, but rather as the globalization of cultural industries.

The digital transformations of the last two decades have added another, more pronounced and complex, dimension to the concept of cosmopolitan hegemony. The practices dominating the global cultural scene in the digital age reflect only a set of values and principles that transcend those upon which human cultural communities across the world were historically based. Thus, cosmopolitanism, in the end, is nothing more than the ideology of "the elites," who themselves, as Dominique Wolton notes, are firmly rooted in strong, well-defined identities (Wolton, 2005, p. 50). The term "cosmopolitan culture," even if it has receded in academic writings over the last two decades in favor of the notion of "liquid culture," does not significantly differ from it in either conceptual or ideological content.

The term "cosmopolitanism" emerged simultaneously with the spread of digital media, just as the concept of "liquid culture" appeared with the globalization of media two decades earlier. From another perspective, if digital media is nothing but a technical extension of media globalization, then the notion of liquid culture is merely an extension of cosmopolitan culture—if not the very same concept under a different label.

6- Liquid Culture or Penetrated Culture?

To describe the condition into which culture has devolved in contemporary societies, Zygmunt Bauman used the term "liquid modernity," referring to a state in which no form of social life is able to retain its shape for long just like liquids. In this state, culture takes shape in accordance with individual freedom of choice and the individual responsibility that accompanies it. Its function becomes the continuous maintenance of this choice as both a vital necessity and an inevitable duty (Bauman, 2018, p. 19).

In Bauman's formulation, culture no longer exercises any supervisory or disciplinary role; it is no longer the functional complex that once contained mechanisms for preserving stability, balance, and direction. Culture has suffered profound fractures, and societies have entered into a condition where "cultural identities" and "cultural particularities" are dissolving. If Friedrich Nietzsche once proclaimed the "death of God," then Bauman, in turn, proclaimed the "death of particularity" (Bauman, 2017, p. 43). This, he argues, is the outcome of contemporary societies becoming digital societies, where individuals themselves voluntarily lead their cultural even personal particularities to the "slaughterhouses" of the digital spaces, sacrificing them to its allure.

Bauman's description of contemporary societies as "liquid societies" appears to be an extreme characterization. If we view it as a product of a pessimistic anticipatory vision, then it is an exaggeration of pessimism. He paints an overarching picture of societies, with all their institutions, systems, standards, and values, sinking into boundless liquidity. For him, the dissolution of all that is solid is the essential feature of the modern form of life from its inception. Nothing is exempt from this process, not even the most solid forms, including those rooted in the historical foundations of societies.

At the very least, this view creates an unsound equivalence among different cultural institutions upon which societies have been built. In his account, there is no distinction between music, prayer, fashion, religion, cinema, or houses of worship. All are thrown into the same blender, all subjected to dissolution and fusion, until they take on liquid forms, blending with one another, and their symbols and meanings merging to the point of indistinguishability. This is an overstated portrayal, for what Bauman's thesis neglects is that culture has historically formed in layers some harder and more resistant to penetration or reshaping, others more flexible and quickly subject to change and dissolution.

1- Liquid Culture:

If we are to apply the metaphor of liquidity to any layer of culture or to one of its symbols, it would undoubtedly apply to the first layer of culture—namely, the manifestations of daily life shaped by market values and excessive consumption. These are reflected in clothing, fashion, music, cuisine, furniture, and so forth. Such daily practices appear almost uniform across much of the world's populations. McDonald's meals, Adidas clothing, Chanel perfumes, Samsung phones, and similar global brands have penetrated nearly all markets, becoming present in every country and accessible to many peoples, thereby blending into the cultural lives of numerous societies.

Yet, many societies still maintain their cultural identities in clothing styles, culinary traditions, musical genres, architectural methods, and furnishing practices. In these everyday manifestations, cultural differences remain evident, with many communities continuing to uphold traditions deeply rooted in history.

Bauman's inability to recognize these cultural differences stems from the Western centrality underlying his perspective, which obscures the stark contrasts between Western culture submerged in its liquid form and other cultures that have retained a more solid character. Societies of the southern Mediterranean, for instance, continue to preserve their musical traditions and wear wool and camel hair garments. Gulf communities remain faithful to the white thobe and red-checkered headscarf. Many East Asian societies still uphold authentic cultural practices, such as serving meals with bamboo chopsticks rather than metal spoons, and favoring traditional rice and fish dishes over hamburgers and McDonald's meals. Thus, we argue that if liquid culture has achieved any success, it is largely confined to the superficial and external layer of many societies' cultures. This interpretation is reinforced by Bauman himself in *Liquid Culture*, where he focused more on music, fashion, and art (Bauman, 2018, p. 25) than on the institutions that sustain them.

Indeed, there is a powerful process of cultural penetration being advanced by global economic interests seeking to impose a universal culture of their own making. However, the cultural practices encouraged by technology and promoted by digital media cannot be attributed to deeply rooted social and cultural institutions. Rather, they are practices that are quick to be adopted and just as quick to dissolve. They are contagious and spread rapidly thanks to media and global digital communications. If they are to be linked to any institutional or value-based foundation, it is only to those institutions dominated by the forces controlling the flows of capital and the global economy. In the end, liquid culture is nothing more than the product of an imperial cultural industry, the result of a pragmatic vision ultimately governed, paradoxically, by a solid hegemonic culture that resists liquefaction and dissolution.

2- Penetrated Culture:

We must first acknowledge that major institutions and corporations controlling cultural industries have succeeded in commodifying many cultural symbols, and we must also recognize that they have managed to dissolve numerous cultural practices. Yet, in contrast, these achievements continue to face considerable resistance supported by older social and cultural institutions. Families, education systems, political parties, and various social and political organizations in many societies and countries around the world remain vital, preserving the functional roles entrusted to them. Despite the fierce campaigns of penetration targeting institutions rooted in modernity and pre-modernity, these institutions still endure today, continuing to perform their functions effectively within many societies.

Although contemporary societies are undergoing profound transformations due to the digital revolution, preexisting values and biases—deeply embedded in broader social and cultural systems are reflected in the digital structure of platforms, and may even be amplified through them (Yue Qian, 2024). For this reason, some have argued that the consequences of computers themselves are no greater than those brought about by literacy. Conversely, figures like Goody and Kittler contend that the use of a new communication medium may indeed alter people's views of the world, at least in the long run (Asa Briggs, 2009).

This long-term effect is nothing but a form of penetration exerted by digital technology upon social and cultural institutions still tasked with preserving and revitalizing cultural particularity. Institutions such as the family, the arts, houses of worship, local media, and diverse social and political organizations all represent subsidiary authorities that operate in a functional harmony to regulate social practices and safeguard particularity from cultural intrusion and deviation. Because these institutions are mutually coherent and functionally interconnected, their cohesion has created a cultural wall that protects the cultural body against every attempt at penetration. The endurance of these

institutions and their resistance to rapid change is due to the culture's ongoing efforts to confront and withstand the various forms of infiltration imposed upon it by digital technologies.

3- Solid Culture:

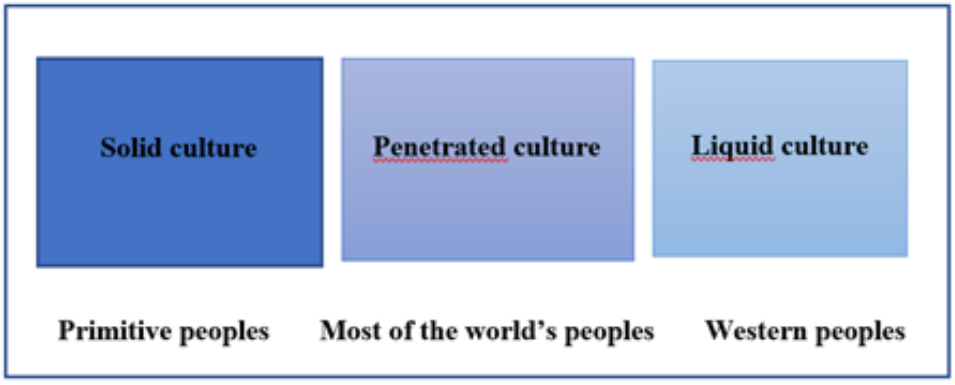
If institutions such as the family, the arts, houses of worship, local media, and various social and political organizations serve as the reservoirs where each society's cultural values are deposited, then religion, ethnicity, homeland, and shared history—accumulating experiences across time—are the great factories that generate values and from which societies derive their cultural identity. For this reason, the ultimate target of the penetrative attempts against cultural particularities has been these solid institutions, through efforts to disable their capacity to produce living values and generate meaning.

The persistence of religion, ethnicity, and homeland to this day, despite the universality of digital communications, is the strongest evidence that there are still cultures which remain solid, even if their peoples appear, in daily practices, to be dissolving into a unified cosmopolitan identity. A Muslim remains a Muslim, a Jew remains a Jew, a Christian remains a Christian, and likewise for the Eastern religions. Even nation-states, in the Westphalian sense established by classical modernity, still endure to this day, with loyalty to them remaining strong: the French are French, the Belgians Belgian, the Italians Italian, and so forth.

Despite the solidity of these major institutions that distinguish nations from one another, and despite the strength of the cultural wall safeguarding each identity, they remain vulnerable to ongoing attempts of penetration. Digital commerce constitutes an economic project aiming to undermine the sovereignty of the classical nation-state. The digital citizen represents an ideological project working to transcend local identities. The so-called Abrahamic religion constitutes a doctrinal project seeking to dissolve the three revealed religions (Islam, Christianity, and Judaism) and fuse their laws into a single liquid global faith.

Nevertheless, these major cultural institutions are not equally solid. Some continue to maintain their historical identity, while others have endured severe shocks that disrupted their long-standing stability. Cultural particularity also varies from one society to another. Some cultures remain solid, such as "primitive" cultures living in the jungles of Africa and the Amazon forests. Others continue to experience infiltration of their institutions and structures, as is the case with most of the world's cultures. Still others have surrendered entirely to processes of dissolution and fusion, as is evident among many populations in Western Europe, Australia, Canada, and the United States.

Figure (02): Types of World Cultures



Source: by the researcher

The overlap between the concepts of cosmopolitan culture and liquid culture appears more clearly with Zygmunt Bauman, when he addresses culture by saying: *"The purpose of culture, according to its original meaning, was to be a factor of change, not a factor of maintaining the status quo. Its role was to serve as a means of leading social development toward a universal human condition"* (Bauman, 2018, p. 15). Bauman's proposition fully aligns with the cosmopolitan vision of culture, a vision that transcends cultural particularities and goes beyond local standards and values. If there is any difference between the two concepts, it lies only in the approach. While the advocates of cosmopolitanism presented this concept within the framework of providing a universal ethical vision in which the

world is governed by global human values and standards, the concept of liquidity proposed by Bauman came within the framework of providing an anatomical reading of contemporary societies governed by the standards and values of the market and excessive consumption.

On this basis, we can say that there is no cosmopolitanism except for those who benefit from it (Woolton, 2005, p. 46). It is a neoliberal cosmopolitanism governed by powerful economic forces that drive contemporary globalization and seek to establish a universal system deeply embedded in the social and political life of cultures opposed to it, while protecting the flows of global money and trade. If those who produce and control information and its means of dissemination in societies during the age of television and mass communication are the ones who rule, dominate, and impose their vision on others (Bourdieu, 2004, p. 26), then the culture of the Internet and the digital world is ruled by business entrepreneurs responsible for spreading Internet culture throughout society. According to Manuel Castells, they are those elites of businessmen operating on the Internet, who are at the same time artists, prophets, and greedy men, as they hide their social unification behind their technical ingenuity (Castells, 2001, p. 6). Thus, those who control the tools and technologies of the digital world are the most capable of shaping culture and imposing values within digital societies.

7- Culture between Liquidity and Solidity in Digital Societies

Digital technology plays a decisive role in differentiating the cultures of peoples between liquidity and solidity. The relationship between liquid culture and technology is directly proportional; the more societies transform into digital societies, the more their cultures become liquid and submissive to the cultural standards imposed by the digital world. As for societies distant from the digital world, their cultures remain solid and their particularities intact, while the cultures of most peoples remain oscillating between solidity and liquidity due to the ongoing penetrations they are still exposed to.

The civilizational leap experienced by Western societies would not have occurred without the technological development they achieved in the later ages. For the rest of the world's peoples, if they wish to keep pace with this development, there is no path except through adopting digital technology, which created the glory of those societies. Yet, they must pay a price if they wish to achieve this desired catching-up, and this price is none other than willingly surrendering their cultural particularities to the authority of digital technology, which almost singlehandedly dominates the making of today's civilization. Thus, cultural identities are reshaped according to a universal vision dictated by the conditionality of the contemporary digital civilization. In this sense, Michel Foucault states: *"He who is subjected to a field of visibility, and who knows it, is the bearer of the constraints of power; he makes them play spontaneously upon himself"* (Foucault, 1977, p. 202). This is precisely what happens with different peoples of the world: peoples engaged in the digital sphere see their cultural particularities completely violated, while peoples where digital technology is still weakly spread continue to preserve the vitality of their cultural particularities.

If we look at the rate of Internet penetration among peoples, we find that 94% of the peoples of the European Union have Internet access, according to a survey conducted in 2024 (Digital_economy_and_society_statistics, 2024); 97.1% in the United States of America (Statista, 2024); and 94.9% in Australia (Digital 2024: Australia, 2024) in the same year. These peoples are in fact the very Western societies from which Zygmunt Bauman derived his conceptualization of culture as liquid culture.

In contrast, these percentages decline among the rest of the world's peoples: 73.9% in West Asian societies, and 72.4% in North Africa, for instance societies that may be considered to have a relatively cohesive cultural background, yet are subject to continuous and significant penetrations. This description applies to most peoples and societies around the world. As for the peoples who still enjoy relatively authentic and solid cultures, Internet penetration there is low compared to others: in Central African societies it does not exceed 31.8%, and 26.8% in West African societies in the same period (Internet penetration rate worldwide, 2025).

The observation is that there is an inverse relationship between the openness of cultural particularities and the rate of Internet penetration and digital technologies within them. The more prepared societies are to transition into the digital world, the more their culture is vulnerable to dissolution and transformation into a liquid culture.

Conclusion

Throughout their long history, societies have accumulated their cultural particularities that make them differ from one another, in order to distinguish themselves from each other. Alongside inventions and experimental sciences,

they have been preoccupied with discovering existence, either to harness it for managing the affairs of life, or to adapt it for use as a weapon in their conflicts with other nations. From this, we can say that every technology created by humankind contains within it two things: its use for managing life affairs in ways that reflect its culture, and its employment as a weapon against enemies to preserve its cultural identity. In this sense, culture is the condition for the realization of the existence of human societies, and thus it precedes technology in time.

On this basis, digital technology is nothing but a contemporary form of managing increasingly complex human life, and one of the most advanced weapons through which those who dominate it seek to extend their influence over all peoples and impose their culture on all cultures.

According to Darin Barney, social researchers have differed in their outlook on what societies will become in the post-industrial stage. While Bell sees in this transformation the possibility of overcoming the most humiliating and unjust aspects of the industrial era, an opportunity to make society more prosperous and participatory, to bring about better education, a flourishing global economy, and scientific progress free of ideology, another group of theorists and researchers sees in this transformation a forewarning of societies turning into programmed, one-dimensional societies. Such a transformation would deepen capitalist alienation, exposing human life to domination and irrational exploitation under the guise of rational, objective technology (Barney, 2015, p. 17).

We can extend this divergence to the transformation that cultural life is witnessing among peoples at the present moment. While some see that the transition of societies to the digital form will provide greater opportunities for protecting cultural particularities through the possibilities of digital presence of different cultures, it can also be said that these digital transformations enhance the penetrations cultures are subjected to, represent an opportunity for the assassination of cultural particularity, and a broader extension of digital dominance and a new universal culture.

At the same time, despite the major fissures that have affected the structure of cultural particularities of different peoples due to the penetrations practiced upon them, and despite the digital tools and technologies employed for this task, we can say that many of the world's cultures are still resisting the assassinations they are subjected to. Social and cultural institutions and the mechanisms for repelling these penetrations continue to perform their functions properly. Every external authority that tries to dominate them is confronted by an internal force that works to resist it. Resistance, in the Foucauldian sense, is concomitant with power. Wherever there is power, there is resistance. If digital societies are a form of power, then many human cultures possess the capacities that make them able to generate tools to resist penetration and methods to avoid dissolution and melting away.

Acknowledgment and Conflict of Interest

Acknowledgment

The author would like to express his gratitude to the Laboratory of Sociology of Cultural Communication: Values-Practices-Representations, Amar Telidji University, for providing academic support and intellectual guidance throughout the development of this study. Special appreciation is extended to colleagues and peers whose constructive comments contributed to enriching the quality of this research.

Conflict of Interest

The author declares that he has no known competing financial interests or personal relationships that could have appeared to influence the work reported in this paper.

Keywords Algeria, China, partnership, The Belt and Road Initiative, gains and challenges.

Abstract

The article discusses the impact of Algeria's accession to the Belt and Road Initiative on the Sino-Algerian partnership, after learning about the nature and level of relations between the two countries, as well as of this Chinese initiative, which expresses China's future strategic vision to enhance its international standing.

We eventually learned through it that the Sino-Algerian partnership has entered a new stage of development since Algeria joined the Belt and Road Initiative in 2019, which will work to strengthen the bonds of partnership between them and open broad horizons for both parties China seeks through it to strengthen its influence in Algeria, and to benefit from its resources and all its geostrategic assets, while Algeria aims to achieve significant economic growth rates and breaks free from economic dependence on hydrocarbons and the West.

1. Introduction

The field of international relations has witnessed a significant transformation since the post-Cold War era, both at the theoretical level and in the nature of international relations. This shift laid the foundation for intellectual approaches aligned with the new balance of power, marking a transition from a focus on hard power to a new concept emphasizing the importance of soft power in international relations, ultimately leading to the notion of smart power.

This theoretical development was accompanied with another development on the level of the international dynamics marked by the rise of new international powers influencing the international system among which China is the most significant and most important, because of what it possesses of tremendous potentials, civilizational, cultural, military, strategic, and especially being considered as a huge economic power, with its highest economic growth rates in the world These potentials have enabled China to actively open up to various regions of the world

through the implementation of large-scale projects aimed at achieving both economic and political gains. These efforts support its ambitions to secure its status as a major, globally responsible power, thereby protecting its interests and preserving its freedom of action in international affairs One of the most prominent and significant projects for China is "the Belt and Road" Initiative, through which it seeks to strengthen its influence and expand its global trade. This initiative is particularly important as it connects three continents—Asia, Europe, and Africa—inevitably leading to fundamental changes in the course of global trade.

Despite not being located on the historical Silk Road between China and Europe, Algeria represents a pivotal point in "the Belt and Road" Initiative due to its position as a connecting hub between Europe and Africa, as well as its possession of numerous elements and factors of strength. Additionally, there are strong historical ties between the two parties With Algeria officially joining the Belt and Road Initiative in 2019, its partnership with Beijing entered a new phase by agreeing on carrying out a significant number of projects and put into action many Chinese companies, the project of building the biggest port in Africa and in the Mediterranean basin is considered as one of those most prominent projects.

Herein lies the importance of the study which revolves around trying to understand the foundations and the objectives of the Chinese new strategy through "the Belt and Road" Initiative while highlighting the position of Algeria within it, and assessing the extent to which this initiative contributes to strengthening the Chinese-Algerian partnership.

Based on this we pose our research problem as follows:

To what extent does the Belt and Road Initiative contribute to supporting the Chinese-Algerian partnership?

To thoroughly address this central question, it is necessary to formulate the following sub-questions:

- What is the reality of Chinese-Algerian relations?
- What are the objectives of the Chinese Belt and Road Initiative?
- What is Algeria's position within the Chinese strategic perspective?
- What are the most significant gains of both parties from the Initiative? And what are the main challenges they face in achieving it?

To answer this research problem as well as the sub-questions we propose the following hypothesis:

The more the partnership between China and Algeria is built on mutual gains within the framework of the Belt and Road Initiative, and the more the various challenges they face are overcome, the more successful and strengthened their partnership becomes.

To address this topic, the descriptive-analytical approach has been employed in order to examine the current state of the Chinese-Algerian partnership under the Belt and Road Initiative and assess its contribution to achieving Algeria's strategic objectives. This has been done by exploring and de-constructing the various concepts and variables of the study, interpreting their significance, and establishing connections between them to arrive at answers to our research questions Our study is also based on the historical approach for a deeper and more accurate understanding of the subject, so we studied and analyzed the historical relationships between China and Algeria and its impact on the current state of bilateral relations.

The plan of the study has been divided into three main sections, the first section is about the nature and level of the Sino-Algerian relations, the second section discusses the contents of the Chinese Belt and Road Initiative of the twenty first century, then section three which is devoted to study the extent of the Belt and Road Initiative contribution to a new entry for strengthening the Sino-Algerian partnership.

First: The Nature and Level of the Sino-Algerian Relationship

Algeria is one of the most important countries within China's foreign strategy, given the significant growth in Sino-Algerian bilateral relations. These relations are part of the broader development of China's trade and economic ties with the African continent. This growth can be attributed, on one hand, to China's economic development, characterized by rising growth rates, an increased need for raw materials, and the demand for external markets and profitable investment regions. On the other hand, it is also a result of the opening up of Algeria's economy and the trade diversification strategy adopted by the Algerian government. All of this has led to the establishment of strong relations between the two countries.

The Sino-Algerian relations are considered as one of the strongest interactive relations in the international environment thanks to the common historical ties, among which is the mutual support of each other's causes, notably through their historical support for liberation movements, and their unconditional mutual alignment on various political and economic issues whether nationally or internationally.[1]

The relations between China and Algeria have passed through numerous main transformations over the past half century. These shifts have been shaped by factors related to China's strategic outlook, internal dynamics within Algeria, and broader changes in the international landscape. It can be said that this relationship has passed through three main phases, shifted between the intense mutual interest mainly on China's side during the 1960's and 1970's when Algeria was viewed as a region of strategic interest (the era of Maoist China), then the phase of Perceived neglect from the late 1970's until the early 1990s (China's reform period after 1978 under Deng Xiaoping's rule), finally China renewed interest to Africa in general and to Algeria in particular (China's growing role period in the world and Africa) beginning in the late 20th century till the present day.

The First Phase: The establishment of the People's Republic of China by Mao Zedong in October 1949 coincided with the launch of Algeria's liberation revolution against French colonialism. The historical support that China committed to the Algerian liberation movement is considered the foundational pillar that laid the groundwork for the current state of Sino-Algerian relations China was the first non-Arab country that admit "the Provisional Government of the Algerian Republic" early in December 1958, then established diplomatic relationships in the same month, in addition to China's full support for the independence of Algeria in 1962.[2]

Therefore, the nature of interest during this phase was primarily political ideological, since China was supporting the discourse that characterized the Third World "South- South" established over the past, by a call to collective struggle against all forms of imperialism, what led to a tremendous consensus on positions between China and Algeria regarding several issues most importantly "supporting liberation movements", in addition to the positive position of Algeria towards China regarding Taiwan's independence and China's restoration of its permanent seat at the United Nations Security Council in 1971.[3]

The Second Phase: Since the death of Mao Zedong in 1976 until the early 90's, China concentrated on implementing a broad internal reform process mainly in the economic field under the rule of "Deng Xiaoping" what affected its foreign policy, China distanced itself from its third world traditional allies, gradually reduced its foreign aid and adopting a more subdued stance in opposing the "irrational international system" dominated by the West, this position was reflected in China's relationship with African countries, including Algeria, where there was a significant decline in China's diplomatic, economic, and trade activities in the region.

The Third Phase: however, since the end of the Cold War, a new phase emerged, China renewed and intensified its interest in Algeria, this return was affected by the changes of the international environment on one hand, and by the pressing priorities of the Chinese strategy on the other hand, particularly after pursuing economic reforms and the tremendous growth after following a more liberalized economy governed by market logic, the Sino- Algerian relations transformed from being " ideological commitment" to be economic " pragmatic" relations built on mutual interest and independence,[4] This shift was further solidified with the launch of the Forum on Chinese–African Cooperation (FOCAC) in October 2000, which became an effective mechanism for dialogue and cooperation between the two sides,[5] as well as the establishment of the China–Arab States Cooperation Forum in September 2004 as an institutional framework for Sino-Arab relations. Additionally, China adopted a firm stance against internationalizing the crisis of deteriorating security conditions in Algeria during the "Black Decade" affirming its commitment to non-interference in Algeria's internal affairs and its full respect for Algerian absolute

sovereignty Besides, while Europeans hesitated to invest in Algeria during this decade because of the security situation, the Chinese inflows have reached its peak, with investments reaching around 800 million dollars.[1]

Accordingly, trade between the two countries have known a huge expansion within the beginning of the year 2000, mainly by granting the Chinese companies contracts to execute work projects of large- scale, and which witnessed a noticeable acceleration until the present time, as the bilateral trade relations growing steadily from 191 million dollars in 2000 to 1.75 billion dollars in 2005, reaching 2 billion dollars in 2006.

The 2014 was a watershed year, as the Sino-Algerian relations were elevated to the level of a strategic partnership in fields like economics, military, technology, politics, culture...etc, as both parties signed an agreement framing that on May 25th, 2014, as a consequence, the Chinese investors became the most active in Algeria, in many sectors like public works, construction, communication, industry, energy and mining,[2] among others The trade volume between the two countries has significantly increased to reach 9 billion dollars in 2018, and so to become at the top of Algeria's suppliers list, and displacing the dominance of the traditional Western partners particularly France,[3] as a result, China became Algeria's first trade partner.

In the Political sphere, the big consensus about the political issues and the clear harmony in the diplomatic positions always existed for both countries, besides the strategic relations were never limited to the political and economic levels, but expanded to other sectors including medical domain by sending Chinese medical missions and equipment to Algeria, in addition to tourism and cultural domains, as well as the military section by importing several weapons and military equipment, the partnership also included the space sector exemplified by the launch of Algeria's first communications satellite designed for telecommunications and internet services from a Chinese launch base.[4]

To underscore the depth of their rapprochement, Algeria and China signed a Memorandum of Understanding on September 4, 2018, concerning cooperation in the building and implementation of the Belt and Road Initiative, during the Forum on China-Africa Cooperation Summit held in Beijing. The memorandum was officially ratified on June 6, 2019, marking Algeria's formal accession to the Silk Road Economic Belt and the 21st Century Maritime Silk Road.[5] From that point on, Sino-Algerian relations took an upward trajectory, evolving into a strategic alliance within the framework of a vast global initiative. This development raises important questions regarding Algeria's position within the project, and whether it will indeed contribute to strengthening and deepening the Sino-Algerian partnership.

Second: Contents of the 21st Century Chinese Belt and Road Initiative:

This section contains a detailed overview of the Belt and Road Initiative proposed and implemented by China since 2013, by examining the background that led to the establishment of this Initiative in order to revive the ancient Silk Road but with new objectives.

2. 1. An Ancient Initiative with New Perspective: The Ancient Silk Road/ and The New One

The Belt and Road Initiative is considered the greatest project in the human history, as it is the primary driver of China's domestic policy and a cornerstone of its foreign diplomacy, it aims to rise high the banner of peaceful development on the basis of the ancient Silk Road history back to 2000 years ago,[6] which is a naming for a couple of land and maritime roads connected to each other as ships and caravans traversed linking China and Europe mainly for the Chinese silk but also perfumes, incense and spices trade It stretches over approximately 12,000 kilometers, extending from the commercial hubs in northern China then splits into two routes, the northern route which traverse Eastern Europe, the Black Sea, and the Crimean Peninsula all the way to Venice, then the Southern

route that passes through Syria and end up into Egypt and north Africa, or through Iraq and Turkey all the way to the Mediterranean Sea.[1]

The Silk Road's origins are back to the reign of the Han Dynasty in China, around 200 BC. The term was given in 1877 by the German geologist Ferdinand Von Richthofen.

The ancient Silk Road founded many connections between East and West, enabling many civilizations to make profit from one another, it played a pivotal role in intellectual and cultural exchange, and so contributing in flourishing many civilizations such as the Chinese, Egyptian, Roman, Indian among others, as it contributed in the growth of many coastal cities located near ports and along the route, The Silk Road's function as a key trade corridor for silk came to an end with the rise of the Ottoman reign and the consolidation of its Empire.[2]

However coming back to the 21st century Belt and Road Initiative which was revived by the current president "Xi Jinping" just six months after being elected, he restructured China's domestic framework and adopted a bolder foreign policy than his predecessors, this Initiative's slogan is "pro-activeness" which is driven by a strong emphasis on achievement. This marked the end of Deng Xiaoping's[3] era of reactive foreign policy Xi Jinping introduced "the Silk Road Economic Belt" Initiative in his first official visit to Kazakhstan, during a lecture delivered at Nazarbayev University entitled "Promoting Friendship between Peoples for a Better Future".

In the following month during his visit to Indonesia, the Chinese president called for the establishment of the 21st Century "Maritime Silk Road" aimed at connecting China with ASEAN countries, as well as with South Asia, Africa, and Europe. As a result, the concept of "One Belt", "One Road" emerged as a result of the Chinese suggestion mentioned above.[4]

The initiative has undergone at least three name changes over the few last years: "Silk Road in 2013", "One Belt One Road in 2014" and finally "the Belt and Road Initiative" since 2015 This Initiative aims to connect China to the rest of the world through investing billions of dollars in infrastructure all along the Silk Road that connects China with Asia, Europe and Africa, to stand as the largest project in the human history for the construction of ports, roads, railways and industrial zones.[5]

2. 2. The Geographical Scope and Strategic Pillars of "The Belt and Road" Initiative:

The Chinese Silk and Road Initiative is a long term project, aiming to integrate Asia, Europe and Africa into a network of primarily economic relations by building the land-base and maritime infrastructure.

At the beginning it included 60 countries, then the number increased to become 140, what extend the Initiative's geographical scope from Eurasia to Africa, and Latin-America and the Caribbean, as well as the South Pacific region distributed as follows: 40 countries in Africa, in the south of the Sahara, 34 countries in Europe and central Asia, 24 countries in Eastern Asia and the Pacific, 17 countries in the middle East and North Africa, 19 countries in Latin America and the Caribbean, 6 countries in South East Asia, collectively, represent approximately 40 percent of global GDP.[6]

Therefore, the Initiative is founded on a philosophy that transcends the traditional narrow geographic conception of regional cooperation projects, Rather than being confined to a fixed geographic or geopolitical region, the Belt and Road Initiative has, from the outset, been based on an expansive and inclusive spatial scope that aims to encompass the largest possible number of countries and geographic regions.[7]

[7] - Lamia Makhloufi, op.cit. p 178.

Accordingly, China has established a group of multilateral banks namely: the Asian Infrastructure Investment Bank (AIIB), the New BRICS Development Bank (NDB), and the Silk Road Fund, to finance "the Belt and Road Initiative."

Regarding the scope of extension of the Initiative, it aims to connect China with the three mentioned continents through ports, highways, telecommunications networks and railways along two corridors:

- **The First Corridor: The Belt "The Overland Corridor":**

Which means the economical belt of the Silk Road, that runs from China then connects it with Middle Asia, Russia, Turkey, Europe and the Mediterranean Sea, it contains 6 connected corridors namely:[1]

1- The New Eurasian Land Bridge: It extends from the Chinese coastal cities of "Lianyungang" and "Rizhao" to "Rotterdam" in the Netherlands, via a railway line stretching 10800 kilometers from China through Kazakhstan, then on to Russia, Belarus, Poland, Germany, the Netherlands and Belgium"

2- The China, Mongolia and Russia Route: It extends from Northern China to Eastern Russia passing through Mongolia.

3-The China–Central Asia–West Asia Corridor: It extends from western China to Turkey, beginning in Xinjiang and passing through Central Asia to reach the Arabian Gulf, the Mediterranean Sea, the Arabian Peninsula, and 18 countries in West Asia (the Middle East).

4- The China–Indochina Peninsula Corridor: It extends from southern China to Singapore, serving as a land bridge connecting China with the Indochina Peninsula—and Vietnam, Laos, Cambodia, Thailand, Myanmar and Malaysia in Southeast Asia.

5- The China- Pakistan Corridor: It runs from Southwestern China to the Gwadar Port in Pakistan, it contains a trade network of highways, railways, pipes lines and fiber-optic cables.

6- The Bangladesh- China- India- Myanmar Corridor: it connects Southern China to India through a network of roads and railways and others.

The main corridors can be illustrated through the following map:

The Second Corridor: The Road Which Means "The Maritime Road Silk Of The Twenty-First Century":

This road or corridor aims to develop the infrastructure of the partner countries and extends through 3 routes namely:

1- The Western Maritime Route: it extends from the China Sea to the Indian Ocean passing through the Arabian Sea and the Red Sea, then reaching the Mediterranean Sea.

2- The Southern Maritime Route: it extends from the southern China Sea to the Pacific Ocean.[2]

3- The Polar Silk Road: Announced in January 2018, this route reflects China's aim to establish maritime corridors through the Arctic; it is expected to shorten shipping times to Europe by up to 20 days compared to the traditional route through the Suez Canal, which takes approximately 48 days.[3]

3. 3 The Initiative's Objectives and Ambitions:

The Chinese President Xi Jinping highlights the nature of China's "winner-winner" policy, emphasizes the benefits of cooperation with China in this huge project, and stresses that China ensures harmony and stability by employing soft power instead of the hard power[1] In a speech delivered at the opening ceremony of the first Belt and Road Forum in Beijing on May 14, 2017, President Xi Jinping stated that the initiative is inspired by the "spirit of the ancient Silk Road," which he described as "a great legacy of human civilization." He emphasized that it embodies the values of "peace, cooperation, openness, inclusiveness, mutual learning, and mutual benefit." According to him, the initiative represents a path of peace, prosperity, innovation, the linking of different civilizations, and the promotion of cultural and people-to-people exchanges through the establishment of economic corridors and cultural cooperation that yield mutually beneficial outcomes for all participating countries.[2]

Regarding the detailed expanded goals of the initiative, China intends to achieve the following objectives:

- Meeting the requirements of China's accelerated economic development, as a strategy to address the problem of the growing surplus in production in basic industries, by improving growth rates in Chinese exports, by finding new markets for Chinese enterprises.[3]

- Build and develop the infrastructure networks that connect the different regions which the road passes through such as routes and railways in order to guarantee the security of Land, sea and air shipping.

[1] - Gwendoléne Chambon, "The Relationship between the European Union and the People's Republic of China: China's Strategy in Europe as an Illustration of European Divisions," on: https://dumas.ccsd.cnrs.fr/dumas
[2] - Hussein Qawadra, op.cit., p 157-158.
[3] - Lamia Makhloufi, op.cit. p181.

- Straits and sea lanes hold significant importance in China's Belt and Road Initiative, as maritime trade is the main driver for sustaining the Chinese economy. Nearly 90 percent of China's total international trade; by both volume and value; takes place via the sea, particularly along the maritime route from the Indian Ocean through Southeast Asia, especially the Strait of Malacca, which remains under the protection and surveillance of the U.S. Navy.[1]

- Enhancing China's energy security is crucial, as the country heavily relies on oil imports from the Middle East and Africa, all of which pass through the Indian Ocean and the South China Sea. Around 80 percent of these imports are transported by sea via the Strait of Malacca. Consequently, the Chinese navy requires reliable logistical chains to resupply food, fuel, and weapons along its sea lines of communication. This necessitates the development of logistical infrastructure at strategic locations in key countries; a strategy known as the String of Pearls.

- Strengthening the global position of the Chinese currency "the Yuan", is another key objective. The use of the Yuan in settling trade transactions between China and the Belt and Road Initiative member countries represents a significant step toward promoting the international circulation of China's national currency.[2]

- Strengthening the position of Chinese technology and telecommunications companies: such as "ZTE" and "Huawei" as it is meant to play a vital role in developing the information and communications technology infrastructure across numerous Belt and Road Initiative countries. This contributes to expanding their operations and increasing their share in the international e-commerce market.[3]

- Preserving the regional sovereignty and enhance the neighborhood relations: China seeks to consolidate ties with its neighboring countries and promote regional stability, based on the perspective that shared economic interests can enhance political and security cooperation among nations.[4]

- Increasing Chinese influence regionally and internationally: Through these massive investments across various continents of the world, China seeks to expand its influence and provide an alternative development model to the Western model, whether in its immediate surroundings or in the Eurasia region, in addition to the African continent and other regions of the world. This has positioned the Belt and Road Initiative as a key instrument of China's soft power, which it seeks to leverage in asserting its peaceful rise as a global power.[5]

As a result, a significant body of literature; particularly from Western sources; expresses concern about China's geopolitical vision under the Belt and Road Initiative, arguing that China intends to establish a new form of economic and political dominance over participating countries They consider that the initiative is continuously evolving, presenting itself as a land and maritime project aimed at connecting continents. It is also viewed as a redefinition of the global map according to Chinese standards and as a projection of China's power in the medium term, especially since its projects are accompanied by the necessary Chinese financing and executed exclusively by Chinese companies.[6]

Therefore, the regional cooperation will extend to include the "shared beliefs and codes of conduct" of the Belt and Road Initiative countries. China seeks to employ soft power to reshape the world through its ideas, aspirations and standards Thus, the concept of a "community of shared destiny" offers an alternative moral framework for Asia; and ultimately for the world; rather than the West socializing China into liberal values, China may instead take the lead in integrating its region and the broader world through Chinese values. It is attempting to align its international development agenda with its security agenda: essentially seeking to purchase security through international development projects.[7]

Third: The "Belt and Road" Initiative A New Approach To Enhance The Sino- Algerian Partnership

3. 1. Algeria's Position and Significance Within the Belt and Road Initiative

[1] - Hussein Qawadra, op.cit., p 162.
[2] - Amira Ahmed Harzali, op.cit., p 80.
[3] - Sharifa Kalaa, op.cit., p 158.
[4] - Hussein Qawadra, op.cit., p 163.
[5] - Sharifa Kalaa, op.cit., p 158.
[6] - Gwendoléne Chambon, op.cit.
[7] - William A. Callahan, op.cit.

Algeria is the largest African country in terms of area "2.381.741 km2", and is considered the gateway to North Africa. It has a coastal strip of 1644 km, and shares 6343 kilometers of land borders with 7 neighboring countries Algeria also possesses substantial natural resources, including minerals and hydrocarbons, as well as large agricultural areas, particularly along the coastal region and the highlands. Additionally, there are land reclamation experiments underway in the vast Algerian desert as in "Oued Souf" Algeria also has a population exceeding 44 million people, making it a large market for Chinese products that are no longer dominated by France and Western countries. Furthermore, Algeria serves as a transit area to the African interior and acts as a connective zone within the geographic and cultural unity of the Maghreb, the Sahel region, and West Africa. It also has a coastline along the Mediterranean Sea, positioning it as a trusted partner in a significant geostrategic location near Europe. All of this has made Algeria a pivotal hub in the "Belt and Road" initiative due to its position as a linking area between Africa and Europe, coupled with its possession of various strengths and strategic assets.[1]

The concept of partnership, in its general sense, refers to the active connection between two or more parties based on specific criteria imposed by the particular interests of each party in order to achieve common goals. This definition applies to Algeria and China.

From China's perspective, there are three main driving forces or major motives underpinning its relationship with Algeria, as well as the necessity to include Algeria in the "Belt and Road" Initiative, which are:

1- Strategic motive: Algeria is considered a trusted partner in a significant geostrategic location close to Europe, as well as providing access to the coast and the Sub-Saharan region, particularly through the Trans-Saharan highway. This makes it an important hub for the Belt and Road Initiative, as China seeks to control vital territories to assert its international standing.[2]

2- Economic motives: Algeria offers numerous opportunities for China's ongoing pursuit of raw materials necessary to sustain the growth of its economy. China also aims to expand its control over the African market to promote its low-cost goods, as well as to broaden the presence of its investment bases and companies in Algeria across various sectors, especially infrastructure, hydrocarbons, and minerals. As a result, Algeria has become a key arena for government contracts and commercial opportunities for Chinese companies

3. Geopolitical Motive: China has benefited from Algeria's political influence in the Mediterranean region and within the African Union, as part of its efforts to secure African diplomatic support in the face of Western pressures on various issues such as human rights, Taiwan, and democracy. Moreover, China has relied on Algeria and other African countries to promote the Belt and Road Initiative, which continues to face criticism from Western powers.[3]

Regarding Algeria's partnership with China, it is relied on a set of key motives summarized as follows:

- The inevitability of economic emergence and diversification of the Algerian economy, which is heavily dependent on the hydrocarbons sector.

- The reliance on Chinese companies for the construction of infrastructure such as roads, ports, railways, airports, and more.

- Benefiting from incoming Chinese investments and transferred technology.[4]

- Diversifying its trade partners and reducing its dependency on Western powers; mainly France; known for its historical and colonial legacy in Algeria and Africa.

In this context, the Algerian Minister of Transport and Public Works stated in 2018: "We are pleased to join the initiative through which China will share its expertise and knowledge with the African continent, including Algeria, as part of a global development process".[1]

[1] - Ben Djeddou Mohamed Al-Sharif, op.cit., p 25.
[2] - Guendouz Aicha, "The Role of the New Silk Road in the Development of Algerian Foreign Trade: An Analytical Approach to Sino-Algerian Relations," Journal of the Economic Researcher, Algeria: Bordj Bou Arreridj University, Volume 08, Issue 02, 2020. p 128.
[3] - Khallaf Mohamed and Tawil Nassima, "Belt and Road Initiative in Africa: Challenges and Stakes", Al- Mofakkir Magazine, Algeria: University of Biskra, Volume 17, Issue 01, 2022. pp 118-119.
[4] - Hanina Rajouh and Atiqa Kouachi, op.cit., p 221.

So from an Algerian perspective, the country sought to join the initiative in order to take advantage of the opportunities it offers to protect its interests, achieve economic development and economic independence, and play a leading role in the region.

3. 2 Opportunities and Key Challenges of The Sino-Algerian Partnership Within The Framework of The "Belt And Road" Initiative:

Following the signing of the Comprehensive Strategic Partnership between China and Algeria in 2014 for a 5 year period; later renewed in 2019 alongside Algeria's official accession to the "Belt and Road" Initiative; both parties have demonstrated a clear commitment to expanding their areas of cooperation. As a result, China accelerated its efforts to develop the infrastructure necessary for the new Silk Road in Algeria through large-scale development projects. By 2021, the value of direct Chinese investment had reached $10 billion, while annual trade between the two countries amounted to $9 billion. According to official Algerian data, China remains the leading supplier of goods to Algeria.[2]

This highlights the significance of both countries in each other's economic calculations, as reflected in their mutual official statements. Algerian President Abdelmadjid Tebboune described China as a "strong partner and a diplomatic priority" during the visit of Chinese Foreign Minister Wang Yi in July 2021. President Tebboune called for enhanced cooperation with China, particularly in the areas of economy, trade, investment, energy, mining, and infrastructure construction.[3]

In return, Wang Yi stated: "China will continue to regard Algeria as an important partner in promoting unity and cooperation among developing countries under the new circumstances" He also pledged that China would work to translate the mutual political trust between the two countries into tangible outcomes through cooperation, and would support Algeria in accelerating its industrialization and enhancing its capacity for independent development".[4]

Accordingly, the two countries seek to jointly build the Belt and Road on the basis of mutual cooperation, shared benefits, and mutual trust. The two countries are also working "to strengthen cooperation with other participant states in the initiative and to support their advancing economic development. This includes promoting mutual exchange and support in line with the Initiative's principles of cooperation, development, and mutual benefit, by making full use of existing bilateral and multilateral cooperation mechanisms that bind the parties involved".[5]

In this context, China has secured numerous large-scale investments in Algeria, effectively "reshaping the balance of influence"; particularly that of France; Economic experts argue that Algeria has begun selecting its partners based on the principle of "those who offer the most reliable win-win principle".

The most significant projects are the following:

- One of the most significant projects is the large-scale iron ore exploration at the Gare Djebilet mine, located in the far southwest of Algeria, specifically in the Tindouf province. China secured the agreement for this project in April 2022. Described as the "project of the century", it is estimated to cost $2 billion and is expected to generate substantial revenues for Algeria ranging between $10 and $16 billion annually. This project holds the potential to help Algeria break free from its "dependence on oil." The project was carried out through a partnership between the Algerian Iron and Steel Company 'FERAL' and three major Chinese companies specializing in mining exploration and exploitation, in accordance with the 49/51 investment rule.[6] The mine's grey ore reserves are estimated at between 3 and 3.5 billion tons, spread across 3 exploitation zones: "Gare Djebilet West", "Central", and "East.".

[6] - "Gare Djbilet... A Chinese investment awakens the sleeping iron giant in Algeria," on: https://al-ain.com/article/algeria-china-gare-djebilet-mine-investment

- Construction of the Largest Port in Africa: El Hamdania Port As part of China's efforts to realize its ambitious Belt and Road Initiative, the Chinese government has prioritized the maritime corridors of the initiative, having proven to be the safest routes for global trade compared to land routes. In this context, China has focused on implementing one of its largest strategic projects near the city of Cherchell in Tipaza Province.[1] The project, which began in May 2021 as a joint Algerian–Chinese venture, aims to build the largest port in Africa and the Middle East within the framework of the Belt and Road Initiative. With an estimated cost of $6 billion and a projected completion timeline of 7 years, the port is designed to integrate Algeria into the global trade network. It will be connected to a network of railways and the Trans-Saharan Highway – Algeria/ Lagos– a China-led project that extends deep into the African continent.[2]

The Algerian authorities have described it as the "lifeline of local and African development", with a strategic objective that goes beyond Algeria's borders aiming to break the isolation of landlocked African countries and transform Algeria into a global industrial hub The port consists of 23 docks and is designed to handle 6.5 million containers, with a total capacity of 25.7 million tons annually. It will also be capable of accommodating the world's largest ships, with a capacity of up to 240 thousand tons.[3]

- A project to build the largest phosphate plant in Tebessa was signed in March 2022 between "ASMIDAL", a subsidiary of the Algerian oil group "SONATRACH", and the Chinese company "CITIC". The project has an estimated cost of $6 billion. The Algerian government expects the plant to generate annual revenues of up to $1.9 billion and reach a production capacity of 10 million tons per year. The project is also expected to contribute to strengthening the Algerian economy.[4]

- A project to activate investment in the production and marketing of trucks was launched in partnership with the National Company for Industrial Vehicles in Rouiba, with a commitment to ensuring gradual local integration into the product.

- A project for the production of electronic payment terminals has been launched as a joint venture between the National Company for Electronic Industries "ENIE" and the Chinese firm "ZTE"

- A project for the development and exploitation of marble and tile quarries is being carried out in partnership with the public industrial group Mines of Algeria.[5]

In May 2022, China inaugurated another project in Algeria's petrochemical sector, valued at approximately $500 million. Through this initiative, Algeria seeks to elevate its petrochemical export revenues to $5 billion. The agreement was concluded between SONATRACH and the Chinese consortium LPEC/CNTIC. The contract entails the establishment of a production facility for "Methyl Tertiary Butyl Ether MTBE", an additive utilized in the manufacture of unleaded gasoline; a fuel whose nationwide adoption was mandated in Algeria starting in 2020.[6]

These projects illustrate the strengthening of Algerian-Chinese partnership, which has been further reinforced by Algeria's accession to the Belt and Road Initiative. This development underscores the depth and continuity of the bilateral relationship, as well as the high levels of mutual trust in the implementation and execution of joint development projects. Within a rapidly evolving international environment, Algeria's accession to the Chinese initiative represents a strategic step aimed at aligning with the dynamics of this shifting global context.

However, despite the positive aspects offered by the initiative; such as the strengthening of their strategic relations and the economic benefits it brings; the Belt and Road Initiative and the Sino-Algerian partnership face a number of challenges that may impact their future. Among the most significant of these challenges are the following:

[1] - Ahmed Ezzi and Wafia Tidjani, op.cit. p 400.
[2] - Yahyaoui Abdelhafid et al, "Opportunities for Algeria to join the Belt and Road Initiative, the case of Al- Hamdania Port," **Al-Riyada Journal of Business Economics,** Algeria: University of Chlef, Volume 08, Issue 01, January 2022, p 215.

[3] - Younes Bournane, "In numbers how the Chinese dragon ended the legend of France's backyard in Algeria,"op.cit.
[4] -"Algeria signs a $6 billion agreement with China to build a phosphate plant.", on: https://al-ain.com/article/algeria-china-phosphate
[5] - Ahmed Ezzi and Wafia Tidjani, op.cit. p 398.
[6] - Younes Bournane, "In numbers how the Chinese dragon ended the legend of France's backyard in Algeria,"op.cit.

- International Competition: One of the primary challenges facing the Belt and Road Initiative and the Sino-Algerian partnership is the intensifying international competition over Africa in general and Algeria in particular. Notably, France continues to employ various means to preserve its influence in Algeria, this last remains one of the most strategically significant and sensitive regional frameworks from the French perspective. Historically, France's policy toward Algeria has served as an indicator of its international standing. Consequently, a French withdrawal from Algeria would signify a decline in the French economy, as it would lose access to vital natural resources and key markets for many of its products.

Moreover, French influence in Algeria is particularly evident through culturally and politically Francophile elite that seeks to shape public opinion and national policy in line with the orientations of the French administration. This influence is further entrenched through the widespread use of "the French language", which serves as a vehicle for cultural dominance and positions France as a soft power counterweight to Chinese expansion. In contrast, China lacks comparable instruments of influence, particularly in terms of effective cultural outreach and strategic communication.[1]

- The Rise of Sinophobia: The growing phenomenon of Sinophobia, fueled by direct and often tense interactions between the local Algerian population and Chinese laborers, poses another significant challenge. These frictions have at times escalated into physical violence against Chinese nationals, as exemplified by the incidents in Bab Ezzouar in August 2009.

- Concerns over the Practices and Performance of Chinese Companies Operating in Algeria; There are growing concerns regarding the conduct and business practices of Chinese firms active in the Algerian market.[2] China's model of state capitalism is, in some circles, perceived as a form of "neo-colonialism," particularly in light of Algeria's weak industrial base and the overwhelming presence of Chinese goods in its domestic markets. Additionally, Algeria's continued near-total dependence on the hydrocarbons sector for export revenues; particularly in its trade relations with China; the absence of sufficient productive diversification, essential for achieving self-sufficiency across various goods and services, remains a major obstacle to the emergence of a competitive and dynamic Algerian economic and commercial presence at both regional and international levels[3] Consequently, the partnership between Algeria and China risks becoming confined; much like Algeria's traditional partnerships with Western powers; to a pattern in which Algeria serves primarily as a market for Chinese goods and a key supplier of raw materials and hydrocarbons.

- Global Crises: Global crises; regardless of their nature; constitute a significant challenge to the Belt and Road Initiative. Such disruptions may impact Algeria's long-term ability to benefit from the initiative and cast doubt on the resilience and sustainability of the Sino-Algerian partnership.[4]

Conclusion

Based on what was stated in this study and after clarifying the nature and level of the relationship between China and Algeria, as well as an analysis of the 21st-century Belt and Road Initiative and Algeria's positioning within it, we reached the following results:

- There is a complementarity between the Algerian and Chinese perspective and strategic orientations, rooted in the historical depth of their bilateral relations; founded on cooperation, mutual respect for national sovereignty, and non-interference in internal affairs. Both nations share a legacy of having been subjected to colonialism and foreign domination, which has contributed to the evolution of their ties into a strategic partnership. This stands in stark contrast to the approach adopted by many Western countries, which continue to engage with developing nations through a strategy that reflects a "purely colonial" orientation.

- The Belt and Road Initiative represents a strategic milestone in the development and strengthening of the Sino-Algerian partnership, particularly if both parties remain committed to pursuing mutual benefit and fully leveraging the opportunities this cooperation presents, through the two parties' affirmation that their trade and economic relationship is based on the "win-win" principle.

[1]- Kadri Hussein and Birem Fatima, Africa's Position in French Foreign Policy, Algeria: Human Security Laboratory: Reality, Challenges and Prospects, 2019.
[2]- Hanina Rajouh and Atiqa Kouachi, op.cit., p 227.
[3]- Ibid, p 222.
[4]- Khallaf Mohamed and Tawil Nassima, p 128.

- Algeria's accession to the Belt and Road Initiative is expected to consolidate a comprehensive partnership between the two countries and significantly contribute to the realization of major investment projects; particularly in the energy and public works sectors. In the long term, these developments are likely to generate substantial benefits for both the Chinese and Algerian sides China is pursuing a set of objectives not only in economics and politics through this partnership, with particular emphasis on the economic dimension. This focus stems from its awareness of the critical importance of securing access to primary resources to sustain its resource-intensive economy. Moreover, economic engagement is viewed as essential to achieving its desired international standing, especially in light of the intensifying strategic rivalry with the United States Conversely, Algeria seeks to maximize the benefits it can derive from the initiative in order to strengthen its economy and enhance its regional and international competitiveness. The Belt and Road Initiative indeed presents a promising alternative for integrating the Algerian economy more effectively into the global economic system; especially in light of the shortcomings and failures of all previous regional partnership frameworks. Therefore, it is looking for an economic alternative aiming to achieve a real cooperation and partnership in several fields. However, Algeria must not content itself with merely serving as a transit corridor for international trade. Rather, it should prioritize its national interests by formulating strategic plans aimed at economic diversification, escaping the trap of hydrocarbon dependency, strengthening the national industrial base, as well as developing the other economic sectors.

Consequently, if both parties are to ensure the sustainability and further development of their strategic partnership in the future, it is essential that they intensify joint efforts to overcome the key challenges confronting this cooperation; particularly international competition. This can be achieved by focusing on vital and forward-looking sectors, most notably collaboration in the field of renewable energy and the enhancement of cultural and civilizational exchange; an area that continues to receive considerable emphasis from traditional Western powers active in the region.

Acknowledgment and Conflict of Interest

Acknowledgment

The authors would like to express their sincere gratitude to all institutions, colleagues, and experts who contributed to the completion of this research. Special thanks are extended to the editorial team of the journal *Science, Education and Innovations in the Context of Modern Problems* for their constructive feedback and guidance during the preparation of the manuscript. The support from research laboratories, universities, and academic networks has been invaluable in shaping the quality and depth of this work.

Conflict of Interest

The authors declare that there is no conflict of interest regarding the publication of this paper. All authors confirm that they have no financial, personal, or professional relationships that could inappropriately influence or bias the content of this manuscript.

Keywords Orientalism, Orientalist Schools, Classification, Characteristics.

Abstract

Orientalism is a term that denotes an inclination towards the East. Representing an intellectual school characterised by diverse features and motivations, it is challenging for researchers to grasp its complexities. This school has given rise to various sub-schools resulting from the long-standing conflict between two distinct civilisations: Islamic civilisation and Western civilisation. Against this backdrop, this research paper aims to present models of opinion on the classification of Orientalist schools and outline their characteristics using a descriptive methodology. Furthermore, it seeks to identify the classifications proposed by researchers for these various Orientalist schools, as well as their distinguishing features. The main findings reveal that, despite their differing orientations and characteristics, all these Orientalist schools address the issue of the Islamic East.

Introduction:

All praise is due to Allah, Lord of the Worlds. Peace and blessings be upon the noblest of Messengers, his family, companions and all who follow them with righteousness until the Day of Judgement.

Orientalism is a movement that emerged from the conflict between the East and the West, driven by the desire for one side to dominate the other militarily, economically, culturally and ideologically from ancient times to the modern era. Orientalism has played a significant role in the life of the Islamic nation for centuries, with Orientalist schools acting as a bridge between East and West. They have engaged in Orientalist research across various aspects of Islamic civilisation, including cultural and civilisational studies. Consequently, Orientalist schools have emerged, particularly in Europe and more broadly in the Western world, focusing on the study of the East and its civilisation and culture. Each school has concentrated on specific aspects of Islamic thought and heritage, including scientific, philosophical, linguistic and religious dimensions.

However, the existence of these Orientalist schools does not negate differences among researchers and thinkers in their classification and categorisation. Each group has its own classification and perspective, differing from others based on their epistemological foundations and subjective and objective inclinations. This article aims to introduce these classifications, emphasising the most well-known and commonly discussed one among researchers, while also highlighting the key characteristics that define each Orientalist school.

Thus, the research problem can be formulated as follows: To what extent do researchers differ in their classification of Orientalist schools? What characteristics distinguish each Orientalist school from the others?

Conceptual foundation:

Before delving into the formulation of the research, we will establish it conceptually by defining Orientalism both linguistically and terminologically. This will be followed by an examination of how researchers have classified these Orientalist schools.

First: The concept of Orientalism

1. Orientalism linguistically:

It is said that 'the East' refers to the light that enters through a crack in the door. The phrase 'the sun rose' means that it has risen and spread its light upon the earth[1]. Some modern linguistic sources state that 'to orient' means to seek knowledge of the East and its languages[2]. According to the Al-Mawrid dictionary, 'the sun rose' means it has come up[3].

2. Orientalism Terminologically:

Orientalism is a general concept typically applied to an intellectual trend concerned with the study of the cultural life of Eastern nations, particularly Islam and Arab civilisation[4]. According to Edward Said, orientalism is a branch of knowledge that systematically explores the East, considering it a subject for learning, discovery and application[5].

Classification of Orientalist Schools:

Researchers have differing opinions on how Orientalist schools should be classified. Some have considered a thematic classification, listing Orientalists according to their academic specialisms. Others have focused on Qur'anic studies, studies of the Sunnah, and the biography of the Prophet Muhammad (peace be upon him), or the history of the Arabs and Islam[6]. Classifications based on ideological schools and religious trends have also been proposed. However, most researchers have classified these schools according to geographic affiliation.

First: Classification of Orientalist Schools Based on Specialisations

1. Dr Hussein Al-Harawi classified Orientalists based on their specialisms into the following three schools:

- The school specialising in Quranic studies.

- The school specialising in the life and biography of the Prophet Muhammad (peace be upon him).

- The school specialising in Arab history[7].

[1]- Muhammad Murtada al-Zubaidi (d. 1205 AH/1790 CE), The Bride's Crown from the Jewels of the Dictionary, Study and Verification by Ali Bushri, Dar al-Fikr, 1994, Vol. 13, p. 237.
[2]- Ahmed Reda, Dictionary of the Body of the Language, Maktabat al-Hayat, Beirut, 4th ed., 2005, Vol. 8, p. 64.
[3]- Ibrahim Mustafa et al., The Concise Dictionary, Dictionary of the Arabic Language, Cairo, n.d., Vol. 1, p. 482.
[4]- Adnan Wazzan, Orientalism and Orientalists: A Point of View, n.p., p. 15.
[5]- Aqila Hussein, The Muslim Woman and Orientalist Thought, Dar Ibn Hazm, Beirut, Lebanon, 1st ed., 2004, p. 35.
[6]- Muhammad Farouk al-Nabhan, Orientalism: Its Definition, Schools, and Effects, Publications of the Islamic Organization for Education, Science and Culture - ISESCO, Rabat, Morocco, n.d., 1433 AH/2012 CE, p. 21.
[7]- Al-Ziyadi Muhammad Fathallah, Orientalism: Its Goals and Methods – An Applied Study on the Approach of Westerners in Studying Ibn Khaldun, n.p., n.d., p. 69.

However, this classification lacks clarity as it confines Orientalism to the Islamic aspect. It is impossible to find an Orientalist school that focuses solely on the life of the Prophet without also addressing the Qur'an, and it is impossible to separate Arab history from its Islamic context. Consequently, some Orientalists may belong to all three of the schools proposed by Al-Harawi, and many have also shown an interest in Arabic literature and language.

2. Dr. Najib Al-Aqqiqi divided Orientalism into two schools:

- The political school examines literature in its broadest sense.

- The archaeological school focuses on artefacts[1].

However, this classification is inadequate as Orientalist schools engage with various fields and cannot be limited to the political and archaeological realms. In his book The Orientalists, Al-Aqqiqi dedicates a significant portion to studying Orientalists based on geographic schools, indicating his belief in the geographic distribution of Orientalists. He later favoured this classification over others.

Furthermore, the classification based on specialisations proposed by some researchers is not without its challenges. This classification is difficult to implement precisely for two reasons:

- Most Orientalists have written on overlapping topics, making it challenging for researchers to categorise them accurately due to the interconnectedness of Islamic sciences.

- According to this thematic classification, it is difficult to assign specific characteristics to each Orientalist school because each school includes a large number of Orientalists whose methodologies, orientations and inclinations differ significantly due to the diverse nature of the peoples they study. This complexity has led some researchers to classify Orientalist schools based on the affiliations of their members[2].

Secondly, Orientalist schools can be classified based on the religious inclination or ideological school of the Orientalist.

Some researchers have proposed this classification, dividing Orientalist schools into four categories:

1. The Christian School: This school has two branches:

- Catholicism;

- Protestantism.

Although they differ in some doctrinal opinions, these two branches converge in their works and objectives.

2. The Jewish School: This school has specific goals that serve global Jewish agendas[3]. One of the most prominent Jewish Orientalists is the British scholar David Samuel Margoliouth, who initially studied Greek and Latin before turning his attention to Semitic languages. His writings are characterised by bias and a significant lack of objectivity. Another notable Jewish Orientalist is Louis Bernard, who specialised in Islamic history and served as director of Jewish and Middle Eastern Studies in Philadelphia, Pennsylvania. He also offered advice to the US Congress on multiple occasions.

The openness of Orientalist schools paved the way for Jews, both from the diaspora and from Israel, to establish their own Orientalist school. This is known as Jewish Orientalism and later became the foundation for Israeli Orientalism[4].

3. The General Atheistic School:

[1]- Same reference, pp. 69-70.
[2]- Mohammad Farouk al-Nabhan, Orientalism: Its Definition, Schools, and Effects, p. 21, previous reference.
[3]- Abdul Rahman Habannaka al-Maidani, The Three Wings of Deceit and Their Hidden Aspects: Evangelism, Orientalism, Colonialism, Dar al-Qalam, Damascus, 8th ed., 1420 AH - 2000 CE, pp. 126-127.
[4]- See: Wasit University, Roots of Jewish Orientalism, website: https://lark.vowasit.edu.iq >view, date retrieved: 04-08-2025, time: 21:00.

Members of this school are Western Orientalists who are atheists. They aim to promote atheistic thought and establish materialistic concepts of life that deny the existence of God. These individuals hold various social, political and economic views[1].

Notable characteristics of the atheist Orientalist school include:

- Materialism

- Denial of the unseen

- Interpreting religion as a social phenomenon

- Critique of Islam

- Support for secular and atheist movements.

4. The Communist Atheistic School:

This school consists of communist Orientalists who aim to promote atheism and communism, and encourage Islamic peoples to adopt these ideologies[2].

This classification appears to be more precise and widely accepted than the previous one. However, classification based on geographic affiliation remains the most prevalent.

Third: Classification of Orientalist Schools Based on Geography:

This classification has been adopted by most researchers, as the geographic classification approach is easier for categorization. It helps in extracting the characteristics, orientations, positions[3], and areas of interest of each school. Below is a reference to some European schools, considering them the oldest in the field of Oriental studies.

1. The French Orientalist School:

The beginnings of French Orientalism may closely resemble individual attempts and works that blend science with superstition and myths, along with a vague image of the Eastern world. French connections to the East began when the Muslim Arabs opened some of its provinces[4]. Specifically, the Arab-Islamic interaction with France started in the second century Hijri (the first half of the eighth century CE), when Arab military activity began penetrating Europe from Andalusia. One notable manifestation of this interaction was the Battle of Tours in 732 CE[5].

Historians agree that the true phenomenon of Orientalism began with French monks who learned Arabic in Andalusia. In the name of religion, Western politicians united with the Church and spoke with one voice against Islam. Therefore, French Orientalism inherently carries the nature of religious conflict, and most French Orientalists express an ancient root of deep-seated animosity. It has been noted by one scholar that he has not encountered a Protestant Orientalist who dealt with Islamic heritage in a hateful Catholic manner. Thus, most researchers concur that the first Orientalist who cared about Islam and Muslim issues was French[6].

According to Orientalist Johan Foucault, the origins of French Orientalism can be traced back to the Congress of Vienna in 1311 CE. In the twilight of his life, Pope Louis enacted a law affecting five European universities: Paris,

[1]- Abdul Rahman Habannaka al-Maidani, The Three Wings of Deceit and Their Hidden Aspects: Evangelism, Orientalism, Colonialism, pp. 126-127.

[3]- Mohammad Farouk al-Nabhan, Orientalism: Its Definition, Schools, and Effects, p. 22, previous reference.
[4]- Walid Kadhim al-Khashan, The French Orientalist School: A Study of Its Style and Methodology, n.p., n.d., p. 34.
[5]- Salma Hussein Alwan al-Mousawi, The Historical Development of French Orientalism Until the Twentieth Century, Majallat Kulliyat al-Jami'a al-Islamiyya, Kulliyat al-Adab, Iraq, n.d., p. 92.
[6]- Shayeb al-Door Muhammad, French Orientalism and Popular Heritage in Algeria, a thesis for a Master's degree, Department of Arabic Language and Literature, Faculty of Arts, Languages and Arts, University of Oran, 2010, pp. 34-35.

Oxford, Bologna, Salamanca and the papal central administration. This law mandated that professors teach students Eastern languages, including Arabic, Hebrew, Greek and Chaldean[1].

Historically, French Orientalism is considered one of the oldest and most significant Orientalist schools. Chairs in Eastern languages were established in Paris and at the Collège de France in 1539[2]. Some scholars argue that French Orientalism began with the Church's decision at the Vienna Council in 724 AH (1312 CE), which included establishing chairs for Eastern languages (Arabic, Greek, Hebrew and Syriac) at the University of Paris and other European universities[3].

The French continued to seek the intellectual enlightenment of the East through missions, including one led by Princess Elisabeth, cousin to King Louis of France. This mission aimed to learn about Eastern culture and disseminate its sciences[4].

2. The Italian Orientalist School:

Some researchers trace Italy's connection to Orientalism back to before the birth of Christ due to its geographical proximity to Arab and African countries[5]. The connection between Italy and the Islamic world was particularly strengthened during the reigns of King Roger I and his grandson, Frederick II. However, others argue that Italy's official interest in Eastern studies began in the eleventh century, with the first such studies commencing at the University of Naples in 1076 CE, followed by other universities[6].

Nevertheless, these studies did not develop significantly until the nineteenth century, when the Italian Society for Oriental Studies was founded in 1871. From that point on, Orientalism took on political, economic and cultural characteristics, paving the way for the invasion of Libyan territories in 1912[7].

3. The Spanish Orientalist School:

Spain has close historical ties with the Islamic and Arab worlds, as Arab and Islamic civilisation spread throughout Andalusia and remained there for over five centuries. This historical context enabled Spanish orientalists to study the history of Arabs and Muslims, as well as their influences[8].

Therefore, Spanish interest in the East is a natural consequence of Spain's historical experience, which resulted in a substantial body of scientific material, providing the primary motivation for Spaniards to engage with and specialise in Eastern sciences[9].

The establishment of Arabic schools in Spain dates back to the mid-thirteenth century CE. However, the Orientalist movement in Spain reached its peak in the nineteenth century, spearheaded by Michael Asín Palacios[10], the founder of the renowned 'Andalusian' Orientalist journal. Notable libraries housing valuable collections of Arabic and Islamic manuscripts include the Escorial Library and the National Library in Madrid.

4. The British Orientalist School:

[8]- Same reference, p. 56.
[9]- Al-Ziyadi Mohammad Fathallah, Orientalism: Its Goals and Methods, p. 91.
[10]- Spanish Orientalist, born in Zaragoza in 1871, completed his secondary education at a Jesuit school, then joined the seminary. He continued his studies there until he graduated as a priest and began his priestly work in 1895 at the Church of San Catano, passing away in 1944. See: Abdul Rahman Badawi, Encyclopedia of Orientalists, Dar al-'Ilm lil-Malayeen, Beirut, Lebanon, 3rd ed., 1993, pp. 121-126.

The study of Arabic language and literature by British scholars dates back to the Middle Ages. Notable figures include Edward Pococke[1], who translated the works of Greek philosophers. The first chair in Arabic studies was established at the University of Cambridge in 1623, followed by the first such chair at the University of Oxford in 1626[2].

These developments demonstrate the ancient nature of English connections to the East, which can be traced back to the years before Islam. Some sources state that relations were established between Ireland and the East as early as the mid-third century CE, when some monastic travellers went to Egypt, Syria and Palestine en route to the Holy Land. Nevertheless, English writings about the East did not emerge until the first century Hijri, when Willibald wrote about his travels to Arab lands, followed by other pilgrims and traders[3].

The Church played a significant role in encouraging Oriental studies during the tenth, eleventh and twelfth centuries, with the Pope advocating the study of Eastern sciences and civilisations. Napoleon's campaign was perhaps one of the most direct and influential factors in promoting Oriental studies. The University of Oxford is considered to be one of the first English universities to establish a department for Oriental studies, followed by a department for Arabic and Islamic studies in 1636 CE[4].

The British Museum Library in London developed an interest in Eastern heritage, incorporating the libraries of various consuls who had worked in Cairo, Baghdad, Muscat and Damascus. The library amassed a vast collection of Eastern artefacts, including manuscripts, documents, Qur'ans and dictionaries[5]. Other English universities also began establishing departments for Oriental studies, subsequently creating affiliated schools and colleges in Africa, Arab countries and other Islamic regions, including India and Pakistan[6].

Initially, British Orientalism had a religious character, but in later periods it took on a pronounced colonial political direction, aiding the spread of sectarian studies. British Orientalists worked in all fields that served British colonial interests, including for the British East India Company[7].

5. The Dutch Orientalist School:

The connection between the Netherlands and Orientalism dates back many centuries, with Leiden University being one of the most renowned institutions to contribute to Orientalist thought in Europe. The university's famous printing press was established by the Orientalist Thomas Erpenius[8], to whom Oriental studies owe a significant debt. The press published the Islamic Encyclopedia in both its old and modern editions[9], as well as an indexed dictionary of hadith terms[10].

The Oriental Society was founded in Leiden in 1920 and collaborated with Danish and Norwegian Orientalists to publish a scientific journal called Eastern Works. Leiden University's library contains precious manuscripts that Dutch Orientalists spent centuries collecting[11]. Many Orientalists, including Hamaker, Dozy, de Jong and Keenan, catalogued these manuscripts.

[1]- Edwards A. Bath: A British Orientalist, among his works are The Nile and Political and Economic Statistics about the Middle East, London, 1950. See: The Orientalists Najib al-'Aqiqi, Dar al-Ma'arif, Cairo, 4th ed., Vol. 2, p. 490.
[2]- Hassan Ali al-Hashemi, A Critical Reading of the History of the Qur'an by the Orientalist Theodor Nöldeke, previous reference, p. 55.

[5]- Najib al-'Aqiqi, The Orientalists, Vol. 2, p. 23.
[6]- Mohammad Farouk al-Nabhan, Orientalism: Its Definition, Schools, and Effects, p. 28.
[7]- Hassan Ali al-Hashemi, A Critical Reading of the History of the Qur'an by the Orientalist Theodor Nöldeke, previous reference, p. 55.
[8]- Born in Gorcom in 1548, graduated in theology from Leiden University, traveled to England, France, Germany, and Italy in search of books and manuscripts. When he returned to Leiden, he was appointed the first professor of Arabic there in 1613, passing away in 1624. See: Najib al-'Aqiqi, The Orientalists, previous reference, Vol. 2, pp. 653-654.
[9]- Saadoun al-Samouk, Orientalism and its Methodologies in Islamic Studies, Dar al-Manahij for Publishing and Distribution, Amman, Jordan, 1st ed., 1431 AH/2010 CE, p. 104.
[10]- Najib al-'Aqiqi, The Orientalists, Vol. 2, p. 650.
[11]- Same reference, Vol. 2, p. 646.

Although Dutch Oriental studies may not match their earlier prominence, they remain in good condition, with current interests focusing on heritage and philosophy[1].

6. The German Orientalist School:

German connections to the East date back to the tenth century CE, when the German emperor Otto sent the priest John as an ambassador to the caliph Al-Nasir in 956 CE. In turn, Caliph Al-Nasir sent one of his own priests as an ambassador to the German emperor[2]. Following the Second Crusade in 1147 CE, German Orientalists began began to pay attention to Islamic civilisation, especially after clergymen started translating Arabic books. Hermann of Dalmatia, a German[3], contributed to the first translation of the Qur'an between 1141 and 1143 CE, although this this translation was not published until four centuries later[4].

Jacob Kremer (1554–1613) was the first German Orientalist to focus on teaching Arabic. He wrote a book on the Arabic alphabet and how to write it[5]. He also compiled a catalogue of Arabic manuscripts and translated parts of the Gospel into Arabic. He prepared Arabic letters in wooden types for the printing press. He proposed establishing a chair in Arabic studies to translate philosophy and medicine from their Arabic sources[6].

Another noteworthy figure is Reiske, who is considered one of the first German Orientalists. A scholar of Greek literature, he dedicated his life to studying Arabic and Islamic civilisation. He translated the introduction to The Calendar of Histories by Hajji Khalifa in 1847 CE and published samples of Arabic poetry[7]. The Orientalist Theodor Nöldeke[8] was a leading figure in Eastern studies in the mid-nineteenth century, while Hartmann founded the German Oriental Society for Islamic Studies, which published the journal The World of Islam. Additionally, Orientalists published several journals on the East and its heritage. The most notable of these is the "Islam Journal", founded by Orientalist Karl Becker[9] and focusing on Arab and Islamic heritage[10].

There are many other schools that cannot be covered here, such as the Russian and American Orientalist schools. The emphasis on European schools is due to their pioneering role in Oriental studies and their comprehensive approach to various intellectual, cultural and religious topics.

Fourth: Characteristics of Orientalist Schools

The French Orientalist School:

The French Orientalist School has distinct characteristics, including:

1. Its studies focus on three main areas:

A. The religious axis

B. The political axis

[1]- Saadoun al-Samouk, Orientalism and its Methodologies in Islamic Studies, p. 105.
[2]- Hassan Ali al-Hashemi, A Critical Reading of the History of the Qur'an by the Orientalist Theodor Nöldeke, p. 69.
[3]- A German Orientalist, a colleague of Robert in his studies and translations, appointed as a pastor at the Church of Sheny, then a bishop in Storja. He classified a book on rhetoric and poetry by Aristotle, aided by Al-Farabi's explanation on rhetoric, influenced by the Arabs. See: Najib al-'Aqiqi, The Orientalists, Vol. 1, p. 124.
[4]- Hassan Ali al-Hashemi, A Critical Reading of the History of the Qur'an by the Orientalist Theodor Nöldeke, previous reference, pp. 68-69.
[5]- Al-Ziyadi Mohammad Fathallah, Orientalism: Its Goals and Methods, previous reference, p. 75.
[6]- Hassan Ali al-Hashemi, A Critical Reading of the History of the Qur'an by the Orientalist Theodor Nöldeke, pp. 69-70.
[7]- Abdul Rahman Badawi, Encyclopedia of Orientalists. previous reference, pp. 298-303.
[8]- Nöldeke is considered the father of German Orientalists, born in Harburg in 1836, studied Arabic and Hebrew and their literatures, as well as as Sanskrit, Persian, and Turkish. He obtained his first doctorate in 1856 with a thesis on the history of the Quran, moved to Vienna and then to Leiden, where he found abundant Arabic manuscripts. His works include History of the Quran and studies on Arabic grammar. See: Abdul Rahman Badawi, Encyclopedia of Orientalists, pp. 595-598.
[9]- He is among the prominent German Orientalists interested in German politics, appointed president of the Institute for Colonial Affairs, held a ministerial position, and was an expert on religious, political, and economic conditions in the Islamic world. See: Abdul Rahman Badawi, Encyclopedia of Orientalists, p. 74.
[10]- Mohammad Farouk al-Nabhan, Orientalism: Its Definition, Schools, and Effects, p. 30.

C. The colonial axis[1].

2. It has had a significant impact on the development of German Orientalism, diverting it towards religious and political themes. This is evident from the fact that many German Orientalists studied under their French counterparts, including figures such as Freitag[2], Flügel[3] and Fleischer[4].

3. Sorbonne University's global reputation clearly had an effect on invigorating Eastern studies in France[5].

4. The Institute of Oriental Languages, founded in 1195 CE, is widely regarded as the most important centre for French Orientalism.

5. Many institutes, schools and cultural centres were established in Eastern countries, significantly influencing the Frenchification of many of these countries, particularly those colonised by France.

6. Orientalism is characterised by specialisation, meaning that most of its members focused on specific aspects of research and study.

7. Most French universities and institutes dedicated to Eastern studies were founded by monks and clergy, who managed these institutions[6].

8. French Orientalism is regarded as the primary European reference point for research and studies related to the Tuareg and Berber peoples. This focus was aided by the concentration of French colonies in Africa, and such studies were not without insidious colonial intentions[7].

9. Many officers from the French armed forces were involved, and their work in French colonies enabled them to excel in various aspects of Eastern studies. Notable figures among them include Jacot[8], Montan[9] and Bershée[10], among others.

The Italian Orientalist School:

The early phase of Italian Orientalism was characterised by a religious focus, which later evolved into colonial objectives. This is particularly evident during the Italian occupations of Libya, Ethiopia and Somalia.

Italian Orientalists established themselves in the East and Arab countries, teaching at scientific institutions and universities, particularly in Egypt. Notable Arab intellectual leaders[11] such as Taha Hussein studied under these Orientalists, including Carlo Nallino[12].

[7]- A Critical Reading of the History of the Qur'an by the Orientalist Theodor Nöldeke, Hassan Ali al-Hashemi, p. 51.
[8]- Jacques: one of the French army officers who engaged in Oriental studies, known for two studies: The State of the Alawites and Antioch as a Tourist Center. See: The Orientalists, Najib al-'Aqiqi, Vol. 1, p. 242.
[9]- Robert Montan: one of the French Orientalists who served in the French army, born in 1893 and died in 1954, held several academic positions including director of the French Institute in Damascus, and left many works including The East and the West and Political Life of the Berbers in Morocco. See: the Orientalists, Najib al-'Aqiqi, Vol. 1, p. 272.
[10]- Léon Berché (1889-1955), a French Orientalist who started as a translator officer, later held several administrative positions in Tunisia, translated The Ring of the Dove by Ibn Hazm. See: Encyclopedia of Orientalists, Abdul Rahman Badawi, p. 91.
[11]- Hassan Ali al-Hashemi, A Critical Reading of the History of the Qur'an by the Orientalist Theodor Nöldeke, pp. 42-43.
[12]- One of the prominent Arabists in Italy, born in Turin in 1872, learned Arabic at his university, specializing in the Arabic language and Islamic civilization, appointed as a professor in Naples, then at the University of Palermo, and later at the University of Rome, where a chair for

- Many female Orientalists were present, including Maria Nallino, Olga Pinto, Angela Codazzi and Esther Panetta. Additionally, Italian Orientalism is characterised by the phenomenon of inheritance, whereby children follow in their parents' footsteps.

There is, however, a noticeable lack of interest in other parts of the East, particularly the Far East[1].

The Spanish Orientalist School:

The Spanish Orientalist School has made significant contributions to the translation and publication of Arabic books, thereby benefiting European scholarship. One of the most renowned translators was Emilio García Gómez.

Spanish Orientalists focused on philosophy, mysticism, history and literature. Prominent figures in this field include Plathius, Raimundo[2] Martini and Father Dario, who produced numerous works[3].

Spanish Orientalism shares many similarities with German Orientalism, particularly in terms of preserving, cataloguing, editing and publishing Arab heritage. However, Spanish Orientalism has the advantage of possessing a significant portion of Arab and Islamic heritage in libraries left by Muslims in Spain.

Although the 20th century saw a clear decline in Orientalist activities, Spanish Orientalism saw some exceptions. Notable scholars such as Asín Palacios wrote around 250 books and papers, some of which are multi-volume works, alongside Juan Talía Blanques[4].

Cataloguing Arabic manuscripts was a major area of interest for Spanish orientalists, with key figures including Pascual Gayangos[5], Salvador Gómez and Alarcón.

- Priests and monks played a significant role in revitalising Spanish Orientalism[6].

The British Orientalist School:

- British Orientalism originated from personal motivations, which later evolved into religious motives aimed at invigorating missionary activities, followed by colonial motives as the English engaged with the East as occupiers.

- The University of Cambridge and Oxford are considered the two most significant places where British Orientalism emerged and flourished.

- Some Orientalists participated in military and diplomatic roles or served as advisors in the British Foreign Office and the Colonial Office[7], including figures like Richard Burton and Watson.

The Dutch Orientalist School:

- The beginnings of Dutch Orientalism were driven by missionary zeal.

- Dutch Orientalism operated within a Catholic papal framework.

- It is characterised by comprehensiveness, depth, novelty and objectivity[8].

---

history and Islamic studies was established for him in 1915, passed away in 1938. His works include A Scene from Egyptian Life and The Formation of Arab Tribes Before Islam. See: Najib al-'Aqiqi, The Orientalists, Vol. 1, pp. 377-380.

Leiden University played a significant role in the inception and development of Dutch Orientalism[1].

The German Orientalist School:

German Orientalism is generally considered to be relatively neutral and distant from political, colonial or religious aims, and does not usually stem from colonial backgrounds. However, this does not imply that German efforts are completely devoid of bias or objectivity.

It focuses on ancient studies, emphasising the study of Islamic Arab heritage and the history of Islamic civilisation.

- German Orientalism has become a reliable source for Qur'anic studies among European Orientalists[2].

Conclusion:

Through exploring various Orientalist schools and their classifications, we can conclude that Orientalism is an attempt to understand the East through a Western lens influenced by religious, cultural and political backgrounds.

Orientalist schools generally address all aspects of Eastern civilisation — political, cultural, social and religious — with a particular focus on Arab and Islamic civilisation. Each school has unique characteristics and orientations that distinguish it from the others. For instance, the French school is noted for its clarity, precision, and comprehensiveness.

Differences among researchers in classifying Orientalist schools stem from their cognitive frameworks, cultural inclinations and convictions. Most researchers prefer geographic classification because it is a practical method that makes it easier to identify the characteristics of each school.

Each school specialises in certain subjects and fields. For example, the French Orientalist school focused on the Arabic language, whereas the British school was more concerned with doctrine and the biography of the Prophet.

Acknowledgment and Conflict of Interest

Acknowledgment

The author wishes to extend sincere gratitude to the Faculty of Islamic Sciences at the University of Algiers 1 for providing the academic environment and support necessary for the completion of this study. Special appreciation is expressed to colleagues and peers who provided insightful feedback during the preparation of the manuscript. The author is also thankful to the reviewers and editorial board of the journal for their valuable comments and constructive suggestions that helped improve the quality of this paper.

Conflict of Interest

The author declares that there is no conflict of interest related to the publication of this article. The research was conducted independently, and no financial, personal, or professional relationships have influenced the results or interpretations presented in this study.

Keywords	Educational leadership styles; classroom climate; social psychology; Lippitt and White experiment; pedagogical facilitation

Abstract

The study investigates the profound impact of educational leadership styles on the psychological and social climate of classroom groups, with particular emphasis on the seminal experiment conducted by Lippitt and White under the supervision of Kurt Lewin. Leadership within the classroom is not merely an organizational function but a determinant of the learners' emotional security, motivation, and cooperative behavior. Drawing on social psychology and pedagogical theory, this paper critically examines how different facilitation styles—authoritarian, democratic, and laissez-faire—shape group interaction, cohesion, and the quality of the learning environment.

Findings from Lippitt and White's experiment provide a valuable empirical framework for understanding how leadership behaviors influence both individual student adjustment and collective classroom dynamics. The democratic style, characterized by participatory decision-making, fosters a supportive psychosocial climate, enhancing engagement, creativity, and responsibility among learners. In contrast, authoritarian styles often create dependency, compliance, and reduced intrinsic motivation, while laissez-faire approaches may encourage autonomy but risk generating disorganization and social fragmentation.

This study argues that the educational leader must integrate modern pedagogical approaches with cultural and societal contexts, balancing innovation with values and traditions. The discussion highlights the need for teacher training programs that cultivate democratic leadership competencies, equipping educators to act not only as knowledge transmitters but also as facilitators of psychosocial development and ethical citizenship. By situating the Lippitt and White model within contemporary educational discourse, the article contributes to a nuanced understanding of how leadership choices determine the overall psychological well-being and social cohesion of classroom communities.

1. Introduction

Teaching through modern approaches has become a strategic choice. This attempt therefore revolves around the most important roles of the teacher and the techniques of his facilitation, as a key feature indicating the degree of their importance at the didactic and pedagogical level. Accordingly, it is appropriate for the teacher to assume new and effective roles that are in harmony with the spirit of democracy and the achievements of modern education, without, however, neglecting the foundations, values, cultural specificities, and national constants of our society. Learning, in fact, is a process that carries both stimulation and difficulty at the same time, and learning styles differ and vary among individuals, which makes the learning process for each person a complex task. In order for curricula and teaching methods to become more effective in producing the desired human being, it is essential to raise the efficiency of the teacher, to improve his competence in teaching, and to train him in effective facilitation—something that cannot be achieved except through a comprehensive understanding of leadership styles and facilitation methods that make the learning process easier for the learner (Al-Sayyid, 1998, p. 27).

Through this paper, I will attempt to answer the following questions: What is the concept of educational leadership within the classroom group? What are the effective leadership styles that influence the psychological and social climate of learners? And what is the model that society aspires to?

First: Terms and Concepts

1. Definition of Leadership

According to Al-Qaryouti (2000), leadership is defined as: *"the ability of a person to influence others in such a way that makes them accept his leadership voluntarily and without any legal obligation, due to their recognition of his role in achieving their goals and his expression of their hopes and aspirations, which enables him to lead the members of the group in the manner he deems appropriate."*

Operationally, leadership may be defined as: *"the ability to influence the behavior of workers, directing them, and motivating them to work in order to achieve the predetermined objectives."*

2. Definition of Educational Leadership

Mohamed Mounir Morsi defines educational leadership as: *"the ability to direct the behavior of individuals in a specific situation, since at its core it is based on the interaction that takes place between the leader and the members of the group"* (Morsi, 1998, p. 34).

It may also be defined as: *"leading the workforce in the educational process, and improving social interaction among its members in an effective way that achieves their cooperation, raising their level of performance to the highest possible degree, while maintaining the structure and cohesion of the group"* (Abouda, 1995, p. 141).

Operationally, educational leadership may be defined as: *"the ability to influence the behavior of learners, to direct them, and to motivate them to exert effort and diligence in order to achieve the intended educational goals."*

3. Definition of Leadership Style

Al-Sharif (2004) defines leadership style as: *"the activity practiced by the leader within the organization to influence the behavior of those working with him, and to make them cooperate in achieving the desired objectives and in improving the level of job performance."*

Hassan and Al-Ajmi (2007) refer to leadership style as the behavior adopted or pursued by the leader in any situation with the aim of achieving the intended objectives, and which subordinates emulate in their own behaviors.

Operationally, leadership style in the framework of this study is defined as the behavior exercised by the educational leader in dealing with learners, which influences their level of performance, their behavior, their respect, their loyalty to him, and their willingness to achieve the desired objectives, as measured through the Leadership Styles Questionnaire.

4. Definition of Educational Leadership Styles

Studies that addressed the behavioral characteristics of the leader and his way of exercising influence over others classified leadership into **three main styles**:

- Democratic Leadership
- Autocratic (Dictatorial, Authoritarian) Leadership
- Laissez-Faire (Free, Non-directive) Leadership

In order to clarify the characteristics of each of these styles, we shall examine them in some detail.

4-1. Democratic Leadership Style

In the democratic style, the leader works to provide opportunities for the workers to carry out the work themselves without intimidation or coercion, but rather on the basis of sound human relations, participation in decision-making, exchanging opinions, and delegating authority to those working with him. Al-Badri (2001) describes it as: *"a human and collective leadership."* Al-Tawil, for his part, characterizes the democratic leader as tolerant and open in his dealings with all employees.

Al-Nimr and others (1997) indicate that democratic leadership is characterized by collective organization. However, this style of leadership requires the leader to trust the workers, to give them space to present their ideas, and to allow them to freely discuss work issues, with the necessity of respecting these ideas and seeking to respond to them (Yaghi, 1996).

Among the most important positives of the democratic style is that it helps in training and preparing future leaders by giving middle leaders the opportunity to discover and develop their abilities. It also raises workers' morale, satisfies their needs, and makes them feel job satisfaction, thus reducing complaints. All of this motivates them toward work with enthusiasm and mastery (Kanaan, 1992).

On this basis, the democratic style can be considered the most effective and successful leadership style in developing and improving the institution and its workers, as it raises their morale, strengthens their belonging to their workplace, and enhances their loyalty to their leader, all of which positively reflects on performance and, consequently, increases productivity. However, the application of this style depends on the leader's own skills, the level of awareness of subordinates, their readiness to participate in decision-making, and their acceptance of the opinions of others. Democratic behavior is not inherited but rather acquired through training and by providing a suitable environment for it.

Assaf (1982) notes that despite the benefits and advantages of democratic leadership, it can sometimes produce negative results; for example, in situations that require urgent decisions, involving workers and consulting them through meetings and getting to know their different points of view consumes time and slows down the decision-making process and the implementation of necessary measures.

4-2. Autocratic Leadership Style

This style is also called authoritarian, despotic, or dictatorial. In it, all authority is concentrated in the hands of the leader, who makes decisions unilaterally, while subordinates must follow instructions without discussion; otherwise, they may face the harshest forms of punishment (Al-Dhahabi & Al-Azzawi, 2005).

Under this style, communication flows only in one direction—from top to bottom—so others cannot deliver their opinions to the leadership, and if such opinions reach the leader, they may be ridiculed or disregarded. The autocratic leader believes he knows better than others what should be done, therefore he does not delegate authority, and he uses coercive methods based on threats and intimidation. He also occupies himself with monitoring every small and large detail of the work.

Some researchers divide the autocratic style into three main forms (Hashim, 1980):

- **The strict autocrat:** all authority is subject to him, and he manages affairs entirely alone.
- **The benevolent autocrat:** occasionally uses some positive methods such as rewards to gain the loyalty of subordinates and avoid their negative attitudes toward him.
- **The tactful autocrat:** creates the impression among subordinates that they are participating in decision-making by holding some meetings and discussions with them, but ultimately he retains sole decision-making authority.

Although the autocratic leadership style may succeed in controlling work and increasing productivity, it has several disadvantages. Al-Najjar (1980) and Al-Nimr et al. (1997) emphasize the following:

- Subordinates dislike their leader, and their morale declines.
- It kills the spirit of creativity and initiative among them.
- Cooperation between the leader and the workers disappears.
- Work performance becomes tied to the leader's presence; once the leader is absent, the work comes to a halt.

4-3. Laissez-Faire (Free) Leadership

This style is known by several names, most commonly free leadership, permissive leadership, non-directive leadership, or chaotic leadership. In this case, the leader is almost entirely absent from the work environment, leaving workers complete freedom to act as they wish. The leader's role is limited to meeting subordinates' needs for resources and information necessary to perform their tasks, without influencing them or exercising authority over them (Yaghi, 1996).

If autocratic leadership neglects the role of subordinates, laissez-faire leadership neglects the role of the leader. Undoubtedly, the absence of the leader's role results in the emergence of competing informal leaders, and leads to feelings of instability among workers.

Abu Samra and others (2003) argue that the laissez-faire style is not leadership at all and does not even rise to the level of leadership. They consider it instead to be *"laissez-faire management,"* since leadership presupposes the exercise of influence over workers—something entirely absent in the laissez-faire style.

However, this style may be appropriate in some institutions such as universities and research centers. Despite the negative consequences of laissez-faire leadership—such as weak cooperation among workers, absence of team spirit, and lack of discipline and organization—it also has certain characteristics. For instance, it gives subordinates the chance to work freely, to evaluate their own performance independently, and to rely on themselves. In addition, it facilitates communication between the leader and the subordinates (Kanaan, 1992).

5. Definition of the Psychological and Social Climate

5-1. Climate in Language

The word *mounakh* (climate) is a relatively recent term in the dictionary. In *Al-Ra'id Dictionary*, the word is derived from *anākh, inākhah (nawkh)*. It is said: *anākh al-jamal* (the camel knelt down), meaning: he made the camel kneel, or he made it settle in a place; it also means to reside there, or to come down with humiliation or otherwise (Masoud, 1981, p. 242).

5-2. Climate in Terminology

The term *climate* includes the organizations, individuals, and groups that benefit from these organizations and interact with them. Climate is the main source from which the organization derives the types of resources necessary for its operations. Moreover, climate encompasses systems and rules that regulate work, organize relationships, and define what is acceptable and what is rejected in terms of types and fields of activity.

The psychological literature points to two dimensions of climate: one is specific to the individual, and the other is related to the systemic (organizational) dimension, that is, the systems and determinants surrounding the individual. Each dimension is intertwined and interacts with the other (Al-Sulami, n.d., pp. 12–13).

5-3. Definition of the Psychosocial Climate

It was defined in the *Dictionary of Psychology* as follows: *"It is the qualitative aspect of interpersonal relationships, which appears as a total sum of the psychological states that either facilitate or hinder productive activities and the comprehensive development of the individual within the group."*

Koys and DeCotiis (1991) defined the psychosocial climate as *"a perceptual phenomenon in which the individual participates widely as a supposed organizational unit, whose primary function is to shape individual behavior in accordance with the requirements of the organization."*

6. Definition of the Classroom Group

The classroom group has been defined in light of its nature, its functions, and its objectives—particularly the role it plays in the affective life of the child (the pupil)—through numerous definitions. For Johnson and Banny (1974), it is defined as: *"a group of individuals who collectively perceive their unity, and who adopt the same behavior toward the school environment."*

Others, such as Dubon (1982) and Journet (1980), define the classroom group through its characteristics and consider it a group of direct interaction, since its members influence one another and because it affects them through the norms that are formed within it. It is an organized work group established to achieve a specific objective. It is also a formal group, because its members were designated to be a group and did not choose it themselves, and because the institution imposed upon them—in the classroom group, as in any small group—a set of variables that generate its dynamics.

These variables can be observed directly or through instruments such as tests, questionnaires, interviews, and role-playing. The classroom, as a psychosocial space, is characterized by being a group that aims, through its very existence, to achieve a specific task under specific conditions. Through its organization, it seeks to fulfill educational purposes and to impart knowledge such as the acquisition of skills and learning experiences, within regulated conditions and according to clear methods and means.

Thus, the essence of the classroom group can only be understood within the framework of the characteristics of the small group, in which work is considered the most important common principle among its members, with the addition of certain features specific to the educational classroom that distinguish it from other forms of organization (Al-Luhiyyah, 2007, p. 64).

Second: Importance of the Topic

The importance of this topic lies in the fact that it addresses one of the fundamental factors influencing classroom dynamics, namely the *style of the educational leader* adopted by the teacher in directing the educational process. The leadership style is not only reflected in students' academic performance, but its impact also extends to the psychological and social climate that prevails in the classroom group, in terms of the level of interaction, the sense of belonging, security, and motivation. Moreover, the reliance of the subject on a pioneering experiment in social psychology, conducted by *Lippitt* and *White* under the supervision of *Kurt Lewin*, adds a scientific dimension that allows for a deeper understanding of the nature of the relationship between leadership styles and the educational climate. This, in turn, contributes to equipping teachers and educators with more conscious and effective practices in improving the classroom climate and preparing learning conditions that support learners' growth (Lippitt & White, 1943, p. 503).

Third: Previous Related Studies

1- The study of Mahmoud Fathi Okasha from the University of Alexandria and Dawood Abdulmalik Al-Hadabi from the University of Sana'a (1991) on the *ideology of classroom control*. This study focused on some methods of classroom management, including leadership styles and teacher personalities. It was based on the study of *Lippitt and White (1943)* in defining two leadership styles: *dictatorial and democratic*.

By the *dictatorial or authoritarian teacher*, the study meant the teacher-centered classroom, in which the teacher maintains high control, the activity is formal or rigid, with minimal participation allowed for students, and communication is centered around the teacher. The *democratic teacher*, on the other hand, is the one who presides over a learner-centered classroom, with more distributed authority, greater independence for the learner, emphasis on students' ideas, concern for divergent thinking, and allowance of high verbal activity for students. Communication is open between the teacher and the students, and among the students themselves. The results of the study indicated that novice teachers at the beginning of their career, as well as student-teachers, were more authoritarian in classroom control. Moreover, high school teachers were found to be more authoritarian than elementary school teachers.

2- The study of *Willower and his colleagues (1967)* on the ideology of classroom control, which focused on the authoritarian style and the humanistic style. The authoritarian style is characterized by concern with maintaining order, lack of trust in students, and the use of punishment to control the class. By contrast, the humanistic style is characterized by viewing students as individuals, providing an atmosphere that allows them to fulfill their desires and needs, and helping them to learn through cooperation, interaction, and the development of self-discipline instead of imposing order upon them.

3- Cheng (1994) emphasized the existence of a strong correlational relationship between the teacher's leadership style in the classroom and the psychosocial climate, as well as between this climate and students' effective performance. In general, personality is determined by social and environmental factors (Pervin, 1980, p. 13).

From the foregoing, it is clear that the two variables, namely ego strength and emotional tranquility, may be influenced by the psychosocial climate, since both are social products. Ego strength expresses sound perception, while psychological security—as emotional tranquility has been called—is the result of experiences and life situations. Hamed Zahran defined the concept of psychological security as emotional or psychological tranquility, explaining it as: *"a state in which the satisfaction of needs is guaranteed and not exposed to danger,"* such as the need for love and affection, the need for safety, physiological needs, the need for self-esteem, and self-respect. Sometimes the satisfaction of needs occurs effortlessly, while at other times it requires striving and exertion to achieve it (Zahran, 1984, p. 297).

Fourth: The Experiment of Lippitt and White on Leadership Styles and Their Influence on Learners' Behavior (the Classroom Group)

The styles of the educational leader and his facilitation techniques related to the act of learning ultimately aim at enabling learners to acquire certain abilities, to develop them, or to correct them, in a way that serves the achievement of the competencies set at the end of a specific program or part of it. Indeed, modern experimental research on authority, leadership, and methods of management and facilitation has, over the last decades, enabled psychologists and educators to identify three principal styles of facilitation, each characterized by its own features and its general outcomes on the productivity, behavior, and performance of groups. Each of these styles has profoundly different effects on the group, and the adoption of any one of them leads to calculated repercussions with respect to the group's work, its efficiency, and its progress toward its goals.

1- The Experiment and Its Field Procedures

(Keeping the French text as it is, without translation, as per your instruction — only ensuring orthographic consistency if necessary):

Cet étude classique réalisée en 1939 par Lewin, Lippitt White sur trois styles de leadership et les différents climats sociaux qui en résultent, à savoir autocratique, démocratique et laissez-faire. Une extension graduelle de la théorie

de champ lewinienne pour inclure des motivations inconscientes dans le comportement individuel et dans le comportement de groupe a permis d'élargir l'influence déjà considérable de cette recherche sur les sciences du comportement. Deux événements récents m'ont incité à écrire cette communication: (1) le 100e anniversaire de la naissance de Kurt Lewin en 1990 (Maccoby, 1992); et (b) un élargissement de la théorie de champ lewinienne pour englober les motivations inconscientes. (Lewin, K, &,1939, 276-278).

Cette théorie du leadership a été reprise par les psychologues scolaires dans la mise au point d'un modèle schématique de l'éducation des enfants. En effet on distingue trois étapes au cours desquelles l'enfant est éduqué de manière paternaliste (interdiction de sortir le soir à 4 ans), puis de manière participative (possibilité de sortir mais négociée avec les parents), et enfin laissé libre (majorité, libre décision de ses actes.

Lewin confirme ces résultats en 1943 avec ses expériences sur le changement d'attitude alimentaire des ménagères américaines. Pour modifier durablement les habitudes alimentaires, il apparaît plus aisé d'en faire découvrir la nécessité aux intéressées au travers d'échanges verbaux. (Manuel, pp. 46-47).

2- Defining the Objectives, Boundaries, and Sample of the Experiment

2-1- Objectives of the Experiment:

- To study the impact of the facilitator's behavior (the teacher) on the behavior of the classroom group (the pupils), whether negatively or positively, when he adopts a particular leadership style: democratic, autocratic, or laissez-faire.

- To study the reaction of the classroom group when moving from one of these climates to another that is different in nature.

2-2- Boundaries of the Experiment:

- **Spatial boundaries:** A primary school.

- **Temporal boundaries:** The year 1943.

2-3- The Sample:

The number of children was 20 pupils from a single class, chosen randomly, all of whom were 10 years old. The classroom group was divided into four clubs, with each club consisting of 5 children and each one given a specific name.

Lippit et White distinguent trois styles de leadership utilisés spontanément par des enfants dans des groupes d'un école primaire:

Models of the Climates Tested on the Groups:

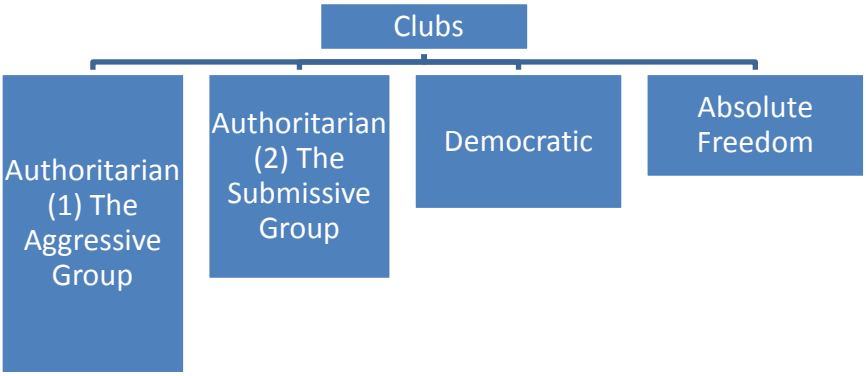

Figure (1) illustrates the three leadership climates.

Note: The autocratic climate included two groups.

3- Experiment Control

The four clubs were homogeneous in terms of personal and physical traits, level of intelligence, inclination to obedience, readiness for cooperation with the group, as well as types of social and personal relations. The meeting rooms were identical in every detail, whether in terms of furniture or content, and the forms of activity in all the clubs were unified. To ensure such homogeneity, intelligence tests, teachers' assessments, and the sociometric scale of social relations were employed.

3-1- The Democratic Group

In the democratic group, the members met together and collectively determined the types of activities, the raw materials, and the tools required to carry out the chosen task. After discussion, they decided to construct models of wooden airplanes.

3-2- The Autocratic Group

In the autocratic group, the program was imposed on the members without allowing them to have a say in its choice.

- *Dans la condition « directive » l'animateur est directif dans sa passation d'ordres et ceux-ci ne peuvent pas être discutés (pas de rétro-action possible). L'animateur occupe donc ici un statut de chef assimilable au paternalisme.*
  ("In the 'directive' condition, the leader is commanding in giving orders, and these orders cannot be discussed or subjected to feedback. The leader thus occupies the status of a chief comparable to paternal authority.")
  (Lewin & White, 1939, p. 290).

3-3- The Laissez-faire Group

In the laissez-faire group, raw materials and tools necessary for the activity were provided, but no specific activity was determined for them. This experiment was conducted by four trained facilitators, well-versed in educational psychology and social psychology. They alternated among the four clubs, taking turns to adopt each of the social climates, and were instructed on the roles they had to assume in each condition. Observation records were kept for

each group, and interviews were conducted with the children, their parents, and their teachers both during and after the experiment (Khwais, 2017, p. 14).

4- Description of the Social Climates

4-1- Democratic Climate

The club's policy and activities were decided upon through group discussion and collective decisions based on majority voting, with the leader's encouragement and active participation. The objectives of the activity were clearly known to all, and the steps were discussed democratically. Each child was free to choose his workmates and the tasks he wished to perform. The leader made use of reward and punishment in an objective and impersonal manner, participating in the group morally rather than materially. When asked for advice, he responded flexibly by offering several possible solutions and leaving the members free to choose among them (Al Abdullah, 2012, p. 49).

- *Le leader démocratique : participe à la vie du groupe, mais ne donne pas d'ordres, fait des suggestions et encourage les autres enfants dans leurs productions.*
  ("The democratic leader participates in the group's life but does not give direct orders; he makes suggestions and encourages the children in their productions.")

- *Dans la condition « participative » l'animateur est participatif avec tous les membres du groupe. L'apprentissage est basé sur l'interaction entre les membres du groupe et l'animateur occupe un poste d'animation dans l'apprentissage.*
  ("In the 'participative' condition, the facilitator engages with all members of the group. Learning is based on interaction among the members, while the facilitator assumes a role of guidance in the learning process.")
  (Lewin & White, 1939, p. 295).

4-2- Autocratic Climate

In this climate, the club's policy and activities were determined solely by the leader. The steps were dictated one by one, without the goals being previously known to the members. The children had no freedom to choose their workmates, as the leader assigned both the task and the partners. Reward and punishment were used in a subjective and personal way. The leader did not share in the group's activity but intervened from time to time to explain and clarify the method of work explicitly (Khwais, 2017, p. 15).

- *Dans la condition « directive » l'animateur est directif dans sa passation d'ordres et ceux-ci ne peuvent pas être discutés (pas de rétro-action possible). L'animateur occupe donc ici un statut de chef assimilable au paternalisme.*
  ("In the 'directive' condition, the facilitator is commanding in issuing orders, and these cannot be discussed. He thus occupies the position of a leader comparable to paternal authority.")
  (Lewin & White, 1939, pp. 297–298).

4-3- Laissez-faire Climate

In this climate, the members enjoyed complete freedom in choosing the type of activity, their behavior, and even whether to work or not, with minimal involvement from the leader. Objectives were set with total freedom, and workmates were chosen without restriction. The leader was entirely neutral in his behavior and made no attempt to evaluate or organize the group's activity. His role was limited to pointing out the available resources and tools and showing readiness to provide advice or assistance if requested. No system of reward or punishment was applied; instead, there was total neutrality.

- *Le leader permissif : apporte ses connaissances techniques, mais ne cherche pas à s'impliquer émotionnellement dans les activités de group.*
  ("The permissive leader contributes his technical knowledge but does not seek emotional involvement in the group's activities.")

- *Dans la condition « laissez-faire » l'animateur est en retrait face aux demandes du groupe. Son rôle est de surveiller les activités sans intervenir dans le groupe.*
  ("In the 'laissez-faire' condition, the facilitator withdraws in response to the group's demands. His role is to supervise activities without intervening in the group.")
  (Lewin & White, 1939, pp. 298–299).

5- Results of the Experiment

5-1- Results regarding mutual trust:

5-1-1- In the democratic club:

A general atmosphere of mutual trust and spontaneous responsiveness prevailed among the members themselves as well as between them and the leader. The children would share their problems and even their secrets with him. Some of them even offered parts of their production as gifts to the leader. Members were also keen to receive appreciation from one another. Thus, the democratic climate was characterized by greater friendliness and less discontent.

5-1-2- In the autocratic club:

Members became more dependent on the leader, constantly seeking to flatter him and draw his attention in order to gain rewards and avoid punishment. There was no genuine atmosphere of mutual trust, neither among the members themselves nor between them and the leader. It became evident that the autocratic climate fosters feelings of resentment and hostility towards the leader.

5-1-3- In the laissez-faire club:

The level of mutual trust was intermediate, falling between the democratic and autocratic climates.

5-2- Results regarding emotional behavior:

5-2-1- Democratic behavior:

In this climate, there were no signs of anxiety. Instead, members experienced feelings of stability, psychological comfort, and peacefulness.

5-2-2- Autocratic behavior:

This climate was dominated by feelings of rejection, frustration, and deprivation, which in turn led to anxiety, instability, irritability, and a decline in group morale (Hanafi, 2002, p. 56).

5-2-3- Laissez-faire behavior:

Here, the level of discontent was moderate, situated between that of democracy and autocracy. It is useful to support this finding with a statement by Gibb, who defined the affective relationship between teacher and learner in the educational setting as being based either on love or on fear:

- If love is strong and fear is strong, the relationship is **"parental."**
- If love is strong but fear is little or absent, the relationship is **"pure."**
- If love is little or absent and fear is strong, the relationship is **"tyrannical."**
  (Gibb, 1954).

5-3- Results regarding the leader's complete withdrawal from the club:

The leaders deliberately absented themselves for short periods from some meetings in all the clubs. The results were as follows:

5-3-1- In the democratic climate:

Production in the absence of the leader was equal to production in his presence. Similarly, the level of activity remained consistent whether he was present or absent.

- *Ils constatent qu'avec un leader démocratique, la production est presque semblable à celle obtenue avec un leadership autoritaire, puisque la quantité est meilleure alors que la qualité est légèrement inférieure.*
  ("They observed that under a democratic leader, production is almost similar to that obtained under authoritarian leadership: the quantity is superior, although the quality is slightly lower.")
  (Lewin & White, 1939, p. 300).

5-3-2- In the autocratic climate:

The group showed itself capable of sustained work only in the presence of the leader. However, whenever the leader was delayed, the work was also delayed, and when he left, the activity stopped altogether; members neither resumed previous tasks nor initiated new ones.

5-3-3- In the laissez-faire climate:

An atmosphere of chaos and lack of cohesion prevailed among the team members.

- *À l'inverse, le leader permissif est un style improductif, car apparaît la démotivation au travail, qui place le sujet dans une forme d'apathie et de retrait. Le leader démocratique a l'avantage de permettre que le leader s'efface au profit du groupe qui doit alors s'autogérer. La frustration des membres diminue.*
  ("Conversely, the permissive leader represents an unproductive style, as it results in a loss of motivation for work, placing individuals in a state of apathy and withdrawal. The democratic leader, however, has the advantage of being able to step back in favor of the group, which then manages itself. This reduces members' frustration.")
  (Lewin & White, 1939, pp. 300–301).

5-4- Results of the Experiment in terms of Social Behavior

5-4-1- In the democratic climate:

There were clear signs of friendliness among the members in their social behavior. The feeling of "we" (collective identity) was stronger than the feeling of individuality. Group morale was higher than in the other two groups.

5-4-2- In the autocratic climate:

In the aggressive group, members displayed hostile behaviors toward one another, with some aggression also directed toward the leader. Their behavior was also characterized by destructiveness, as they destroyed the models they had previously made. On the other hand, in the submissive group, members showed compliance and strong dependence on the leader, accompanied by an inability to engage in cooperative work and frequent low-voiced conversations.

5-4-3- In the laissez-faire climate:

Friendly signals were observed among members toward one another, but at a level lower than in the democratic and autocratic (aggressive) climates, though higher than in the autocratic (submissive) climate.

5-5- Results of the Experiment in terms of the Succession of Social Climates

5-5-1- Transition from autocracy to democracy or to laissez-faire:

This shift initially resulted in an outburst of violent reactions, especially among individuals who had previously been subjected to the autocratic system. Such an outburst indicated the repression and intense tension that members had felt under autocracy. However, this behavior did not last long, as the children eventually adapted to the democratic or laissez-faire climate.

5-5-2- Transition from autocracy to democracy or laissez-faire, then back to autocracy: This sequence was met with strong opposition, particularly after the members had experienced the democratic climate.

6. Summary and Commentary on the Experiment's Results:

This experiment indicates that democratic leadership is the style that should be cultivated and reinforced. The results of the experiment also show that just as an individual rejects a system or authority imposed externally upon them, they likewise do not feel comfortable in the complete absence of any guidance or direction, nor in the absence of a goal to orient themselves toward. An individual's need for freedom is thus balanced by their need for regulation within the framework of a democratic climate (Issawi, 1992, p. 87).

Conclusion:

Effective educational leadership plays a fundamental role in supporting the transformation of the school model. This necessitates that institutes and training centers affiliated with the Ministry of Education or Higher Education pay greater attention to providing effective academic programs for preparing school leaders capable of generating genuine improvement in students' performance. Furthermore, the study of group leadership within the classroom—what is referred to as the "dynamics of the group"—has provided an opportunity for those interested in this field to explore the latest theories, whether they pertain to psychological or sociological approaches that examine both the individual and the group simultaneously.

This experiment also encourages us to consider the psychological and social needs of learners during the actual practice of the pedagogical process. For a classroom group to achieve its objectives—which are centered on acquiring the competencies necessary to face various life situations—it is essential that a type of positive dynamism occurs. This dynamism allows members of the group to develop their skills, modify their behaviors in the desired direction, and acquire the essential values that enable them to confront challenges in their lives, all through practice in educational situations within the classroom (Maher, 2002, p. 52).

Acknowledgments

The author expresses sincere gratitude to the University of Oran 2 – Mohamed Ben Ahmed for providing academic and institutional support during the preparation of this research. Special appreciation is extended to colleagues in the Department of Education for their constructive feedback, and to the students whose engagement in classroom practices continues to inspire the exploration of effective educational leadership.

Conflict of Interest Statement

The author declares no known competing financial interests or personal relationships that could have appeared to influence the work reported in this paper.

Abstract

The accelerating pace of technological innovation and global interconnectedness has profoundly reshaped social life and the processes of family upbringing. Globalisation, reinforced by digital communication technologies, the internet, and satellite media, has introduced new opportunities for learning, cultural exchange, and access to knowledge, while simultaneously creating complex risks that threaten the stability of family dynamics and the psychosocial development of younger generations.

This study examines the dual impact of globalisation on family socialisation, with particular focus on the phenomenon of electronic upbringing—an emerging process in which digital devices and global media environments play a central role in shaping children's values, behaviors, and identities. While globalisation and technological progress facilitate exposure to diverse perspectives and strengthen educational opportunities, they also present profound challenges related to excessive media consumption, inadequate parental monitoring, cultural dissonance, and the erosion of traditional value systems.

The analysis underscores the urgent need for new approaches to family education that integrate traditional

socialization practices with contemporary digital realities. It argues for the establishment of pedagogical strategies and parental guidance models that harness the benefits of globalisation and electronic tools while mitigating their risks. By situating electronic upbringing within the broader sociological and pedagogical discourse, this paper highlights the importance of cultivating resilience, critical digital literacy, and cultural awareness in younger generations. The study ultimately contributes to a more comprehensive understanding of how families can navigate globalisation's opportunities and challenges to ensure balanced psychosocial development and the sustainable transmission of values across generations.

Introduction:

Social globalisation refers to the standardisation of societies worldwide according to prevailing social norms in the Western world, through which the family is undermined and, ultimately, destroyed.[1] This issue places significant weight on Arab societies in general and Islamic societies in particular, with a special emphasis on the family, which constitutes the basic structure for building our communities. It is a subject fraught with challenges arising from Western civilisation. While this civilisation has brought development and prosperity to all fields of life, economic, social, and scientific, it has also left behind adverse effects that have hurt society. People have come to feel that life was simpler and more comfortable in the past, as they lived within a secure and reassuring environment, with a life free from complexity.

The concept of "globalisation," which surged during the late last century, represents the formation of a new global system that now serves as the framework influencing all societal aspects at the local, international, and regional levels. Globalisation has become the dominant force shaping the political, economic, and cultural achievements of the international community, employing mechanisms to serve its objectives, whether negative or positive.[2]

The phenomenon of globalisation, along with its institutions and technologies, has crystallised over the past two decades through a range of policies intended to achieve its strategic goal: the reshaping of the economic systems of all states and transforming them into market economies to integrate them into the globalised framework of societies. To realise this material goal, globalisation has employed mechanisms with political, social, cultural, and military dimensions that have impacted Arab peoples and societies and their families through the adoption of globalisation policies and programs by their governments. These have been converted into national public policies whose implementation affects the lives of citizens and families primarily, both negatively and positively.[3]

Hans Peter Martin and Harald Schumann, authors of *the Global Trap*, noted that globalisation through modern liberal policies, which rely on unleashing market mechanisms, reducing social services provided by the state, shrinking state intervention in daily life, and limiting the state's role in managing the system, has led to rising unemployment, declining

wages, and worsening living standards. These factors now shape the contours of the globalised social system and the associated social life.[4]

Problem Statement:

Many sociologists consider childhood experiences a fundamental determinant of human behavior. Children quickly receive information and react to it rapidly. The amount of knowledge a child absorbs by the time they reach a certain age surpasses the knowledge they will gain throughout the rest of their life. These experiences have both positive and negative effects. Supporters of modern media and its impact on the child's personality argue that media fosters the social aspects of the child by enabling interaction with others and exchanging conversations. The media also refines the child's emotions and feelings, trains their senses from an early age in listening, following, connecting, and analysing, broadens the child's freedom as a source of knowledge, imparting cognitive and behavioural values, transmitting culture and knowledge, and developing the child's intellectual and mental faculties.

However, there is no doubt that the transformations witnessed in our world today, accompanied by significant technological developments, have affected all aspects of life, particularly the profound changes experienced in social life within the family and their adverse effects on social upbringing processes. Despite the positive aspects achieved and benefits gained by individuals, which cannot be denied due to their importance in daily life, adverse effects have begun to emerge, signalling serious risks and problems that society must recognise and address. One of the most significant changes faced today stems from the concept of globalisation, which has introduced ideas and considerations that connect this concept to daily life, presenting it as a cultural revolution indispensable to people and societies, especially in the context of challenges confronting society and the family. This is evident in the modern technologies promoted by globalisation, such as mobile phones, the internet, and satellite channels, and the hybrid ideas they propagate, which cannot be fully comprehended by traditional minds, particularly in societies with established customs, traditions, and norms. This situation burdens the family with considerable challenges in controlling the upbringing of their children and protecting them through sound socialisation from all imported customs, values, and ideas that have no relevance or connection to reality or thoughts.

Problematic issue:

The problem or risk perceived by Arab societies lies not in the concept of globalisation itself but rather in how it is implemented and the clarification of its dangers. Regional and international conferences and seminars have been convened to identify the sources of this challenge and its most prominent manifestations.[5] It is widely recognised that many who have examined globalisation have focused on economic globalisation. In the economic and financial context, globalisation is understood by Western scholars as the creation of a single, open global market, essentially a return to the ideas of Keynes. While this notion may appear positive in a general sense, its underlying intention is to prioritise the interests of Western countries, facilitating unrestricted circulation of currencies and financial securities in their markets.[6]

However, less attention has been given to its social effects on the family and the risks it poses to the social values, ethics, and socialisation processes of children, resulting in negative consequences for our youth and families and obstructing familial communication and cohesion. Additionally, it impacts cultural identity by breaching community culture and threatening customs, traditions, and constants that preserve and protect societal privacy.

Research Questions:

- What are the social risks of the uncontrolled consumption of globalisation within the Algerian family?
- How can the concept of electronic upbringing be integrated into the family's role in the socialisation of children?
- To what extent is the child's culture affected in light of the original cultural constants of the Algerian family?

Research Objectives:

1. To identify the social risks caused by globalisation to the structure of the Algerian family.
2. To reach recommendations that help enlighten minds through promoting positive programmes and limiting the spread of negative values propagated by globalisation, thereby preserving the structure and cohesion of society.

Subjects: Economic Sociology

Supervisor: Al-Khawaja, Mohammed Yasser Shibl

This study addresses the requirements of social upbringing within the context of the economic dimensions of globalisation as a sociological study of the family. The research began with an introduction outlining the importance of the topic, the rationale for its study, its objectives, and a review of previous research. The study examined the problem statement and the theoretical framework by presenting the problem and its significance, aims, and research questions, along with the conceptual framework and definitions of the key terms used. It then reviewed prior studies before

exploring the origins and mechanisms of globalisation, including its historical emergence, institutions, mechanisms, and fundamental aspects.

The study proceeded to address the economic dimensions of globalisation and their societal implications by analysing these economic dimensions and their global societal impacts. Furthermore, this research investigated the effects of economic globalisation on family structure, focusing specifically on the Egyptian family. It examined the impacts of economic globalisation on the Egyptian family, its socialisation processes within the family context, and the conditions required for effective family upbringing amid economic globalisation.

The methodological strategy of the study was then presented, including the research model, methodology, unit of study, geographical and temporal scope, and statistical methods applied in the analysis. The field study followed, describing the research community, analysing the field data results, and comparing the findings with those from other studies and research. The study concludes with a summary of the main results obtained throughout the research process.

Concept Definitions

1. **Globalisation (Globalisation):** Linguistically, it simply means making something globally widespread in its reach or application. It is also the process through which institutions, whether commercial or otherwise, expand their global influence or begin operating on a global scale.[7] Globalisation is a term recently introduced into the Arabic lexicon as a translation of the English term "Globalisation" and the French term "Globalisation," both derived from a common Latin root "Glob," meaning the globe or earth.[8] In other words, it signifies "cluster" or "universality". "[9] Globalisation is the new phase emerging from the simultaneous development of information, technological, and economic revolutions, representing a stage of civilisational progress in which humanity's destiny becomes unified or tends toward unification.[10]

2. **The Family (The Family):** In Arabic, the word family implies holding, strength, and nature, as indicated in the Quranic verse: "We created them and strengthened their bonds." (Surat Al-Insan).[11] The family is defined as the primary fundamental social group and is regarded as the social institution exerting a strong influence in educating offspring, imparting a set of values, customs, traditions, and norms through the process of socialisation, which begins primarily within the family.[12]

3. **Socialisation (Socialisation):** This concept is defined as preparing the individual from birth to be a social being and a member of a particular society. The family is the first environment responsible for this preparation, as it receives the newborn, surrounds and nurtures them, teaches social conduct, and imparts the language, cultural heritage, customs, traditions, social norms, and national history. The family applies discipline to eliminate resistance to these attributes and values, instilling their sanctity in the child's self, enabling them to grow into a virtuous member of society. No other environment equals the family in this regard.

4. **Social Change:** The literal meaning of "change" refers to transformation, alteration, or transition from one state to another. When combined with "social," the term indicates transformations related to society, its elements,

systems, processes, or the relationships between its components.[13] Social change is defined as any transformation that occurs within a social organisation, whether in its structure or functions, over a specific period. It encompasses changes in the population composition, social stratification, social systems, patterns of social relations, and values and norms influencing individual behaviour and determining their roles and positions within various social structures to which they belong.[14]

I. Globalisation and Family Structure:

The family faces significant challenges, especially in the twenty-first century. The rapid developments engendered by information technology, modern devices, and technologies that flood global markets have made it difficult for parents to raise their children to shield them from the temptations presented and heard in today's world. This demands strengthening religious conscience in children, distinguishing right from wrong, and utilising technology beneficially. Arab society, particularly Islamic society, serves as a model for other religions as the seal of the revealed religions, which has elevated the Islamic world to great heights. Islam accepts advancement in various life domains; in contrast, it encourages knowledge, learning, and invention, harnessing human capacities that have yielded many accomplishments and propelled Islamic civilisation to its pinnacle.

Furthermore, Islam calls on society to embrace inclusivity beyond its immediate environment and reject isolation and seclusion, as illustrated in the Quranic verse: "And We made you into nations and tribes so that you may know one another. Indeed, the most honoured of you in the sight of Allah is the most righteous of you. "[15]

- One of the most important functions the family performs for society is socialisation, which equips society with individuals attuned to its nature; committed to its principles, values, and goals; speaking its language; and adhering to its religion and ideology. The family educates the new generation in the society's language and religious and ideological principles, continually reminding them of their history and glorious heritage, and instilling the social and moral qualities that society embodies.[16]

- One of globalisation's primary objectives is to dismantle and fragment the social fabric, especially in Arab and specifically Islamic societies, by undermining the religious foundations that constitute essential pillars of social cohesion and individual life. This is achieved through the introduction of new norms inspired by Western perspectives and the imposition of a new ideology proliferated by the technologies of information and modern techniques, which have had a clearly discernible effect on the members of a single family.

Attempts to influence the family have centred on several axes, the most important of which are as follows:

1. The pattern of social relationships and family communication between spouses has changed, with the emergence of new relationships bearing globalised labels such as homosexuality and marriage without formal contracts, making these concepts socially acceptable. Additionally, women face the challenges and ideologies of globalisation aimed at erasing their moral, cultural, and historical privacy, replacing it with pornography and hedonism through the replication of Western perspectives marked by moral and ethical decay.

[15] Dr. Saleh Al-Quraishi, Previous Reference, p. 100.

[16] Davis, K., Human Society, New York, The Macmillan Press, 1967, p. 599.

2. The pattern of family culture has shifted, especially concerning the relationship between children and parents and the weakening of family communication due to media influx and the information revolution. The proliferation of satellite channel broadcasting programmes and films detached from the realities of our lives has contributed to this change. Furthermore, the internet and mobile phones have become inseparable components of daily life and luxuries that many now consider indispensable. Childhood is also targeted through various channels through which globalisation pursues its objectives, albeit covertly, under the guise of safeguarding children's rights.

II. Social Relationships and the Family

1. Social Relationships within the Family:

This refers to the relationships established between the roles of husband, wife, and children, as well as the nature of the communication that occurs among family members residing in the same household. This includes the relationship between the husband and wife and among the children themselves.[17] Significant transformations have occurred, profoundly impacting family structure, especially within urban Arab contexts. Families have shifted from extended and patriarchal forms to nuclear families characterised by economic considerations, freedom, and independence. Urbanisation, technological advancements, and the influence of globalisation on the Arab world have diversified familial social relationships. Globalisation has had a pronounced social impact, notably causing an increase in the variety of social relationships, especially between spouses. Whereas the relationship between husbands and wives was traditionally exclusive and based on the equitable relationship prescribed by God and the Qur'an, globalisation has introduced concepts that threaten cultural identity. Among these is so-called homosexuality, which is prohibited in Islam, along with the recognition of marriage without a formal contract. Numerous organisations now demand the recognition of homosexuality and noncontractual unions. The following sections address these relationships sequentially, explaining the significance of each and its impact on family structure in terms of moral and societal degradation.

- **Social relationships between the husband and wife**

In the past, the father headed the household, made decisions related to the home, and endeavoured to provide the family's necessities. The relationship of the wife with her husband was characterised by obedience and submission, whereas her role included child-rearing and care. However, industrialisation and urbanisation disrupted this traditional model, leading to changes such as the following:

1. Husbands assisting their wives with domestic tasks;

2. Women assuming responsibility during the husband's absence;

3. Conflicts between husband and wife.[18]

Through globalisation, families have been standardised to social patterns prevalent in Western families, which has led to the destruction and dissolution of the family by promoting defective values, such as the following:

[17] Ghaith Mohammed Atef, Dictionary of Sociology, Dar Al-Ma'arifa Al-Jami'iya, Alexandria, 1992, p. 437.

[18] Abdullah Ibn Ahmed Al-Alaf, Improving Communication Patterns in Family Relationships, Master's Thesis in Family Therapy, internet, alaf@homall.com.

- Freedom over the body, including sexual relations between males and females (heterosexuality), and the consequences of illegitimate pregnancies, along with laws permitting abortion, which is legal in most Western countries.[19]

- Deviants (Homosexuality): It is necessary to understand the concept of homosexuality, known in English as homosexuality. Homosexual orientation is defined as a strong, continuous psychological, emotional, and sensory attraction towards a person of the same sex. This orientation may culminate in a desire for physical union and subsequent sexual contact. Such orientations differ qualitatively from the conventional sexual relations associated with biological sex, social sex, and social roles.[20]

Homosexual orientation differs from other types of sexual behaviour in that it results from often ambiguous feelings intertwined with the individual's self-perception and their degree of acceptance of their orientation. A person is not necessarily homosexual simply because they engage in homosexual acts; it is important to distinguish between homosexual orientation and homosexual behaviour. Homosexual orientation refers to an individual's psychological, emotional, and sexual attraction to persons of the same sex. Many people naturally possess such orientations and feelings. Some studies indicate that approximately 4% of the world's population has homosexual orientations. Notably, many individuals with such orientations do not engage in homosexual sexual practices, whereas many who engage in such practices do not necessarily have a homosexual orientation.

Homosexuality is a form of sexual deviance that has existed since ancient times, but its origins are unknown. Multiple factors contribute to the prevalence of this phenomenon, the most important of which are economic, social, and psychological factors. Its occurrence is greater in poorer regions than in wealthier regions, mainly because many young men and women in impoverished areas are unable to marry early due to exorbitant costs, family demands concerning dowries, and the high expenses necessary for establishing a complete marriage. The social aspect broadly relates to strict gender segregation, which prevents youth from releasing much of their energy through innocent means. Homosexuality is more prevalent among males than females in our societies because of its masculine nature.

There are several methods to reduce this phenomenon, including permitting innocent coeducation between the sexes and providing sports, social, and cultural clubs that help young men and women channel their energy into beneficial activities.[21]

III. The Social Dimension of Globalisation and Family Cultural Patterns

A. Relationships between parents and children:

It is well known that the relationship between parents and children is eternal, as ancient as life itself, and is influenced by the environment in which individuals are raised. Consequently, prevailing values and individual and collective behaviours in this crucial relationship change according to evolving circumstances. Despite this, a famous Arab saying worthy of reflection remains: "Raise your children according to morals different from yours, for they are created for a time different from yours," attributed to Imam Ali (peace be upon him).

In their upbringing of children, parents rely on religious, devotional, and ethical means and methods derived from Islamic culture, which they seek to embody in family life. Among the most influential methods for shaping children's personalities is the method of imitating role models, which is considered one of the most important, most successful,

[19] Kamelia Hilmi, Previous Reference, internet.

[20] Homosexuality, Wikipedia, The Free Encyclopedia, internet, http://ar-wikipedia.org/wik/index.php.
[21] Wasfi Al-Samaraa'i, Homosexuality: Causes and Treatments, Al-Hiwar Al-Mutamadin, Issue 2637, 2009, internet.

and most effective in forming a child morally, psychologically, and socially. This is because the educator, whether parents or others, represents the ideal in the eyes of the child, who instinctively tends to imitate and emulate.[22]

Parents and children must understand their relationship, remember the bond of blood and kinship, the importance of awareness of rights and duties, and act with high moral and noble human sentiment to preserve, purify, develop, and elevate this relationship beyond degradation and disobedience. This is a fundamental matter that must be observed in our authentic Islamic societies. The problem arises from the stark contradiction between how the relationship between parents and children should be and the reality of this relationship. Reports of disobedience from children daily hurt us, and we suffer upon hearing of the harshness of some parents in raising their children.[23]

Notably, there have been clear developments in the relationship between children and parents due to the radical changes in Arab society, especially the discovery of oil, which has led to economic and social changes reflected in social life, including changes in family conditions. This has caused many problems that distress the family and affect its children.

1. **The Problem of Raising Children in the Context of Globalisation:**

   In the modern era, the functions of upbringing have changed due to the increasing flow of information, the clash of knowledge, the openness of human societies to one another, and changes in values and lifestyles. All of these factors have complicated the responsibility of upbringing, making it heavy and complex, particularly in terms of transmitting heritage from one generation to the next through various educational media in society. Among the functions of social upbringing are the processes of omission, renewal, and addition through their role in preparing individuals for life and work within the framework of globalisation and interaction with diverse social cultures. This requires flexibility, creativity, and innovation rather than rigidity, with children and youth becoming victims of cultural friction and social mobility. Some families inadvertently adopt inappropriate practices in guiding and raising their children to face new life circumstances, mistakenly believing these methods will aid the physical, psychological, and emotional growth of their children within modern society. These methods include overindulgence and excessive protection; neglect and lack of supervision and follow-up; lavish luxury; fascination with all that is new publicly; materialistic and superficial competition; absence of good role models; discrimination in treatment; harshness; and lack of safety and reassurance.[24]

Additionally, there is reluctance among youth to marry due to the prevalence of sexual immorality (pornography) and due to marriage and divorce laws that make marriage a trap for young people. All of these factors pose challenges to Arab cultural identity by spreading many material and moral phenomena unrelated to Arab culture and identity among much of the Arab populace.[25]

2. **Media Influx and the Information Revolution:**

[22] Ruqayya Khayyari, Islamic Culture and Family Upbringing: A Field Study in Biskra, Master's Thesis, Mohamed Khider University of Biskra, Published Online, http://ww.elganna.com.

[23] Abdullah Ibn Ahmed Al-Alaf, Improving Communication Patterns in Family Relationships, Master's Thesis in Family Therapy, internet, alaf@homall.com.

[24] Aziza Al-Tai, The Culture of the Child Between Identity and Globalisation, National Programme for Book Support/Oman Authority/Cultural Club in Muscat, 2011, p. 97.

[25] Mohammed Sael Nasrallah Al-Ziyoud, The Impact of Globalisation on Arab Culture, Faculty of Educational Sciences, University of Jordan, Amman, Jordan, internet.

The media holds great importance in daily life, as it plays a critical role in building a civilised society on the basis solely of scientific foundations. The media is connected to, and influenced by, the social systems to which it belongs. Its supreme importance is highlighted in its impact on the level of knowledge and social development and even on the continuity and sustainability of society. The media is not a temporary phenomenon but rather a generator that transmits opinions and beliefs from one generation to another and fosters relationships between them. Undoubtedly, the media can affect human awareness and behaviour at all life stages, shaping their viewpoints, convictions, and understanding of life. Here, the focus is on media content directed at children. This content has become one of the most dangerous media industries today, potentially constituting a full-blown war alongside Crusades and Zionist wars and their protocols.

This war employs the globalisation of sound and image through the spread of satellite dishes, multiple television channels, and the emergence of the internet. This rapid dissemination has brought new and more sophisticated methods to capture children, control their minds, and lead them to addiction. Most companies operating in this field are foreign firms that aim to instill Western culture and the concepts of entertainment, play, and leisure. These are deeply rooted in Western secular ethics, treating children's media as a market-driven enterprise focused on profit rather than values, thereby generating psychological and moral distortion in children. This distortion complicates correction, as these models and patterns become ingrained in the unconscious with age.[26]

IV. Field Study

Methodological Framework:

The study employed the social survey method via a sample approach, which typically involves examining a specific number of cases or units within the constraints of time, effort, and resources available to the researcher. The social survey method was followed in the following steps:

1. **Defining the Problem:**

   The research problem was defined by identifying the social dimension of globalisation and its effects on electronic upbringing within the family.

2. **Statistical Sample:**

   A sample is understood as a specific portion, both in quantity and type, representing several individuals presumed to possess the same characteristics present in the study population. The statistical sample in this research consisted of 25 units (families), which were randomly selected from the city of El Sharaf in Djelfa Province as follows: a random sample of 25 family units was drawn from the residential neighbourhood where the researchers reside (Al-Mala's neighbourhood in El Sharaf).

Accordingly, data collection relied on the following tools:

1. **Questionnaire:**

   A questionnaire is a tool comprising a set of questions or statements requiring respondents to answer according to a method specified by the researcher, depending on the research objectives.[27]

[26] Ahmed Abdul Karim Al-Rubaie, Muslim Child between Civilisational Heritage and the Danger of Contemporary Globalisation, Mosul, Iraq, Published Research on the internet, http://www.gulfkids/ar/index.php/action=show.

[27] Ahmed Salman Ouda, Fathi Hassan Malouki, Fundamentals of Scientific Research in Education and Human Sciences, Al-Manar Publishing and Distribution Library, Zarqa, Jordan, 1987, p. 150.

2. **Validity Testing of the Questionnaire:**

Validity refers to the questionnaire's ability to measure what it is intended to measure. Content validity was assessed by determining the relevance of the questionnaire items to the variable under study.[28] This was accomplished by presenting the questionnaire to a panel of experts to obtain their opinions. Following their evaluation, the agreement rate for the questionnaire items reached 91.07%, which was considered evidence of the questionnaire's face validity before field implementation. The panel consisted of four experts specialising in the subject matter.

3. **Interview:**

An interview is defined as a structured, personal interaction involving direct verbal communication between the interviewer and one or more respondents regarding a specific topic.[29] This implies that a social process takes place between two individuals: the researcher and the respondent. It involves a reciprocal exchange, where the researcher poses questions to the respondents following an explanation of these questions to elicit answers.

3. **Statistical Data Table:**

The process of tabulating the statistical data was conducted in systematic steps as follows:

A. Verification of the questionnaires:

This step involves examining all completed questionnaires to ensure that they have been fully answered.

B. Coding the Responses

This step requires converting the data obtained from the questionnaires into numerical codes. This transformation enables the classification and description of the data in statistical tables. The percentages are subsequently calculated via the percentage formula as follows:

$$\text{Percentage}=\text{Population}/\text{Sample}\times 100$$

C. Formation of Statistical Tables (Tabulation of Data):

This follows the coding process, whereby the data are organised into statistical tables for analysis.

Statistical methods used in the study:

After the respondents' answers were transferred into statistical tables, the researcher analysed the data via the statistical software SPSS. The following measures were employed:

1. **Percentage of frequency:**

[28] Black, James et al., Methods and Issues in Social Research, John Wiley and Sons, New York, 1976, p. 222.

[29] Omar Mohammed Al-Toumi, Scientific Research Methodologies, Dar Al-Thaqafa, Beirut, 1971, p. 299.

2. This measure was used to determine the extent to which the sample members agreed with the questionnaire items.

3. **Arithmetic Mean:**

4. This method is used to identify the degree of dispersion of the sample members' responses from the assumed mean.

5. **Standard Deviation:**

6. Helps ascertain the consistency of the sample members' responses.

Second: Presentation, Analysis of Data, and Results of the Study Population

Questionnaire Items

01- Personal Data

- Gender: Male/Female
- Age: 20–30/31–40/41–50/51–60
- Educational Level: No Education/Primary/Secondary/Higher Diabetes
- Number of Children: _____

02- Study Questions

Response Options:

Yes/Sometimes/To some extent

- Do you feel that your young children spend most of their time watching cartoons and animated shows?
- Do you, as parents, feel that your children are influenced by scenes in films that may provoke violence and rough behaviour in them?
- Does watching television programmes affect your children's academic achievement and lead to their failure?
- Does excessive use of mobile phones reduce their opportunities for social interaction within their family and social environment?
- Does the inappropriate use of mobile phones affect monthly family income?
- Does excessive use of the internet by children lead them to lose shame when speaking about obscene acts involving the opposite sex?
- Does excessive internet use prevent children from attending family social situations?

- Does excessive internet use contribute to the decline in children's moral values?
- Are your children's academic failure and tardiness at school caused by excessive internet use and prolonged sitting before it?

Descriptive Tables of Personal Data of the Sample

Table 1

Distribution of sample members by gender

Gender	Number	Percentage
Male	25	50%
Female	25	50%
Total	50	100%

Table 1 shows that males represent 50% of the sample members, whereas females represent 50% of the sample.

Table 2

Distribution of Sample Members by Gender within Each Age Group

Age	Male Frequency	Male %	Female Frequency	Female %	Total Frequency	Total %
20–30	6	24%	5	20%	11	22%
31–40	6	24%	7	28%	13	26%
41–50	8	32%	11	44%	19	38%
51–60	5	20%	2	8%	7	14%
Total	25	100%	25	100%	50	100%

From Table 2, it is evident that the highest percentage of male respondents (32%) falls within the 41–50 age group, followed by equal percentages of 24% for both the 20–30 and 31–40 age groups. The lowest percentage of males (20%) was in the 51–60 year age group. The arithmetic mean age for male respondents is 40.4 years, with a standard deviation of 9.97.

For females, the most significant proportion (44%) was in the 41–50 age group, followed by 28% in the 31–40 age group, 20% in the 20–30 age group, and 8% in the 51–60 age group. The mean age for both male and female respondents combined is 40.79 years, with a standard deviation of 9.122.

Table 3

Educational Level of the Husband

Educational Level	Male Frequency	Male %	Female Frequency	Female %	Total Frequency	Total %
Primary	0	0%	0	0%	0	0%
Secondary	8	32%	13	51%	21	42%
Higher Diploma	17	68%	12	49%	29	58%
Total	25	100%	25	100%	50	100%

According to the data in Table 3, 32% of the males had a secondary educational level, whereas 51% of the females had the same level. Moreover, 68% of the males held a higher diploma than 49% of the females did.

Table 4

Number of Children

Number of Children	Male Frequency	Male %	Female Frequency	Female %	Total Frequency	Total %
1–2	15	60%	13	52%	28	56%
3–4	6	24%	10	40%	16	32%
5–6	4	16%	2	8%	6	12%
Total	25	100%	25	100%	50	100%

Table 4 shows that 60% of males have one or two children, whereas 52% of females have the same number of children. For those with three or four children, males constitute 24%, whereas females constitute 40%. Among families with five or six children, males represented 16%, and females represented 8%. Overall, 56% of the sample (both males and females) had one or two children, 32% had three or four children, and 12% had five or six children.

Descriptive Tables of the Respondents' Answers from the Sample Families

Table 5

Do you feel that your young children spend most of their time watching cartoons and animated shows?

Response	Male Frequency	Male %	Female Frequency	Female %	Total Frequency	Total %
Yes	14	68%	17	56%	31	62%
Sometimes	10	28%	10	40%	20	34%
No	1	4%	1	4%	2	4%
Total	25	100%	25	100%	50	100%

Table 5 shows that 62% of the respondents affirmed that their young children spend most of their time watching cartoons, with the percentage of females answering "yes" higher than that of males. This may be due to the prevalence of numerous satellite channels showing various cartoon films. At times, parents leave young children in front of television for extended hours to attend to their chores, especially when the mother is employed and aims to complete household tasks quickly.

Table 6

Do you, as parents, feel that your children are influenced by scenes in action movies that may incite violence and aggressiveness?

Response	Male Frequency	Male %	Female Frequency	Female %	Total Frequency	Total %
Yes	13	52%	17	68%	30	60%
Sometimes	10	40%	5	20%	15	30%
No	2	8%	3	12%	5	10%
Total	25	100%	25	100%	50	100%

As shown in Table 6, 60% of the respondents indicated “yes” that their children are influenced by scenes in action movies that may provoke violence and harsh behaviour. The percentage of females who answered “yes” was greater than that of males. Many children, especially those who watch violent cartoons, tend to imitate aggressive and violent behaviours, sometimes even towards younger siblings or their mothers.

Table 7

Does Watching Television Programmes Affect Your Children’s Academic Achievement and Lead to Their Failure?

Response	Male Frequency	Male %	Female Frequency	Female %	Total Frequency	Total %
Yes	16	64%	17	68%	33	66%
Sometimes	4	16%	5	20%	9	18%
No	5	20%	3	12%	8	16%
Total	25	100%	25	100%	50	100%

Table 7 shows that 66% of the respondents affirmed that their children’s watching of television programmes negatively affects their academic performance, leading to failure. The percentage of females who agreed with "yes" was slightly greater than that of males. It is understood that children’s preoccupation with satellite programmes, entertainment, films, and series distracts them from studies and results in academic failure.

Table 8

Does Frequent Mobile Phone Use Reduce the Opportunities for Social Interaction within the Family Environment?

Response	Male Frequency	Male %	Female Frequency	Female %	Total Frequency	Total %
Yes	15	60%	15	60%	30	60%
Sometimes	6	24%	7	28%	13	26%
No	4	16%	3	12%	7	14%
Total	25	100%	25	100%	50	100%

According to Table 8, 60% of the sample respondents indicated that excessive mobile phone use by their children reduces their opportunities for social interaction within the family environment. Both males and females responded "yes" equally to this. Parents reported that their children are frequently preoccupied with mobile phones, downloading new apps, songs, and messages, and using the internet on their phones. This is a negative indicator of their lack of engagement with their family social environment, as parents often complain about their children's absence at family gatherings and lack familial communication.

Table 9

Does Improper Use of Mobile Phones Affect Monthly Income?

Response	Male Frequency	Male %	Female Frequency	Female %	Total Frequency	Total %
Yes	15	60%	13	52%	28	56%
Sometimes	7	28%	12	48%	19	38%
No	3	12%	0	0%	3	6%
Total	25	100%	25	100%	50	100%

Table 9 indicates that 56% of the respondents affirmed that improper use of mobile phones affects the family's monthly income. The percentage of males that answered "yes" was greater than that of females. This is attributed to the large number of prepaid cards consumed monthly by children, which can strain the family budget, especially in families with many children.

Table 10

Does Excessive Use of the internet by Children Lack Shyness when Discussing Obscene Acts with the Opposite Sex?

Response	Male Frequency	Male %	Female Frequency	Female %	Total Frequency	Total %
Yes	13	52%	9	36%	22	44%
Sometimes	4	16%	10	40%	14	28%
No	8	32%	6	24%	14	28%

Total	25	100%	25	100%	50	100%

From Table 10, 44% of the respondents confirmed that excessive internet use by their children leads to a lack of shyness when discussing obscene acts with the opposite sex. The percentage of males that responded "yes" was greater than that of females. This may be attributed to children spending extended periods on the internet and being exposed to images and songs stimulating desires, which sometimes cause them to lose shyness in interactions with the opposite sex. Parents currently face this challenge, as internet use has become necessary and important for managing work, especially if the father owns a company or property. Therefore, parents need to monitor their children's online activities and the websites they visit to protect them from exposure to ideas and morals that are inconsistent with the realities and values of their society.

Table 11

Does Excessive internet Use by Children Prevent Them from Attending Family Social Events (e.g., Holidays, Visiting the Sick, Attending Funerals)?

Response	Male Frequency	Male %	Female Frequency	Female %	Total Frequency	Total %
Yes	13	52%	12	48%	25	50%
Sometimes	6	24%	8	32%	14	28%
No	6	24%	5	20%	11	22%
Total	25	100%	25	100%	50	100%

Table 11 shows that 50% of the respondents confirmed that excessive internet use prevents their children from attending family social events. The percentage of males that answered "yes" was slightly greater than that of females. Children often remain engaged in prolonged internet use, which limits their participation in family gatherings. Parents themselves typically organise these events, and failing to encourage attendance is a significant error, as family communication is vital for maintaining and strengthening social family relationships.

Table 12

Does Excessive internet Use by Children Lead to a Decline in Their Moral Values?

Response	Male Frequency	Male %	Female Frequency	Female %	Total Frequency	Total %
Yes	13	52%	11	44%	24	48%
Sometimes	3	12%	7	28%	10	20%
No	9	36%	7	28%	16	32%
Total	25	100%	25	100%	50	100%

Table 12 indicates that 48% of the respondents believe that excessive internet use leads to the deterioration of their children's moral values, rendering them materialistic. The percentage of males that answered "yes" was greater than that of females. This reflects parents' concerns regarding the decline in their children's moral standards, as children increasingly prioritise financial gains even at the expense of values and ethics.

Table 13

Does Excessive internet Use and Prolonged Screen Time Lead to Academic Failure and Tardiness?

Response	Male Frequency	Male %	Female Frequency	Female %	Total Frequency	Total %
Yes	19	76%	14	56%	33	66%
Sometimes	3	12%	8	32%	11	22%
No	3	12%	3	12%	6	12%
Total	25	100%	25	100%	50	100%

According to Table 13, 66% of the respondents reported that excessive internet use and prolonged screen time cause their children to fail academically and arrive late in school. The percentage of males that answered "yes" was greater than that of females. Parents report their struggle with children arriving late in school or failing exams despite having a conducive study environment at home and tutoring in several subjects. They attributed much of the problem to excessive internet use, including platforms such as Facebook, chat rooms, and YouTube.

Answers to the Questions

- What are the social risks of the uncontrolled consumption of globalisation within the Algerian family?
- How can the concept of electronic upbringing be adopted within the family's role in the socialisation of the child?
- To what extent is the child's culture affected in light of the original cultural constants of the Algerian family?

The field study results indicate that 13 (52%) males and 12 (48%) females answered "yes" to the question of whether their children are constantly engaged with the internet for long hours, preventing them from attending family social events. Notably, parents themselves often host these gatherings; neglecting this responsibility is a significant fault because family communication is vital for maintaining and strengthening social family relationships. Overall, 50% of the total sample affirmed this, whereas 22% from both genders responded "No."

The findings reflect the cultural and educational impact on children due to the weakening of social upbringing, which stems from the following:

- The family abandoned its educational and awareness role.
- Uncontrolled and unregulated consumption of globalisation tools.
- Marketing of globalisation media and making it accessible to all members of society.

- Social problems erode family and community cohesion.

Among the key challenges of globalisation is the capacity to reform and preserve the family unit. The family is the most minor social component in society and plays a vital role in maintaining national identity. It is the fundamental building block of society, influencing its course and shaping its identity significantly. In the Arab world, beyond the family's importance and role, it possesses significant capacities to confront globalisation challenges. By preserving family cohesion and stability and strengthening ties among family members and with other families through kinship, marriage, and neighbourhood bonds aligned with Islamic teachings on spousal ties, affection, kinship maintenance, good neighbourliness, and others, this collectively reflects family cohesion and safeguards the national identity of Arab citizens, especially as Arab families still maintain their distinctive features.

The role of the state in social development involves prioritising education, health, and nutrition and providing basic individual needs, which are essential social considerations in any society.

Social instability in traditional relationships leads to social disorder. Weakening the family's role in social upbringing, along with the distraction of its members by foreign satellite channels, reduces attention to reality and causes escape from it instead of confronting it.

Recommendations and Proposals

Awareness programs should be broadcast through visual media to educate members of society, especially families, about the dangers of globalisation, which has infiltrated society with its enticing slogans but is essentially a plague attempting to influence human thought, particularly in the Third World, through a survival-of-the-fittest policy. Therefore, social guidance programs that increase societal awareness of how to beneficially utilise modern technological tools (such as the internet, mobile phones, and satellite broadcasts) are recommended. These programmes should focus on maximising the positive aspects that benefit our society while avoiding all harmful effects on children's values and morals.

Acknowledgments

The authors extend their gratitude to Blida University and Laghouat University for their institutional support and academic guidance in developing this study. Appreciation is also due to colleagues and students whose discussions and contributions provided valuable insights into the intersections of globalisation, education, and family dynamics.

Conflict of Interest Statement

The authors declare no competing financial interests or personal relationships that could have influenced the research, analysis, or conclusions presented in this paper.

Keywords Self-Employed Entrepreneur; Algerian Legislation; Informal Economy; Youth Employment; Economic Development

Abstract
This study examines the self-employed entrepreneur law in Algeria as a modern legal mechanism designed to formalise informal economic activities, particularly within the digital sector, and to empower youth to participate in the labour market. It explores the legal definition and distinctive features of the self-employed entrepreneur, the procedural requirements for acquiring this status, and the associated rights and obligations. The study also analyses the incentives provided by the law to encourage entrepreneurship alongside the significant challenges faced by self-employed individuals, especially in financing, management, and human development. Finally, the manuscript offers practical recommendations aimed at enhancing the regulatory framework and support systems to promote the sustainable growth of self-employment as a vital component of Algeria's economic development.

Introduction

Unemployment is regarded as a spectre that successive governments in Algeria have sought to alleviate by reducing its impact and searching for solutions through the implementation of a set of measures aimed at training and integrating young people into the labour market, as well as fostering self-initiative within enterprises to support the principle of competitiveness among them. The challenges associated with this phenomenon have been further compounded by the presence of economic activities operating in the informal sector, conducted outside official frameworks that the state has attempted to regulate and codify to incorporate them into the structured economy.

Algeria has encouraged young people to engage in these activities by granting them a set of financial, fiscal, and social advantages, along with other incentives, through the promulgation of the Basic Law on the Self-Employed Entrepreneur (Law No. 23--22 of 18 December 2022), which seeks to strengthen the entrepreneurial spirit among youth and integrate them into the formal economy.[1]

Given the importance of this topic, owing to the novelty of the law and its provisions, it represents a new model in the field of entrepreneurship, framed within the concepts of self-employment and encouraging youth participation. The legal issue raised by this study revolves around the definition of the self-employed entrepreneur and the principal challenges he or she faces in carrying out economic activities.

The study adopts a descriptive-analytical method, examining the relevant dimensions and clarifying specific gaps surrounding the subject. The research is structured into two sections: the first addresses the concept of the self-employed entrepreneur, providing its definition and identifying the associated obligations; the second addresses the advantages granted to the self-employed entrepreneur, as well as the main challenges and constraints encountered in the pursuit of these activities.

At present, all states, including Algeria, are competing to mobilise diverse human capacities and social groups to contribute to advancing economic growth through training, development, and the integration of individuals into entrepreneurship to generate additional wealth to help revitalise the economy. Efforts have therefore been directed towards encouraging microenterprises, start-ups, and small, creative, and innovative businesses, within which the category of the self-employed entrepreneur has emerged as a solution both to eliminate the spectre of unemployment and to invest in human capital.

Accordingly, we attempt to define the term *self-employed entrepreneur*, distinguish it from related concepts, and then address the procedures for acquiring this status along with its privileges and obligations.

I. The Concept of the Self-Employed Entrepreneur and Its Distinction from Other Related Terminologies

The concept of the self-employed entrepreneur may vary depending on the perspective adopted, whether legal, economic, or social. However, its meaning becomes clearer when contrasted with institutions that bear close resemblance to it. Thus, this section will be examined in two paragraphs: the first will present a definition of the self-employed entrepreneur. In contrast, the second highlights the distinction between self-employment as an entrepreneurial model and other similar terminologies.

1. Concept of the Self-Employed Entrepreneur

At present, all nations, including Algeria, are striving to incorporate diverse human capacities and social groups into driving economic growth through training, development, and the integration of individuals into entrepreneurship. The objective is to generate additional wealth to help revitalise the economy. Thus, efforts have been made to encourage microenterprises, start-ups, and tiny, creative, and innovative businesses, within which the category of the self-employed entrepreneur has emerged as one of the solutions for eliminating the spectre of unemployment and investing in human capital.

Therefore, it is essential to define the term *self-employed entrepreneur* and distinguish it from similar concepts before proceeding to the procedures for acquiring this status and the associated privileges and obligations.

A. Defining the Self-Employed Entrepreneur

[1] Law No. 22-23 of 24 Jumada al-Awwal 1444, corresponding to 18 December 2022, containing the Basic Law on the Self-Employed Entrepreneur, Official Journal No. 85 of 19 December 2022, p. 4.

In outlining the meaning of the self-employed entrepreneur, the legislature relied on a set of criteria, which simultaneously serve as the conditions for acquiring this status. These include the personal criterion, the residence criterion, the financial criterion, and the criterion of the nature of the activity.

The personal criterion associates the concept of the self-employed entrepreneur with every natural person. It appears that the legislator, on the basis of *realist theory*, recognises the legal personality of the natural person alone. The legislator invested in the individual's intellectual and cognitive faculties as the basis for technological and digital creation and innovation, thereby excluding any legal person, regardless of the nature, activity, or type, be it institutions, companies, or bodies.

Furthermore, the individual must have reached the statutory minimum age for employment under Algerian law, which is set at sixteen (16) full calendar years and above. Exceptions apply solely in apprenticeship contracts drafted in accordance with the labour legislation and regulations in force. The individual must also have full mental capacity. This requirement marks a departure from the general principle in Algerian law that determines the age of majority at nineteen (19) years. The minimum legal working age constitutes a matter of public order that must not be violated; otherwise, offenders are subject to criminal liability and the statutory penalties of imprisonment and fines.

Notably, the statutory age established under Algerian law is consistent with International Labour Organisation Convention No. 138 of 1973, which stipulates that the minimum age for employment must not be less than fifteen (15) years. Algeria ratified this convention on 30 April 1984.[2]

According to the economic and financial criterion, the self-employed entrepreneur must carry out work or activities individually, that is, in their own name and for their own account, independently, without having a dependency relationship with another person or being subject to supervision and direction in the management, administration, or practice of the activity by a particular entity or individual.[3]

This activity must generate a financial profit and cannot be merely the provision of free services. However, engaging in this activity does not grant the status of a trader, as the law does not require registration with the Commercial Registry Directorate, provided that the entrepreneur respects and does not exceed the annual turnover threshold, which, according to the 2023 Finance Law, is set at five million Algerian dinars. Some members of the National People's Assembly criticised this amount during parliamentary discussions on the draft law, arguing that it does not sufficiently encourage young entrepreneurs to engage in information technology and related fields, given that the revenues and profits generated in these sectors often exceed the annual turnover limit by several multiples.[4]

Notably, the law relies on the criterion of the nature of the activity by limiting the self-employed entrepreneur's practice to a legally defined and codified list of specific fields to avoid overlaps with other professions, liberal professions, and crafts. These activities include consulting, expertise, training, digital services and related activities; domestic services; personal services; entertainment and leisure services; services directed at institutions; and cultural, communication, and audiovisual services. The law explicitly excludes, by way of absolute prohibition, all regulated activities that require obtaining an administrative licence or accreditation.

This approach contrasts with Moroccan Law No. 13.114, which, in its first article, defines the self-employed entrepreneur as any natural or legal person engaged individually in any activity, whether industrial, commercial, or artisanal, without specifying the nature of the person. The list of these activities is left to be determined by regulatory texts, provided that the annual turnover does not exceed 500,000 dirhams for commercial activities or 200,000 dirhams for services.

Economic, Social and Environmental Council of Morocco, *Self-Employment*, Cana Print Publishing House, 2016, p. 1919. Notably, the law relies on the criterion of the nature of the activity by limiting the self-employed entrepreneur's practice to a legally defined and codified list of specific fields to avoid overlaps with other professions, liberal professions, and crafts. These activities include consulting, expertise, training, digital services and related activities; domestic services; personal services; entertainment and leisure services; services directed at institutions; and cultural, communication, and audiovisual services. The law explicitly excludes, by way of absolute prohibition, all regulated activities that require obtaining an administrative licence or accreditation.

This approach contrasts with Moroccan Law No. 13.114, which, in its first article, defines the self-employed entrepreneur as any natural or legal person engaged individually in any activity, whether industrial, commercial, or artisanal, without specifying the nature of the person. The list of these activities is left to be determined by regulatory texts, provided that the annual turnover does not exceed 500000 dirhams for commercial activities or 200000 dirhams for services.[5]

2. Distinguishing the Self-Employed Entrepreneur from Other Similar Terms

Like many other countries, Algeria has sought to adopt an entrepreneurial approach to advance its developmental economy. This approach has been used to establish the legal and regulatory frameworks governing the entrepreneurial sector by promoting and developing small enterprises.[6] start-ups,[7] and self-employed entrepreneurship.[8]

Each of these types of enterprises is characterised by an independent legal system due to the differences between them in several respects, as follows:

- Small enterprises and start-ups are considered legal entities that take the form of commercial companies operating in the production sector of goods and services. They have an organised structural framework and employ a significant number of workers. For example, tiny enterprises employ no more than nine (9) workers; small enterprises employ up to forty-nine (49) workers; and start-ups do not exceed two hundred and fifty (250) workers.[9] Unlike the self-employed entrepreneur, who is a natural person engaging in economic activities individually and independently, working in their own name and for their own account, and who is legally prohibited from employing workers to fulfil their operational obligations,

- Algerian law requires that self-employed entrepreneurs' annual turnover not exceed five million Algerian dinars. In contrast, small enterprises are legally required not to exceed an annual turnover of four hundred million Algerian dinars, and tiny enterprises must not exceed two hundred million Algerian dinars. Start-ups, however, must meet the annual turnover amount determined by the National Committee for granting the start-up enterprise label.[10]

- Since both small enterprises and start-ups take the form of commercial companies, the Algerian legislature has required them to register in the Commercial Register. As the self-employed entrepreneur is not considered a

[10] Rajae Oumaddoud, "The Legal Framework of Start-ups in Algeria," *Message Journal for Studies and Human Research*, vol. 9, no. 2 (2024), p. 458.

trader, the legislator exempts them from this registration if their annual turnover remains within the limit of five million Algerian dinars. However, suppose that this threshold is exceeded for three consecutive years of activity. In that case, the self-employed entrepreneur is required to register in the commercial register if they wish to continue their business.[11]

- The self-employed entrepreneur carries out economic activities limited to a legally specified list, such as personal services, digital services, consultancy, expertise, training, and others, explicitly excluding regulated activities and liberal professions.

In contrast, the activities undertaken by small enterprises and start-ups are considerably broader, encompassing all goods and services production activities, provided they do not contravene the law or public order.[12]

- The self-employed entrepreneur primarily relies on self-financing and sometimes resorts to small loans, unlike small enterprises, which often seek financial and banking funding.[13] Start-ups frequently attract specific investors, particularly venture capitalists and businesspeople who target innovation and creativity, providing the necessary financial resources for expansion and growth.[14]

- Start-ups originate from ideas of innovation and growth, typically producing new, creative products in the field of information and communication technologies and rapidly developing them to meet the evolving and changing tastes of consumers. This makes start-ups more capable of marketing their products both nationally and internationally. Small enterprises, on the other hand, are economic entities focused on producing goods and/or services. They generally do not prioritise innovation and creativity; instead, they primarily seek to provide the quantity and quality demanded by customers and to respond to this demand, which necessitates expanding the marketing of their products. The self-employed entrepreneur differs in that they do not strive to innovate or develop new products, even though they may possess such capabilities. Instead, they aim to carry out their activities thoroughly and provide the required services consistent with their limited financial resources.[15]

- Algerian law prohibits the seizure of the premises where the self-employed entrepreneur operates owing to unpaid debts or risks arising from their activities.[16] In contrast, small enterprises and start-ups, being commercial companies, can have their assets seized and auctioned to satisfy debts in the event of payment default.

II. Procedures for Acquiring the Status of Self-Employed Entrepreneurs and Obligations

To acquire the status of self-employed entrepreneur and benefit from all the rights and privileges covered by the legal and regulatory frameworks governing this entrepreneurial activity, an individual must undergo a set of mandatory administrative procedures before the authority is responsible for managing and organising self-employed entrepreneur files and must fulfil several legal obligations depending on the circumstances.

1. Procedures for Acquiring the Status of a Self-Employed Entrepreneur

[11] Article 13 of Law No. 22-23 containing the Basic Law on the Self-Employed Entrepreneur, cited above.

[12] Safia Bouzar, *Entrepreneurship Studies*, Faculty of Economic, Commercial, and Management Sciences, University of Algiers 03, academic year 2018/2019, pp. 69–70.

[16] Article 8 of Law 22-23, Basic Law on the Self-Employed Entrepreneur, cited above.

To avoid the bureaucratic obstacles that generally burden investors in public administrations, Algeria is currently working to alleviate or eliminate administrative procedures. To encourage individuals to acquire the status of self-employed entrepreneurs, the registration process in the National Register of Self-Employed Entrepreneurs, meeting the legal conditions stipulated in Article 3 of Law No. 22--23, as previously discussed, has been facilitated. This process comprises three stages:

In the first stage, the applicant submits a registration request to the National Agency for the Self-Employed Entrepreneur, a public institution with an administrative character, legal personality, and financial independence. This agency is responsible for establishing, maintaining, and updating the National Register; managing the electronic registration portal; receiving, assessing, registering, deleting, and reregistering applications; supporting and monitoring the activities of self-employed entrepreneurs; and updating and enhancing the list of activities that qualify for benefits under the laws and regulations related to self-employed entrepreneurship.

The second stage involves examining the registration request and verifying the application documents within a period of three (3) days from the date of submission.

The third stage, following the agency's appraisal of the application, involves notifying the applicant of acceptance or rejection via the digital platform. If accepted, the applicant is registered in the National Register, thereby acquiring the status of self-employed entrepreneur and receiving a card evidencing this status with a unique national registration number. In the event of rejection, the applicant may appeal to the minister responsible for start-up enterprises, who must respond within thirty (30) days.[17]

Notably, pursuant to Articles 22, 23, and 24 of Executive Decree No. 23--197, the National Agency for the Self-Employed Entrepreneur may remove a self-employed entrepreneur from the National Register of Self-Employed Entrepreneurs and revoke their entrepreneur status card in the following cases:

- A personal request for removal is submitted by the self-employed entrepreneur to the agency or sent via the electronic portal.
- If the annual turnover exceeds the legally prescribed amount of five million Algerian dinars for three consecutive years.
- Reasons for or impediments prevent self-employed entrepreneurs from practising their activities.
- In the event of the self-employed entrepreneur's death.

In any of these cases, the agency issues a reasoned deletion decision, which is personally communicated to the entrepreneur and to all entities benefiting from the privileges associated with the entrepreneur card, which is automatically cancelled, particularly the tax authorities, postal services, social security bodies for nonsalaried workers, and banking institutions within fifteen (15) days. The removed entrepreneur may file an appeal with the minister responsible for start-up enterprises, who has the authority to respond to the appeal within thirty (30) days, whether concerning the refusal of registration or removal.[18]

[17] Articles 15 to 22 of Executive Decree 197-2023 dated 25 May 2023, which defines the list of activities eligible for benefits under the Basic Law on the Self-Employed Entrepreneur and the procedures for registration in the National Register of Self-Employed Entrepreneurs, Official Journal No. 37, issued 4 June 2023.

[18] It is worth noting that although the legislator did not explicitly mention the possibility of judicial appeal against decisions to refuse registration or remove an entrepreneur, it is considered permissible for the self-employed entrepreneur to file an administrative lawsuit seeking annulment of these decisions due to their administrative nature. These decisions are issued by administrative bodies (the National Agency for the Self-Employed Entrepreneur is a public institution of an administrative nature, and the Minister responsible for start-ups is also a central administrative authority) before the administrative courts.

1. Legal Obligations to be Respected

The self-employed entrepreneur is bound by a set of obligations that help organise their activities and ensure compliance with the laws and regulations in force in Algeria. These obligations include the following:

A. Filing Tax Declarations and Paying Due Taxes

The self-employed entrepreneur, as a taxpayer, is required to submit a declaration of existence to the competent regional tax inspection office within thirty (30) days from the commencement of their activity. Failure to submit the declaration within the specified period results in the imposition of a very minor fine intended solely as a deterrent.

The tax identification number obtained following the declaration plays a crucial role in indicating the legal status of the self-employed entrepreneur's activity, confirming whether it is officially registered with the tax authority. This obligation is supposed to assist the self-employed entrepreneur in invoicing for services provided to companies and institutions, thereby enhancing business credibility, expanding the scope of activity, and generating a good income. However, the law does not explicitly impose this obligation as mandatory.[19]

However, the law does not specify a standard invoice format that the self-employed entrepreneur must issue, whether it is a regular invoice or one with particular characteristics to be observed.

According to Articles 182, 183, 194, and 365, the self-employed entrepreneur is required to submit without delay a series of tax declarations to the tax authorities, particularly the declaration of existence, the estimated annual turnover declaration, and the final declaration of the actual annual turnover. These declarations must be submitted via specific forms available on the General Directorate of Taxes website. Failure to submit these declarations within the legal deadlines results in fines ranging between 10% and 20% if the delay exceeds a whole month. Additionally, the entrepreneur is obliged to pay the due taxes related to the annual single lump-sum tax, with the option to pay in whole or in instalments depending on their financial situation.[20]

B. Not Exceeding the Legally Prescribed Annual Turnover Threshold

Suppose the self-employed entrepreneur's annual turnover exceeds the amount of five million Algerian dinars (5 million DZD), as outlined in Law No. 22--24 dated 25 December 2023, which contains the Finance Law for 2023, for three consecutive years. In that case, the entrepreneur must register with the commercial register if they wish to continue their activity. However, if the turnover remains below the prescribed amount, the entrepreneur is exempt from mandatory registration in the Commercial Register, thus facilitating the lawful and organised exercise of their activity.[21]

C. Maintaining a Simple Accounting Record

The self-employed entrepreneur must keep a simple accounting ledger to record the financial and accounting transactions related to the exercise of their activity. This ledger must include entries of both income and expenses related to their work. The ledger must be numbered and stamped by competent tax authorities and must be free from any erasures or defacement.

Section Two: Incentives Granted to the Self-Employed Entrepreneur and the Challenges They Face

[19] Fatiha Ben Azzouz, "The Self-Employed Entrepreneur System and Its Privileges in Light of the Provisions of Law 22-23," *Journal of Legal and Social Sciences*, vol. 8, no. 3 (2023), p. 1081.

[20] General Directorate of Taxes, Single Lump-Sum Tax System, issued 24 October 2024, accessed 1 June 2024, www.Mfdgi.

[21] Bouazza Nadira, cited above, p. 571.

To encourage self-employment and facilitate the exercise of economic activities, self-employed entrepreneurs are granted a set of incentives designed to foster initiative and innovation in their field. These privileges act as motivations to support entrepreneurship and enable young people to enter the labour market in an official and organised manner.

However, despite these incentives, self-employed entrepreneurs face several challenges that hinder the continuity of their work, which will be analysed in the following two subsections.

First – Incentives Granted to the Self-Employed Entrepreneur

According to Law No. 22-23 dated 18 December 2022, the self-employed entrepreneur enjoys several privileges aimed at encouraging self-employment and facilitating economic activities, including the following:

- The self-employed entrepreneur is exempt from compulsory registration in the Commercial Register, which simplifies the initiation of activity without complex bureaucratic procedures.

- The self-employed entrepreneur is subject to the single lump-sum tax system, which is a simplified tax that combines professional activity taxes, value-added taxes, and gross income taxes. This tax is set at a rate of 0.5% when the declared annual turnover does not exceed five million Algerian dinars (5,000,000 DZD). Despite the relatively low tax burden, during parliamentary discussions on this law, several members of the National People's Assembly indicated that it fails to sufficiently incentivise young entrepreneurs to declare their entrepreneurial activities and recommended either exemption or reduction of this tax.[22]

- The self-employed entrepreneur may open a commercial bank account specifically for their activity, despite not being registered in the Commercial Register. This facilitates the management of funds and various financial transactions and enables self-employed entrepreneurs to market their goods and services, export them outside Algeria, and receive export revenues in foreign currency.[23]

- The self-employed entrepreneur has the right to conduct their activity from their residence or from shared workspaces, providing flexibility in organising their work. Notably, the residential dwelling used as the place of activity is protected from seizure by creditors to satisfy debts, even if those debts arise from the entrepreneur's activities.[24]

Second – Difficulties Hindering the Self-Employed Entrepreneur in Practising Their Activity

Self-employment is considered an important driver of economic development, especially under current conditions that require the integration of informal activities into the formal economy. However, to achieve this goal, multiple obstacles that complicate the activities of the self-employed entrepreneur must be eliminated. These difficulties are related to financing, management, innovation, marketing, and sustainability compared with start-ups, which enjoy greater opportunities for the financial support and resources necessary for growth and expansion.

1. Difficulties Hindering Self-Employed Entrepreneurs in Financial Financing and Resource Management

A. Financing Problem

[22] Ahmed Lamine Menagli, "The Basic Law on the Self-Employed Entrepreneur: A New Legal Framework for Entrepreneurship in Algeria," *Journal of Legal and Political Thought*, vol. 7, no. 1 (2023), p. 1138.

[23] Fatiha Ben Azzouz, cited above, p. 1080.

[24] Amel Bougra, "A Review of the Newly Introduced Self-Employed Entrepreneur System under Law No. 22-23," *Journal of Research in Contracts and Business Law*, vol. 9, no. 3 (2024), p. 214.

Financing is among the most significant obstacles facing self-employed entrepreneurs, particularly since the financial sources on which they rely are almost limited to personal resources, which are insufficient to cover the risks they may encounter in the market or rising costs. These resources also do not help expand their capabilities or passion for developing their activity. The self-employed entrepreneur also fears dealing with banks for loans because high interest rates do not encourage business flourishing. Furthermore, banks themselves do not provide funding in the absence or insufficiency of collateral securing the loan, and it is well known that the self-employed entrepreneur has limited financial resources.[25]

B. Lack of Experience and Knowledge in Financial Management

The self-employed entrepreneur often has limited experience in managing finances and forecasting financial risks related to the balance of income and expenses, which may lead to instability in annual turnover.

1. Difficulties Faced by the Self-Employed Entrepreneur in Human Development

The self-employed entrepreneur faces several challenges in human development that affect their ability to enhance skills and expand their business scope. These challenges range from a lack of training and institutional support to psychological pressures and difficulty accessing information. The main challenges include the following:

A. Lack of training, education, and consultation

The self-employed entrepreneur frequently struggles to develop their training skills due to the scarcity of institutions providing services tailored to self-employment or the high costs of available training programmes, which often exceed the financial capacity of the self-employed entrepreneur. This hinders the acquisition of the specialised skills demanded by the market.

Additionally, the self-employed entrepreneur suffers from the absence of institutional support from either public or private bodies that could finance their professional projects, offer resources, or provide necessary consultancy to upgrade and refine professional capacities, resulting in a lack of continuity in professional development.

B. Weak Communication and Awareness

There is inadequate communication and awareness regarding the self-employed entrepreneur system, leading entrepreneurs to not fully understand their rights and obligations, which consequently limits their ability to benefit from available programmes.

C. Psychological Fatigue and Financial Pressure

Many self-employed entrepreneurs experience psychological and financial stress due to unstable turnover and profits, which negatively affects their ability to focus on skills development and improve their performance.

D. Difficulty Accessing Information

The self-employed entrepreneur encounters difficulties in accessing essential information about the market and available development opportunities, making it challenging to make informed decisions regarding investments in education and training.

However, self-employed entrepreneurs can overcome the limitations of the information system through several effective strategies that contribute to improving business management and increasing efficiency. Improving

[25] Soumia Taleb, Sharifa Jaadi, Maryam Ghazal, "Small and Medium Enterprises in Algeria: A Survey Study," *Eliz Journal of Research and Studies*, vol. 6, no. 2 (2021), p. 216.

communication between self-employed entrepreneurs and authorities requires efforts from both sides, including establishing effective communication channels, organising workshops, and developing an integrated information system.

These measures help enhance trust and facilitate administrative procedures for self-employed entrepreneurs, contributing to a more stable and effective working environment.

Conclusion

The self-employed entrepreneur law represents a modern mechanism enacted by the legislature alongside other entrepreneurial entities, such as small enterprises and start-ups, aimed at strengthening the youth labour market by providing opportunities to integrate informal activities, especially in the digital sector, and structuring them legally. Through this framework, the self-employed entrepreneur enjoys a range of rights and privileges in exchange for compliance with certain obligations.

Despite the encouragement provided by the self-employed entrepreneur law in facilitating youth access to the economic field and playing a vital role in stimulating innovation and economic development, many challenges have emerged that have caused many young people to reconsider engaging in self-employment.

Among the key recommendations are as follows:

- Eliminate bureaucracy within the banking sector to facilitate access to loans for self-employed entrepreneurs to finance their projects.
- Establish incentive mechanisms for financial institutions (banks and credit institutions) to encourage dynamic participation in financing self-employment.
- The nominal list of self-employed entrepreneurial activities should be regularly updated to encompass emerging market activities and thus limit informal practices.
- Expanding business incubators and starting up nurseries across all regions of the country.
- The annual turnover threshold for self-employed entrepreneurs should be increased to support investment development and advance their activities.
- Organise national and regional workshops and sessions to evaluate the outcomes of entrepreneurial activities, especially self-employment, and assess their impact on economic development, unemployment reduction, job provision, and financial growth.

Acknowledgment

The author extends sincere appreciation to Faculty of Law and Political Science University of Mascara, for providing academic support and resources that facilitated this research. Gratitude is also expressed to colleagues and experts in environmental and maritime law whose feedback and insights significantly enriched this work.

Conflict of Interest

The author declares that there is no conflict of interest related to the research, authorship, or publication of this article.

Keywords	Deviance, juvenile delinquency, rehabilitation, reintegration

Abstract

Juvenile delinquency represents one of the most prominent social phenomena that disrupts the social order in any given society. It has been, continues to be, and will remain a fertile subject for researchers, as it constitutes a social problem from which various countries worldwide have long suffered, regardless of their developmental levels and standards. This is due to the complications inherent in this problem, which contribute to hindering the wheel of societal progress and development. While punishment for adult offenders (those with criminal capacity) involves their placement in correctional institutions established by the state for this category of criminals and deviants, the legislation of numerous countries, including Algeria, has entrusted the examination of juvenile deviance to specialised authorities in locations distinct from those designated for the placement of other criminals. Consequently, special institutions have been established for this demographic according to the nature and severity of the deviance. Among these institutions are those termed rehabilitation centres, which constitute one of the reformative institutions that the state has adopted to address the phenomenon of juvenile delinquency. Their primary objective is to rehabilitate juveniles and ensure their departure from the criminal trajectory, which may lead them to undesirable consequences if left without reform. Additionally, rehabilitation centres possess other duties and functions that will be addressed throughout forthcoming research.

Introduction:

Reformative institutions are defined as residential facilities that accommodate a category of juveniles whom the court orders to be placed therein. These are juveniles who have been deprived of ordinary care within their original families as a result of family breakdown, poor economic circumstances, environmental corruption, or severe juvenile deviance that necessitates temporary isolation until treatment can be provided away from external influences. These services are tasked with providing juveniles with moral and physical education, as well as academic and vocational training, to reintegrate them into society in accordance with official programmes prepared by designated ministries. These institutions are categorised into three types: open, semiclosed, and closed institutions. Each institution comprises departments for reception, placement, supervision, and aftercare. Rehabilitation centres constitute one type of institution.

On this basis, we can pose the following research problem:

- **What do we mean by rehabilitation centres? What are their operational mechanisms, and what constitutes their role?**

1. Definition of the Institution: The specialised rehabilitation centre in "Ain Laloui" is a public institution with a legal personality and financial autonomy. It was established pursuant to Executive Decree No. 89/85 dated 02/05/1989 and operates in accordance with Order 75/64 dated 26/09/1975, which established services and centres specialised in childhood and adolescence care. This institution specialises in receiving juveniles under 18 years of age who have been subject to one of the measures stipulated in Article 144 of the Criminal Procedure Code.

- The rehabilitation centre is located in the municipality of "Ain Laloui," which is situated approximately 15 kilometres from the wilaya of Bouira and 7 kilometres from the city of Ain Bessam on National Road No. 18.
- This institution is situated in a rural agricultural area with an estimated population density of approximately 7,000 inhabitants.
- It is bounded to the north by "Madani Saleh" Street, to the south by the municipal stadium in Ain Laloui and the National Office for Animal Feed, to the east by "Mohamed Bairi" Primary School, and to the west by agricultural land.
- This institution was inaugurated on 31/10/2002, when it received its first group of children.
- The centre accommodates approximately 120 juveniles.
- It is considered the largest centre in Algeria, and admission to the centre is conducted according to the following conditions:

In accordance with Article 8 of Order 75/64, the conditions for accepting juveniles at the centre are as follows:

- The juvenile must be subject to an educational measure;
- The juvenile must be physically and mentally sound and not suffer from any physical or mental impairment;
- The age of the juveniles must be between 14 and 18 years.

2. Organisational Structure of the Institution: Institutions are divided into three main structures, which are as follows:

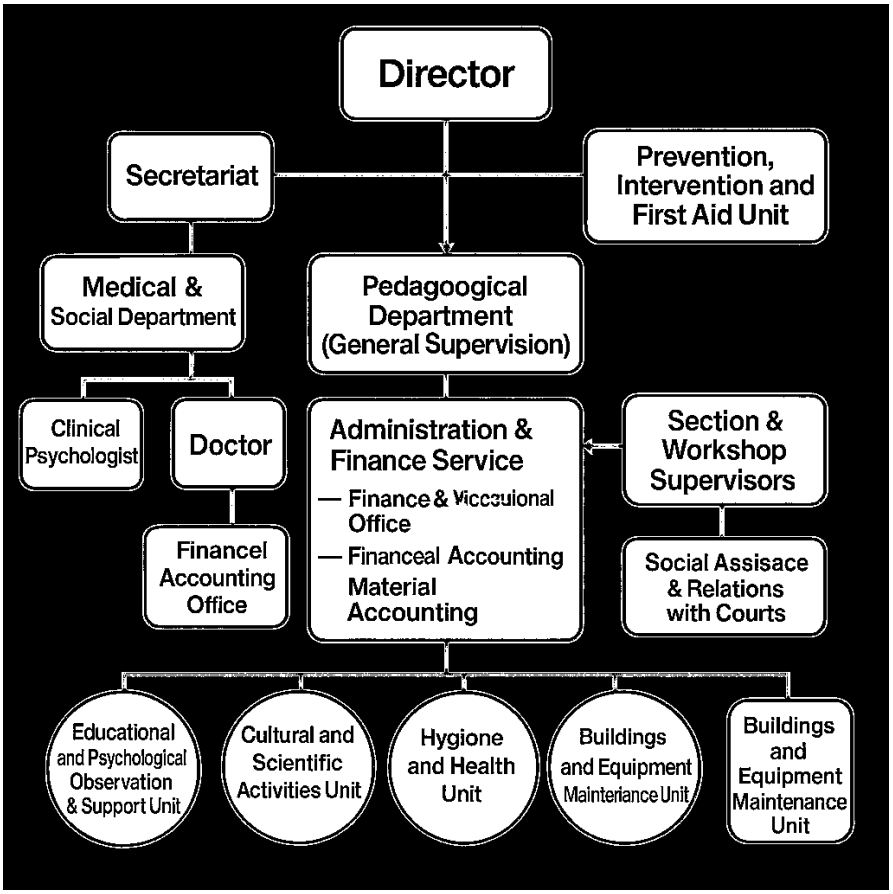
a. Physical Structures: The centre contains the following facilities:

- Administration: ten (10) offices;
- Supervision: one (01) office;
- Economic services: two (02) offices

b. Human Structures: The following chart illustrates the human resources present at the center.

Figure 1:

*Administrative Organisational Chart of the Services of the **Specialised** Rehabilitation Centre in Ain Laloui (Bouira Province)*



c. Services and Departments:

I. Services: The centre contains three services, which are as follows:

a. Observation Service: This service conducts a study of juveniles' personalities through direct observation of their behaviours, in addition to medical and psychological examinations from their admission for a period ranging from 03 to 06 months as a maximum possible duration. Among the objectives of this service are working to adapt the juvenile to the new environment within the centre.

b. Rehabilitation Service: This service provides juveniles with moral education and works to prevent their deviant behaviours by refining and correcting them, alongside academic and vocational training, to achieve social reintegration.

- **Academic training:** An external institution ensures the academic training of juveniles if they meet the conditions of age and level. It aims to provide juveniles with a culture of participation and engagement in study sessions, as well as ensuring education that allows each pupil to progress according to their ability.
- **Vocational training:** This allows juveniles to acquire a profession that suits their abilities for the purpose of social and economic reintegration. The juvenile receives a vocational training certificate from the vocational training center.

c. Post-Treatment Service: This service works to monitor juveniles' integration after they depart from the centre and maintains continuous contact with juveniles' guardians, encouraging them to establish permanent dialogue with their child or the juveniles entrusted to them to prevent them from making mistakes again.

II. Departments: The centre contains two departments: the literacy department and the level improvement department.

a. Literacy Department: This is supervised by a retired teacher who provides a primary programme specific to the juveniles' level by teaching them the fundamental principles of language, arithmetic, grammar, history, geography, and Islamic education.

b. Level improvement department: This department specialises in those with a seventh-year level and above, where they study Islamic education, history, geography, civic education, and sometimes French from 08:00 in the morning until 16:00.

3. Actual Activities and Programmes of the Institution According to Each Specialisation and Each Case:

I. Categories of Deviant Juveniles at Institutions: There are two categories of juveniles at institutions: delinquent juveniles and juveniles exposed to moral danger.

a. Delinquent juveniles: These juveniles commit offences such as theft, carry prohibited weapons or drugs, and carry bladed weapons, among other deviations and crimes that are punishable under Algerian law.

b. Juveniles Exposed to Moral Danger: The age of this category ranges from 8--12 years, and they are victims of family breakdown, such as divorce or the death of one or both parents, and those who are found on the street without a guardian, sponsor, or shelter.

II. Rehabilitative Programmes and Activities: Several rehabilitative programs and activities contribute to juveniles' reintegration and adaptation within the center, in addition to the multidisciplinary team that assists in their rehabilitation.

a. Rehabilitative Programmes: Several workshops contribute to this, which are as follows:

- **Basketry Workshop:** In this workshop, juveniles execute specific educational techniques through forms and subjects of an aesthetic and artistic nature, where they are supervised by an educator and receive professional certification.
- **Computer Science Workshop:** This workshop provides preparatory training for juveniles within the centre and develops their knowledge, abilities, and talents.
- **Handicrafts Workshop:** This workshop develops the abilities and talents of juveniles to enable their integration into social life through conducting educational activities and implementing pedagogical programs supervised by an educator.
- **Confectionery-Making Workshop:** In this workshop, juveniles are trained in making various confectionery items, and the internship duration ranges from 6 months to 12 months. The juvenile is granted a training certificate in coordination with the vocational training centre, according to the agreement concluded between them, to integrate the juvenile into the social environment.

III. Multidisciplinary Team: The multidisciplinary team consists of the following:

a. General Supervisor: The general supervisor is assigned under the authority of the institution director with the following responsibilities:

- Responsible for discipline and internal order in the institution;
- Ensuring security and cleanliness in feeding and accommodation structures;
- Correspondence with juveniles' families and courts.

b. Principal educator: Her duties include the following:

- Implementing prescribed programmes;
- Participating in meetings;
- Supervising trainees.

c. Educators:

- Formulating pedagogical programmes and implementing them for juveniles;
- Taking responsibility for the physical hygiene of juveniles;
- During their movement outside the centre, juveniles are organised.

d. Assistant Educators: These are:

- **Assistant Workshop Educator:** Implements prescribed programmes and assists the specialist educator in their duties within the handicrafts workshop.
- **Literacy educator:** Provides lessons to illiterate juveniles by teaching them the fundamental principles of arithmetic, language, and grammar.
- **Level improvement educator:** Teaches juveniles at the seventh-year level and above from eight in the morning until four in the afternoon, where they study Islamic education, history, geography, and civic education.

e. Assistant Sports Educator:

- An educator specialising in team sports and karate;
- An educator responsible for monitoring and accompanying school-attending juveniles during their attendance at external schools.

f. Specialist educator: Their primary task involves communication with courts:

- Communication with juveniles' families and coordination with them;
- Monitoring juveniles at courts and writing reports about their behaviours;
- Social investigation regarding the social condition of delinquent juveniles.

g. Nurse:

- Health monitoring of juveniles;
- Providing first aid;
- The juveniles were accompanied to the doctor outside the institution.

h. Educational Psychologists:

- Responsible for the administrative and pedagogical organisation of the vocational training branch at the centre;
- Participating in meetings of the multidisciplinary care team and the educational work committee;
- Assists educators and facilitators in preparing pedagogical programmes;
- Conducting interviews with juveniles' families to understand the causes of deviance and directing them to the best methods of caring for their children;
- Individual and group follow-up of juveniles during activities within departments and workshops;

- Participating in educational equipment and its implementation.

i. Clinical Psychologist: Their duties include the following:

- Diagnosing and interpreting mental illness;
- Follow-up on juveniles collectively and individually;
- Interview juveniles' families to understand the causes of deviance and direct them to the best methods of caring for their children;
- Participating in meetings of the multidisciplinary care team and the educational work committee.

4. Tasks and Mechanisms of Rehabilitation Institutions: The tasks of rehabilitation institutions vary according to their specialisations, the needs of juvenile residents, and their conditions. The most important tasks are as follows:

- Providing a balanced and adequate nutritional meal for their physical and mental development.
- Providing appropriate clothing.
- Healthcare and continuous medical examinations.
- Daily outdoor recreation.
- Direct conversation with visitors without barriers.
- The use of remote communication means administrative supervision.

If a juvenile violates the regulations related to the centre or the wing designated for juveniles in the correctional institution, one of the following disciplinary measures is imposed on them:

- Warning.
- Reprimand.
- Temporary deprivation of some recreational activities.
- Temporary prohibition from disposing of their financial earnings.
- Implementation of strict reformative programmes on the basis of the recommendations and expertise of specialists in the field.

In addition, the tasks of rehabilitation institutions are generally and fundamentally represented in ensuring education, re-education, protection, and reintegration for juveniles placed by juvenile judicial authorities while overseeing their health, security, comfort, and development. All of this requires the existence of an integrated staff of employees, including administrators and specialists, who are directly entrusted, each according to their responsibility and specialisation, with care for and ensuring the safety of residents in specialised rehabilitation centres and, subsequently, their reintegration. This process involves numerous plans and programmes implemented by staff according to each case, as residents in centres differ according to the reason for their presence therein. Some juveniles entered the centre due to committing a crime or deviation, whereas others entered for other reasons, such as family breakdown. Consequently, the measures and programmes directed at the deviant category differ entirely from those directed at other categories. It should also be noted that the duration of the reform or re-education process varies according to each case, as there are cases that respond to rehabilitation programmes in a short time, whereas there are cases whose response is slower.

Conclusion:

Despite some deficiencies and obstacles faced by this type of correctional institution (rehabilitation), it cannot be compared with the excellent service it provides to society, as it serves as a vaccination injection that prevents the spread

of the criminal epidemic in the future. Today's delinquency is tomorrow's criminal in the absence of this type of institution. Therefore, the state and concerned authorities should pay greater attention to them and attempt to generalise, develop, and provide them with specialists, given the sensitivity of the demographics being dealt with and under prevailing circumstances.

Ultimately, juvenile delinquency is a serious global phenomenon that represents a significant threat to the stability of families and communities and impedes nations' development and progress because today's children are tomorrow men. If we prepare them properly, they will grow well adjusted and become assets to their homelands and builders. However, if we leave them to the mercy of fate, they become delinquent and deviant. The enormous energy they carry transforms into destructive energy for their homelands and nations, and society will reap nothing from them but afflictions and problems. Instead of being protectors, they become a burden on society. For this reason, we must surround this category with attention and care, provide them with the means of proper upbringing, and search for factors leading to their delinquency to avoid and address them. Today's child is tomorrow's man, and today's deviant is tomorrow's criminal if necessary measures are not taken to reform them.

Recommendations and suggestions:

- Multiple centres should be established across the national territory to address deficiencies and bring institutions closer to citizens.
- Providing correctional institutions in general with all capabilities, whether human or material, to ensure good rehabilitation and reform processes.
- Experienced personnel and specialists in the field of delinquent juvenile care should be employed.
- Benefiting from foreign expertise in the field of delinquent rehabilitation.
- Considering penal individualisation by creating a special apparatus for classifying delinquents according to each delinquent's characteristics.
- The necessity of complete care for the category of deviant juveniles, given the availability of criminal dangerousness, is to intensify necessary reform programmes in addition to aftercare.

In addition, the tasks of rehabilitation institutions are generally and fundamentally represented in ensuring education, re-education, protection, and reintegration for juveniles placed by juvenile judicial authorities while overseeing their health, security, comfort, and development. All of this requires the existence of an integrated staff of employees, including administrators and specialists, who are directly entrusted, each according to their responsibility and specialisation, with care for and ensuring the safety of residents in specialised rehabilitation centres and, subsequently, their reintegration. This process involves numerous plans and programmes implemented by staff according to each case, as residents in centres differ according to the reason for their presence therein. Some juveniles entered the centre due to committing a crime or deviation, whereas others entered for other reasons, such as family breakdown. Consequently, the measures and programmes directed at the deviant category differ entirely from those directed at other categories. It should also be noted that the duration of the reform or re-education process varies according to each case, as there are cases that respond to rehabilitation programmes in a short time, whereas there are cases whose response is slower.

Conclusion:

Despite some deficiencies and obstacles faced by this type of correctional institution (rehabilitation), it cannot be compared with the excellent service it provides to society, as it serves as a vaccination injection that prevents the spread of the criminal epidemic in the future. Today's delinquency is tomorrow's criminal in the absence of this type of institution. Therefore, the state and concerned authorities should pay greater attention to them and attempt to generalise, develop, and provide them with specialists, given the sensitivity of the demographics being dealt with and under prevailing circumstances.

Ultimately, juvenile delinquency is a serious global phenomenon that represents a significant threat to the stability of families and communities and impedes nations' development and progress because today's children are tomorrow men. If we prepare them properly, they will grow well adjusted and become assets to their homelands and builders. However, if we leave them to the mercy of fate, they become delinquent and deviant. The enormous energy they carry transforms into destructive energy for their homelands and nations, and society will reap nothing from them but afflictions and problems. Instead of being protectors, they become a burden on society. Baku, Azerbaijan
E-mail: jafar.mansimi@gmail.com

Issue web link https://imcra-az.org/archive/385-science-education-and-innovations-in-the-context-of-modern-problems-issue-11-vol-8-2025.html

Keywords Education in Azerbaijan; general education schools; 3D animation in education; visual memory; effective learning.

Abstract

The present study investigates the potential impact of integrating 3D animation technologies into the general education system of Azerbaijan and their role in enhancing the quality of teaching and learning. The research adopts a qualitative methodology, grounded in structured interviews and expert evaluations, in order to provide an in-depth understanding of how 3D animation can contribute to pedagogical effectiveness. The study group consisted of five specialists: two education experts, two practicing schoolteachers, and one psychologist. Each participant was interviewed individually through semi-structured interview protocols, and the data were systematically analyzed using internal content analysis techniques.

Findings revealed that the application of 3D animation in classrooms can significantly improve educational outcomes, particularly through the reinforcement of visual memory, comprehension, and sustained attention. The experts emphasized that 3D visualizations make abstract concepts more concrete, thereby facilitating higher retention rates and improving conceptual understanding. Moreover, the study highlighted that 3D animation increases student motivation and engagement, serving as a catalyst for active learning and stimulating curiosity, which in turn creates a more interactive and dynamic classroom environment.

Additionally, the integration of 3D animation was seen as an opportunity to diversify pedagogical methods and support multimodal teaching strategies. Teachers reported that such tools not only enriched the teaching process but also addressed the needs of different learner types—visual, auditory, and kinesthetic. The psychologist involved in the study emphasized the importance of multisensory engagement in supporting cognitive development and reducing learning fatigue. These findings are consistent with global educational trends that promote technology-enhanced learning for effective knowledge acquisition.

The study concludes that the systematic introduction of 3D animation into Azerbaijani schools could become a transformative factor in improving educational quality. However, successful implementation would require teacher training, curricular adaptation, and institutional support. Further longitudinal studies are recommended to measure the long-term effects of 3D technologies on learning performance and cognitive development in diverse educational settings.

1. Introduction

According to Article 12 of the *Law on Education of the Republic of Azerbaijan*, three main forms of education are recognized in the country:

1. formal,
2. non-formal,
3. informal [Law on Education of the Republic of Azerbaijan].

Formal education refers to learning processes that result in a state-recognized education certificate. This includes general education, primary vocational education, secondary vocational education, higher education, retraining, and repeated higher or secondary vocational education. Informal education, by contrast, refers to self-education through independent study, while non-formal education encompasses learning acquired through courses, clubs, and individual lessons that are not accompanied by a state-recognized diploma.

Globally, non-formal forms of education increasingly include the use of **3D animation technologies**. The concept of 3D refers to the process of creating three-dimensional moving images. These three dimensions represent the width, length, and height of an object or scene [Journal of Educational Psychology, 83(3), 318–328]. In the educational context, 3D animation provides learners with a three-dimensional visualization of topics. Moreover, applications have diversified across disciplines, resulting in field-specific concepts such as *3D mathematics*, *3D biology*, and *3D history*.

Although extensive international research has been conducted on the application of 3D animation in education, this issue has not been systematically studied in Azerbaijan. Therefore, the present research constitutes one of the first attempts to evaluate its significance in the local context. Insights were obtained through structured conversations with education experts, teachers, and a psychologist, enabling the formulation of a contextual understanding of the benefits of 3D animation for Azerbaijani schools. The overarching aim of this study was to examine the potential effects of 3D animation on the quality of education in general education institutions of Azerbaijan.

The study employed a qualitative research design and was limited to interviews with experts and practitioners from general education schools in Baku. The research group included specialists with more than five years of professional experience. Participants voluntarily joined the study, providing sincere and accurate responses without external psychological or political pressure. The questions posed were tailored to the aims of the research, and the participants did not perceive the study as a threat to their personal or professional status. It is anticipated that the findings of this research will be considered valuable by the educational community, particularly by the Ministry of Education of the Republic of Azerbaijan.

It is acknowledged that the opinions of participants may reflect subjective judgments and thus introduce potential biases [Creswell, 2016]; [Yıldırım & Şimşek, 2008]. Nevertheless, the study highlights critical dimensions of the use of 3D animation in education.

Existing literature confirms that 3D animation enables the detailed explanation of abstract and complex concepts, making them more accessible, accelerating comprehension, differentiation, and memory retention. As multiple sensory channels are engaged in the learning process, knowledge is stored more effectively and retained over time. 3D animation thus allows learners to penetrate deeper into phenomena while simultaneously creating personalized learning experiences. It also fosters curiosity and motivation, enhancing the enjoyment of learning and improving overall academic outcomes [Catenazzi & Sommaruga, 1999]; [Mayer, 2001]; [Journal of Educational Psychology, 83(3), 318–328]; [Winn, Li, & Schill, 1991].

According to Zahra [2016], 3D animation transforms the educational process into an enjoyable environment. It enhances teachers' capacity to diversify their instructional strategies while also stimulating students' imagination and creativity. Observations further indicate that children often identify with 3D animation characters, adopting them as role models. Consequently, 3D animation functions not only as a formal learning tool but also as an informal educational influence that shapes children's worldview, lifestyle, and behavior.

It is noteworthy that powerful states and corporations also use 3D animation strategically to transmit cultural values and ideologies to children, which may expose them to manipulative influences. This phenomenon is compounded by the fact that most animations are produced in foreign languages, contributing to the infiltration of loanwords into the Azerbaijani language. Therefore, careful pedagogical oversight is necessary when integrating 3D animation into classrooms.

In the contemporary era, communication is undergoing a transition from verbal to visual forms, with the importance of visual communication growing significantly. As Winn [1989] stated, "a picture is worth a thousand words." Similarly, Mengüç [2017] argued that in human communication, words account for only 7% of meaning, tone of voice for 38%, and body language or visual cues for 55%. Given that visuality is central to 3D animation, the effectiveness of information delivery is significantly enhanced, thereby improving the overall quality of learning.

Yusifova [2019] noted that **Generation Z** (born after 2000) represents the first generation of digital natives for whom digital technology is an integral part of life. They are also referred to as the "iGen" or "instant online" generation. According to generational theory developed by Strauss and Howe, this cohort values individualism and tends to live in relative isolation. This perspective reinforces the importance of incorporating 3D animation into education, as it aligns with the interests and learning preferences of modern students.

Supporting evidence is provided by Bamford [2011], who conducted a study across 15 schools involving 740 students (aged 10–13) and 15 teachers. The findings revealed that 90% of students watched 3D films with enthusiasm and interest. Moreover, 86% of students who engaged with 3D animations performed better academically compared to their peers who did not. These students also demonstrated stronger knowledge retention, increased motivation, and a greater propensity for creative thinking and exploration.

2. Limitations and Challenges of 3D Animation in Education

Despite the numerous advantages outlined in the previous section, several challenges and limitations associated with the use of 3D animations in education have also been identified. According to research conducted by the *Progressive Institute of Education and Learning*, the following drawbacks may arise:

- The pace of information delivered through 3D animation may not correspond to the individual learner's rate of comprehension.
- Poorly designed animations may diminish the pedagogical value of critical information.
- Learners may overlook or miss important details embedded within the animation.
- The animated content may not align with, or sufficiently reinforce, learners' prior knowledge and existing information base.

To mitigate these challenges, recommendations include allowing users to control the playback of 3D animations, introducing adjustable video speeds, and ensuring that professional educators manage the presentation and integration of such materials.

3. Existing Problems in the Educational Context

Traditional teaching methods are increasingly being replaced by modern, interactive instructional practices. As noted in the *State Strategy for the Development of Education in the Republic of Azerbaijan*, one of the strategic directions of national education policy is the creation and expansion of an infrastructure that meets modern demands and supports lifelong learning. A crucial component of this direction is the establishment of information and communication technology (ICT)-based infrastructures in educational institutions, aligned with contemporary teaching methodologies.

Although substantial progress has been made in modernizing educational infrastructure under various state programs, analyses show that the use of modern technologies in the teaching process remains limited. In many cases, the systems that have been developed are underutilized. Consequently, the teaching methods employed by most educators do not fully correspond to contemporary educational requirements. A key problem identified is the lack of applied educational content available in the Azerbaijani language.

Given the rapid global diffusion of technological innovations, it is imperative that Azerbaijan leverages international best practices to accelerate the integration of ICT into education. Addressing these issues requires the development of progressive teaching methods and the enhancement of teachers' professional competencies.

4. Research Model

The study was based on a **qualitative phenomenological research design**, which seeks to examine phenomena that are recognized but insufficiently understood in depth, relying on the insights of individuals with relevant expertise [Creswell, 2016]; [Merriam, 2015]; [Patton, 2014]; [Yıldırım & Şimşek, 2008].

In phenomenological research, **interviews** serve as the primary data collection tool. Participants are selected from individuals representing the focus of the study [Yıldırım & Şimşek, 2008]. The aim is not to generalize findings but to capture **diverse perspectives**; therefore, maximum variation sampling was employed [Merriam, 2015]; [Patton, 2014].

Typically, phenomenological studies involve approximately ten participants [Creswell, 2016]; [Yıldırım & Şimşek, 2008]. For the purposes of this research, five individuals were included in the study group: two education experts, two teachers, and one psychologist. The exact number of participants was not predetermined; instead, recruitment continued until new interviews no longer generated novel insights. Data collection was concluded once saturation was reached [Merriam, 2015]; [Patton, 2014].

5. Research Group Composition

The composition of the research group is shown in **Table 1**. Participants were selected based on professional experience (minimum of 5 years), academic standing, and relevance to the subject matter.

Table 1. Research group composition

Participant type	ID codes	Gender (M/F)	Years of experience	Academic status	Number
Education experts	T1, T2	1 M / 1 F	20	Professor, Dr.	2
Psychologist	P	1 F	7	–	1
Teachers	M1, M2	1 M / 1 F	6–7	–	2
Total	–	2 M / 3 F	–	–	5

5.1. Additional description of the research group

As shown in Table 1, **two education experts** participated in the study; **both are male**. One participant has **20 years** of professional experience, and the other has **7 years**. One holds the title of **Professor**, while the other is a **Doctor of Philosophy in Pedagogy**. The study also included **one female psychologist** with **6 years** of experience.

Of the **two teachers** in the research group, **one is male** and **one is female**. They have **6** and **7 years** of teaching experience, respectively. One teacher specializes in **biology**, and the other teaches **Azerbaijani language and literature**.

6. Data collection instruments

Flexible interviewing techniques were employed to probe more deeply whenever responses were unclear or insufficient for the purposes of the study. To this end, **conversation format** and **semi-structured interview questions** were used [Patton M., 2014]. During the interviews, participants were asked **additional, emergent questions** that were **not pre-formulated**, arising naturally in the course of discussion. To gain deeper insight, the interviewer also used **probing prompts** such as: *"What else can you say?", "Why do you think so?", "What else could be added?"* With the participants' permission, all responses were **audio-recorded** to ensure that no information was overlooked.

A **pilot interview** was conducted with one participant to evaluate the adequacy of the questions vis-à-vis the topic; however, these pilot data were **not included** in the results [Cresvell J.V, 2016].

Interview questions:

1. How do you evaluate the use of 3D animations in general secondary schools? Why?
2. In your opinion, how might the application of 3D animations in secondary schools affect the **quality of education**? Why do you think so?
3. As a teacher, do you use 3D animations in explaining topics? Why?
4. When using 3D animations in the teaching process, what **new aspects** do you observe in students' behavior?
5. At which **educational levels** should 3D animations be used more frequently? Which **subjects** support 3D animations most strongly? Why?

7. Data analysis

The collected data were analyzed using **internal content analysis methods**. Categories, themes, and codes were identified; findings are presented with explanatory commentary. Specifically, the data were **coded**, **carefully read**, **synthesized**, and **interpreted**; they were then organized in alignment with the **research questions**, accompanied by the relevant **citations**. Participant **code names and roles** are reported, while personal identities were kept **anonymous** [Cresvell J.V, 2016]; [Merriam S. B, 2015]; [Yıldırım A., Şimşek H, 2008].

8. Validity (credibility)

In qualitative research, **validity** refers to an impartial and unbiased investigation. For this study, both **internal** and **external** validity were addressed [Lincoln Y.S., Guba E, 1985].

8.1. Internal validity (member checking). During and after the interviews, **member checking** was conducted. In the interview phase, the interviewer verified understandings with prompts such as *"Is this what you meant?"* and *"Did I understand correctly?"* After the interviews, participants were provided with summaries of their statements and asked to **confirm** their accuracy.

8.2. External validity and transferability. Since the aim of qualitative research is **in-depth exploration** rather than statistical generalization, generalization is not intrinsic to its nature. Instead, the concept of **transferability** applies [Lincoln Y.S., Guba E, 1985]. Because this study includes the views of **education experts, a psychologist, and teachers** with **a minimum of 5 years** of professional experience, the findings are **transferable** to individuals within these groups in **Azerbaijan** and may inform **future studies** on related topics.

9. Reliability (dependability)

No **leading questions** were used in the interviews; data are reported **impartially**. No identifying information that could reveal participants' identities is disclosed [Creswell J.W. 2007]. As noted, **participation was voluntary**.

Time was dedicated to engaging with respondents **before**, **during**, and **after** the interviews, including both **phone** and **face-to-face** conversations. Because the researcher already knew the respondents, **rapport** was readily established. Interviews were conducted in a comfortable environment, adhering to agreed-upon procedures. Each interview lasted **1–1.5 hours**. With participants' consent, the audio was recorded and later **transcribed**, then **archived** for potential future reference [Lincoln Y.S., Guba E, 1985].

At the outset, participants received an **information sheet** detailing the study's aims, and they were informed of their right to **withdraw at any time**. In qualitative studies, the **researcher's identity, worldview, and experience** shape the inquiry; thus, the researcher should be specially trained to understand the nature of qualitative work. Interview experience, in particular, enables **deeper exploration** of data [Lincoln Y.S., Guba E, 1985].

10. Consistency (coherence)

To verify the **consistency** of the study, an expert evaluated the **alignment** between the **research questions** and the **themes**, as well as the alignment between the **results** and the **research questions** [Yıldırım A., Şimşek H, 2008].

11. Analyses

Participants—including **education experts**, **teachers**, and the **psychologist**—evaluated the application of **3D animations** in education and their effect on **educational quality** in terms of **visual memory**, **comprehension**, **motivation**, and the **enrichment of methods**.

Theme 1. Visual memory

Subtheme 1.1. Retention. Respondents believe that 3D animations **serve visual memory**, since people remember information **better** when they both **hear** and **see** it. As the psychologist noted, if approximately **50%** of the learning process is **visual**, then increasing visuality through 3D animations **supports retention**, thereby enhancing **efficiency** and promoting **effective learning**.

- **Education Expert 1:** "Just as we increase visuality in explaining topics by using pictures, videos, and teaching aids, **3D animations also serve to increase visuality**. Why is it necessary to increase visuality? Humans comprehend better when **more senses** are engaged in the process of acquisition. For example, as a biologist, I am certain that if there are **animated versions** of topics like **chromosomes** and **DNA**, this will deepen not only **learning** but also **retention** and **understanding**. Isn't that the aim of education? We cannot go against **world science**."
- **Teacher 2:** "If I convey any fact **only verbally**, the likelihood of forgetting is higher. But if I **both say it** and **show it visually**, **retention** becomes more achievable. For instance, when a topic explanation is accompanied by a **visual aid** or **video**, I observe that it attracts students' attention much more. In this respect, because **3D animation is a visual medium**, it positively influences **memory**. Therefore, it helps us achieve our goals and **positively affects quality**."
- **Psychologist:** "Learning methods are divided into three types: **visual**, **auditory**, and **tactile**. If humans learn approximately **20%** of what they know by **touch**, **30%** by **hearing**, then the remaining **50%** is learned **visually**. Information acquired visually is remembered better; that is why we often hear statements like, *'I don't remember the topic, but I recall where it was written on the page.'* In **visual learning**, a person retains **more material**. **3D animation** of curricular topics can be beneficial in this regard. Reading something from a book alone does not always yield efficient results. Moreover, **today's children** show special interest in **new technologies**."

Theme 2. Comprehension

Subtheme 2.1. Explaining abstract concepts. All respondents indicated that using **3D animation** has a **positive effect on comprehension**. In their view, 3D animations are particularly valuable in **conveying abstract concepts** to students, as they help when **detailed explanation** and **mental visualization** are challenging. In this way, the **comprehension process** is supported, enabling **deeper exploration** of the subject matter.

- **Teacher 1 (Biology):** "Because my specialty is **biology**, let me give an example from my field. Visuality is essential in biology; many topics that must be studied at a **microscopic level** cannot be explained adequately **in words**. For example, with **verbal explanation alone**, we cannot help students visualize the **structure of the cell**. In such cases, **3D animations** are very effective."
- **Education Expert 1:** "The main point is being able to **see** what is explained. I can tell you **thousands of stories**, but do my words **come to life** in your imagination? I'm not entirely sure. If I **show** you what I want to convey **visually**, you will comprehend it better. Explaining the structures of **glucose** and **sucrose** in words is as different from **tasting** them as verbal explanation differs from **3D animation**—it's a very apt comparison."

Theme 3. Motivation

Subtheme 3.1. Learning through enjoyment. Respondents consider 3D animations to be significant in terms of **motivation** and **drawing students' attention** to the topic. They believe that **student interest** directly influences **educational quality** and that learners are **more eager** when their interests are **taken into account**. Given that the **modern generation** places special emphasis on **digital media** and **moving images**, 3D animations are deemed valuable for **motivating students** and **meeting their interests**. This also **transforms the educational process** into an

enjoyable environment, enabling **learning through enjoyment**. Topics supported by 3D animations become **more engaging** and **novel** for students.

- **Education Expert 2:** "Modern children show a great interest in **new technologies**. Rather than **listening** to someone or **reading** something, they prefer to **watch**. We must **cater to their interests**. When we do so, we can **attract their attention** to learning. If we create the conditions for students to **learn while having fun**, they will show **greater interest** in education. Children are always open to **novelties**, and repeating the **same things** in education—or even in games—bores them. **3D animations** will bring a **breath of fresh air** to their educational experience."

Theme 4. Enrichment of Teaching Methods

Subtheme 4.1. Teachers' professional development. Education experts, teachers, and the psychologist involved in the study also emphasized that the integration of **3D animations enriches teaching methods**. Overreliance on the same instructional approach can render lessons monotonous. From this perspective, 3D animation provides teachers with opportunities to diversify their methodologies, stimulate professional growth, and remind them of the importance of introducing periodic methodological changes. The purposeful enrichment of teaching strategies is one of the key factors contributing to **improved educational quality**.

- **Psychologist:** "We must remember that children quickly grow tired of sameness and repetition. Explaining topics through 3D animations is a different method, but we should not forget that even the best method can become boring if overused—just like eating your favorite food every day until you lose your appetite. Teachers, as the creators of their lessons, should know which method to use, where, and how, and must be able to make changes when necessary."
- **Teacher 2:** "I always try to introduce innovations in my lessons. For this reason, I frequently conduct research. Children love new things. Gathering information about innovations and preparing to apply them in class takes a great deal of time. If ready-to-use 3D animations were provided for teaching, instructional methods would be greatly enriched."

Table 2

Themes, subthemes, and representative participant quotes on the use of 3D animations in education

Theme	Subtheme	Key insights	Representative quotes
Visual memory	Retention	3D animations strengthen visual memory; learners retain more when they both hear and see content.	*Education Expert 1:* "3D animations deepen not only learning but also retention and understanding." *Teacher 2:* "If I say it and also show it visually, memory retention becomes more achievable." *Psychologist:* "50% of learning occurs visually; thus, 3D animations support retention."
Comprehension	Explaining abstract concepts	Animations make abstract or microscopic concepts tangible; they support deeper comprehension.	*Teacher 1 (Biology):* "With words alone we cannot help students visualize the cell's structure. In such cases, 3D animations are very effective." *Education Expert 1:* "Verbal explanation alone is limited; visual demonstration ensures better comprehension."
Motivation	Learning through enjoyment	Students are more engaged when lessons are interactive and visual; interest directly	*Education Expert 2:* "Modern children prefer to watch rather than listen. If we create conditions for learning while having fun, students will show greater interest."

		affects quality.	*Psychologist:* "Visuality directs learners' attention to the topic and sustains motivation."
Enrichment of methods	Teachers' professional development	Animations diversify instructional strategies, prevent monotony, and encourage teacher innovation.	*Psychologist:* "Even the best method becomes boring if overused; teachers must know when and how to vary methods." *Teacher 2:* "If ready-to-use 3D animations were provided, teaching methods would be greatly enriched."

12. Recommendations

Based on the findings, the following recommendations are proposed:

1. **Pilot projects:** Implement 3D animations in several schools as pilot projects. Schools should be equipped with the necessary technology, and animations should be prepared by specialists in collaboration with teachers.
2. **Interactivity:** When designing 3D animations, interactivity should be prioritized. For example, animations may include embedded questions directed at students or knowledge delivered through educational games.
3. **Corporate social responsibility:** Private companies may develop 3D educational materials as part of their social responsibility initiatives. Since 3D animations can also serve as informal learning tools, partnerships with companies should be established to raise their awareness and encourage their participation in educational innovation.
4. **Teacher involvement:** According to one expert, the creation of 3D animations should not be considered a teacher's duty. Instead, teachers should be provided with ready-made materials and trained in how to integrate them into their lessons—similar to how textbooks are delivered to them in complete form.

14. Findings

The qualitative analysis revealed four central themes regarding the application of **3D animations in Azerbaijani schools: visual memory, comprehension, motivation, and enrichment of teaching methods**. Each theme was supported by subthemes and validated through participant narratives. The results are summarized in **Table 2**.

14.1. Visual memory

Participants consistently emphasized that 3D animations strengthen **visual memory** by engaging multiple senses in the learning process. Respondents noted that students remember more effectively when information is **both heard and seen**. According to the psychologist, since **50% of learning occurs visually**, animations significantly enhance retention. Teachers and experts highlighted that animations make complex subjects—such as chromosomes or DNA—easier to remember and internalize.

14.2. Comprehension

The second major theme was **enhanced comprehension**, particularly of **abstract or microscopic concepts**. Teachers explained that in disciplines such as biology, it is difficult to convey cellular structures or biochemical processes through verbal explanation alone. In such cases, 3D animations provide clear visualizations, making abstract ideas **concrete and accessible**. Education experts stressed that animations serve as effective mediators between verbal explanation and student understanding, allowing learners to visualize what is otherwise difficult to imagine.

14.3. Motivation

Respondents also emphasized the role of 3D animations in fostering **motivation and engagement**. Students' interest was described as directly linked to educational quality, with modern learners displaying a strong preference for **visual and digital content** over traditional lectures or textbooks. Experts and the psychologist noted that animations can

transform the classroom into an **enjoyable environment**, where students learn while being entertained. This aligns with global findings that motivation is a critical determinant of educational success.

14.4. Enrichment of teaching methods

Finally, participants viewed 3D animations as a means of **enriching teaching strategies** and supporting **teachers' professional development**. Over-reliance on a single method was described as monotonous and ineffective. Teachers reported that animations could diversify instruction, introduce variety into lessons, and remind educators of the need for **methodological flexibility**. The psychologist warned, however, that even effective methods may become dull if overused; thus, teachers must exercise **pedagogical creativity** in determining when and how to apply animations.

13. Conclusion

The rapid development of modern technologies requires educational institutions to continuously adapt, respond to new needs and expectations, and engage in ongoing renewal. In this context, the integration of **3D animations** into teaching is of particular significance.

The findings of this study indicate that the use of 3D animations in teaching has a **positive impact on educational quality**. Experts, teachers, and the psychologist linked their impact to improvements in **visual memory, comprehension, student motivation**, and the **enrichment of teaching methods**. Respondents agreed that 3D animations support **visual memory**. As noted by the psychologist, approximately **50% of learning and knowledge acquisition occurs through visual means**. Therefore, ensuring long-term retention requires methods that strengthen visual engagement, and 3D animations fulfill this role by enhancing efficiency and facilitating effective learning.

Another factor positively influenced by 3D animations is **comprehension**. Respondents observed that animations are particularly effective in conveying **abstract concepts**, as they allow learners to see and explore what is otherwise difficult to imagine. In this way, comprehension is reinforced, and opportunities for deeper investigation arise.

The results also demonstrate that the use of 3D animations is crucial for **stimulating student interest**, which directly influences learning quality. When student curiosity is met, learning becomes more effective and enjoyable. In fact, 3D animations transform the classroom into an **engaging and entertaining learning environment**, enabling students to **learn through enjoyment**.

Finally, the introduction of 3D animations contributes to the **enrichment of teaching methods** and supports **teachers' professional development**. All members of the research group viewed 3D animation as a means of diversifying instructional strategies, thereby enhancing teaching quality.

In conclusion, the adoption of 3D animations in Azerbaijan's general education schools has the potential to significantly improve the quality of learning by strengthening visual memory, supporting comprehension, enhancing motivation, and enriching pedagogical methods. However, for successful implementation, **pilot projects, teacher training, infrastructural investments, and inter-institutional cooperation** are essential.

Acknowledgment

The author expresses sincere gratitude to the education experts, schoolteachers, and psychologist who actively participated in this study and provided valuable insights. Their contributions were essential for ensuring the comprehensiveness of the research. The author also acknowledges the support of TAM Teaching Advancement Matrix (TAM) for its role in facilitating the conceptual framework of this study.

Conflict of Interest

The author declares **no conflict of interest** related to this research.

Keywords E-Government; Digital Economy; Communication Infrastructure; Internet Accessibility; Legal Frameworks; Data Protection; Governance Transformation; Policy Challenges

Abstract

The emergence of the digital economy has underscored the pivotal role of e-government as both a catalyst and prerequisite for sustainable socio-economic development. This paper provides an analytical study of e-government as a structural foundation for enabling digital transformation, with a focus on its conceptual underpinnings, defining characteristics, typologies, and necessary conditions for implementation. The study investigates the mechanisms that support effective adoption and critically examines the opportunities and constraints associated with integrating e-government within developing and transitional economies.

The analysis demonstrates that the successful establishment of e-government relies fundamentally on a robust communication infrastructure, universal internet accessibility, and the availability of advanced technological tools. Beyond technical requirements, institutional preparedness and comprehensive legal frameworks emerge as indispensable elements for ensuring transparency, accountability, and the protection of sensitive data. The study emphasizes that safeguarding data confidentiality, reinforcing cybersecurity protocols, and fostering public trust in digital platforms are critical to the long-term sustainability of e-government initiatives. Furthermore, the findings reveal that e-government extends beyond a mere technological shift, representing a governance paradigm that enhances efficiency, strengthens institutional performance, and facilitates inclusive access to public services. In addition, e-government is shown to be a strategic enabler of the digital economy by reducing administrative costs, promoting innovation, and creating favorable conditions for entrepreneurial ecosystems. However, the research also highlights persistent challenges such as the digital divide, resistance to institutional change, limited financial resources, and fragmented regulatory approaches that impede full-scale implementation in many contexts.

By situating the discussion within global best practices while considering regional specificities, this paper contributes to the academic and policy-oriented discourse on digital transformation. The insights presented are particularly relevant for policymakers, economic planners, and international organizations seeking to strengthen the foundations of the digital economy through e-government. The research concludes that a holistic strategy—encompassing infrastructure development, legal harmonization, institutional capacity-building, and citizen engagement—is required to maximize the transformative potential of e-government in driving sustainable economic modernization.

Introduction

The tremendous advancements in information and communication technology (ICT) have brought about profound changes in various aspects of life—whether at the individual, family, societal, economic, or environmental level. These developments have directly altered the methods and tools of conducting economic activities, giving rise to what is known as the digital economy. The impact of this transformation has been largely positive, as the shift toward a digital economy is capable of generating new dynamics that enhance the economic interests of nations. It can be argued that the current era is indeed the era of the digital economy.

The growing attention to digital transformation stems from the remarkable achievements of technological progress, particularly the rapid diffusion and widespread use of the Internet. This information revolution has introduced new concepts and patterns, including e-management, e-media, e-commerce, and e-government, with e-government being among the most significant outcomes. ICT has necessitated the modernization of government institutions to align with global developments by adopting innovative approaches to public service delivery. This shift has redefined governmental performance by placing transparency, efficiency, and citizen-centered service provision at the core of public administration.

In light of these transformations, governments and public-sector institutions in both developed and developing countries have begun offering digital services under the framework of e-government to conduct their activities more efficiently and deliver services to citizens.

Based on the above, the research problem of this study can be formulated as follows:

What constitutes e-government?

What are the mechanisms for transitioning from traditional government to e-government?

2. Research Objectives

Through this paper, we seek to achieve the following objectives:

To provide a definition of the digital economy.

To present a theoretical discussion of the concept of e-government.

To identify the mechanisms for transitioning to e-government, along with the benefits and obstacles associated with this process.

3. Research Structure

This study is divided into the following main sections:

Section One: Theoretical framework of the digital economy.

Section Two: E-government—concepts, characteristics, and requirements.

Section Three: Mechanisms of transformation toward e-government, advantages, and challenges.

Section One: Theoretical Framework of the Digital Economy

1. The Emergence of the Digital Economy

With the rapid spread of ICT and the development of the Internet—covering almost all aspects of life, including economic activities—the term digital economy (or electronic economy) has become widespread. This section provides an overview of its main concepts.

The digital economy emerged with the rapid growth of the ICT sector, which contributed to sustained economic expansion. This development coincided with the prosperity experienced by the United States in the early 1990s, marked by rising economic growth, low unemployment and inflation, and budget surpluses. According to a 1999 study by the U.S. Department of Commerce, electronic technologies were central to the exceptional productivity gains achieved by the American economy for seven consecutive years (BOMSEL & GILLES, 1999, pp. 3–5).

These productivity gains can be explained by Joseph Schumpeter's theory of "creative destruction", which describes how innovations disrupt existing structures while creating new assets and job opportunities. The continuous diffusion of innovations forces industries to evolve, as in the case of computers, digital coding, and fiber optics, which threatened the survival of twentieth-century communication monopolies while simultaneously boosting productivity and growth.

The term digital economy gained wide popularity in 1992 under the label of the "Information Superhighway," promoted by U.S. Vice President Al Gore, who emphasized the importance of creating a national information

infrastructure to ensure accessible and affordable information for all Americans. Within a few years, the Internet expanded from serving a small elite to becoming a global phenomenon.

2. Definition of the Digital Economy

The concept of the digital economy can be traced back to the knowledge economy, first introduced by Fritz Machlup in 1962. In this framework, prosperity and growth depend increasingly on the effective use of intangible assets such as knowledge, skills, and creativity as strategic resources for competitive advantage (Rijal & Masai, 2013, pp. 57–58).

Later, Marc Porat introduced the term information economy, describing an economy where information-related labor surpasses traditional sectors like agriculture, industry, and services, especially in advanced economies. By the 1990s, with the advent of the Internet, the term digital economy came into use to denote an economy built on ICT and Internet-driven transformations.

The digital economy can thus be defined as an economy that relies on digital information technologies, employing knowledge and data as new resources for innovation and growth (Al-Razou, 2006, p. 13). It is also referred to as the Internet economy or web economy, encompassing digital customers, firms, technologies, and products (Najm, 2004, p. 204).

3. Characteristics and Foundations of the Digital Economy

According to Al-Najjar (2004, p. 26), the digital economy is characterized by:

3.1. Accessibility of Information: Success in the digital economy depends on individuals' and organizations' ability to engage in digital networks, supported by robust infrastructure.

3.2. Competition and Market Structure: ICT shapes competitive dynamics and market structures at both domestic and international levels, requiring integration across manufacturing, agriculture, education, finance, and investment.

3.3. Macroeconomic Prospects: ICT plays a vital role in accelerating economic growth, capital investment, and domestic and international e-commerce, while reshaping business practices.

3.4. High-Speed Dynamics: The digital economy is defined by rapid communication through satellites and email, demanding agile organizations with real-time information sharing.

4. Elements Shaping the Digital Economy

Several forces influence the structure of the digital economy, notably:

- Supporting digital infrastructure;
- The emergence of the Internet;
- New types of intermediaries;

- Changing marketing preferences of producers and consumers.

5. Manifestations of the Digital Economy

The digital economy has generated several new practices, including:

5.1. E-commerce: Initially introduced in the 1970s through electronic funds transfers among major financial institutions, e-commerce expanded in the 1990s to include online bookings, financial services, and other applications. By 1999, it had permeated nearly all sectors, in addition to the emergence of e-government and e-learning (Nour al-Hidaya & Joudat, 2008, p. 26).

5.2. E-government: The spread of digital technologies and e-commerce reshaped governmental structures, decision-making processes, and performance standards. E-government represents a virtual version of physical government, delivering public services through digital platforms, most notably the Internet.

5.3. E-marketing: Defined as the use of ICT to achieve marketing objectives via digital channels, direct networks, and interactive tools (Ahmed, 2009, p. 132).

5.4. Electronic Investment

Electronic investment refers to the type of investment that relies on the use of information and communication technologies (ICT) to conduct financial and investment transactions and exchange information in real time. This approach reduces investment risks, enhances information transparency, and minimizes both the cost and time of transactions.

Section Two: E-Government—Concepts, Characteristics, and Requirements

The Internet has recently become a driving force across multiple fields, and no country seeking to keep pace with the modern era can avoid moving toward a digital society. While the private sector was the first to adopt e-management—whereby companies leveraged the Internet to expand their markets and streamline transactions—the public sector soon followed. The United Kingdom was among the pioneers, adopting in 1999 a comprehensive strategy to modernize government operations, starting with local authorities and extending to central administrations. This initiative aimed to create a full-fledged e-government framework capable of taking proactive measures to address anticipated challenges rather than reacting after problems arise (Al-Safi & Mohamed, 2021, pp. 30–31).

1. Defining E-Government

Numerous terms are used interchangeably with e-government, such as e-business, e-management, and digital government. According to Al-Rifa'i (2009, p. 308), digital government represents a form of e-business. Differences in definitions largely reflect the perspectives of individual researchers. Below are some of the most recognized definitions:

- United Nations: Defines e-government as "the use of the Internet and the World Wide Web to deliver information and services to citizens." The OECD adds that it is the use of ICT, particularly the Internet, to

achieve better governance, including:

- Interactions between government and businesses (G2B).
- Interactions among governmental entities (G2G).

Interactions between government and its employees (G2E) (Sakhri & Mbareki, 2022, p. 239).

World Bank: Defines e-government as "the use by government agencies of information technologies (such as wide-area networks, the Internet, and mobile computing) to transform relations with citizens, businesses, and other arms of government," with objectives including greater transparency, improved service delivery, and reduced corruption.

International Telecommunication Union (ITU): Defines it as the use of ICT in government to deliver public services more efficiently and to strengthen democratic values and mechanisms.

Alternative Definition: E-government can also be understood as a comprehensive framework and integrated technological system distinct from traditional administration, involving a fundamental transformation of governmental, social, economic, and productive activities. Its ultimate goal is to deliver services more effectively than conventional administration (Al-Suwaifan, 2011, p. 51).

2. Characteristics of E-Government

E-government possesses several features that distinguish it from traditional government, including:

- Reliance on ICT as the primary tool for conducting operations, accompanied by continuous modernization, reducing dependence on paper-based and manual processes.
- Paperless administration: Traditional archives are replaced with electronic records.
- Timeless administration: Services are available around the clock, with most interactions conducted online.
- Improved quality of public services through simplified procedures, streamlined workflows, and reduced duplication.
- Reduced costs of delivering and developing services by utilizing modern technologies, thereby saving time and resources while ensuring quality.

3. Drivers Behind the Emergence of E-Government

The rapid development of ICT, especially in recent decades, has influenced nearly all aspects of life, compelling traditional governments to transition toward digital models. These drivers can be summarized as follows (Abbas, 2009, pp. 46–47):

3.1. Political Drivers:

- The emergence of globalization.
- Political competition to gain public approval through easier service delivery in advanced societies.
- World Bank support for e-government projects in developing countries.

3.2. Technological Drivers:

- The rise of the Internet.
- Decreasing costs of ICT hardware.
- Advances in data encryption technologies, increasing network trust and security.
- The invention of electronic signatures.

3.3. Economic Drivers:

- ✓ The expansion of e-commerce.
- ✓ Governments leveraging ICT to reduce costs.
- ✓ The shift toward privatization projects requiring enhanced communication across sectors.

4. Models of E-Government

Governments may adopt various types of e-government, either simultaneously or gradually:

4.1. Government-to-Citizen (G2C):

This model enables governments to provide citizens with information and services online, including communication, research tools, and enhanced participation (e-democracy and online voting). It also covers essential services such as online payments, appointment booking, and passport or license renewals (Al-Saif, 2013, p. 25). G2C initiatives aim to centralize citizen services in one platform, available 24/7.

4.2. Government-to-Business (G2B):

This involves delivering online services to the business community, including tax filing, company registration, and licensing. G2B services simplify procedures for small and medium-sized enterprises (SMEs), facilitate approvals, and enhance transparency in government-business interactions.

4.3. Government-to-Government (G2G):

This model covers electronic exchanges among government agencies, enhancing internal communication, information-sharing, and workflow efficiency. It serves as the backbone of e-government by promoting integration, coordination, and standardization across public institutions.

4.4. Government-to-Employee (G2E):

This model focuses on services for government employees, such as training, email, e-learning, and secure access to databases. G2E enhances internal efficiency and reduces administrative costs.

5. Requirements for Implementing E-Government

- Successful implementation of e-government necessitates several prerequisites that provide the essential infrastructure for this transformation (Lutfi, 2007, p. 6):
- Availability of advanced computer hardware and software applications supported by integrated ICT infrastructure.
- Accurate identification of government information, data, and forms to be digitized.
- Coordination among government agencies to avoid duplication and conflicts.
- Establishing multiple electronic payment systems (e.g., credit cards, utility bill add-ons).
- A legal framework regulating e-government transactions to safeguard citizens' rights and interests during the transition.
- Launching pilot projects requiring limited restructuring to ensure success before full-scale implementation.
- Continuous monitoring and evaluation of implementation outcomes with transparency.
- Training programs for government employees.
- Establishing an official government website for citizen inquiries and complaints.
- Public awareness campaigns about e-government services and how to use them.
- Political support and financial resources for the responsible implementation team.

Axis Three: Mechanisms of Transition to E-Government Management – Advantages and Challenges

The shift from traditional management to e-government does not occur suddenly or without preparation. Transitioning to e-government provides numerous benefits for both the government and citizens. However, adopting this new model is not without its drawbacks.

1. Stages of Transition to E-Government

There are several successive phases required for shifting from traditional administration to e-government, as follows:

1.1. Publication Stage:

This represents the birth stage, in which efforts focus on supporting, establishing, and developing the infrastructure of networks, equipment, and tools, in addition to publishing information through an online portal via the internet and government networks for members of society (Al-Sharif, 2010, pp. 74–75).

1.2. Interaction Stage:

This stage signifies the growth of data presentation across all government and private sectors. Information is exchanged with the public through websites, resulting in a fundamental transformation in procedures and the presentation of transaction processes and related forms.

1.3. Online Transaction Implementation Stage:

In this stage, services or transactions, or parts thereof, are executed electronically through the internet. This requires agreements with service providers to accept this method of completing transactions, issuing regulations to facilitate the process, and designing websites that include information pages on government services available online (Al-Ma'ani, Ahmed, Asmaa, & Nasser, 2011, pp. 117–118).

1.4. Integration of Government Services to Achieve E-Connectivity:

At this point, the government achieves interconnection among its entities through information exchange. Citizens and businesses can access services via a unified portal that brings together all ministries. Customers can conduct complete and secure transactions online after identity verification. The government's official portal at this stage provides secure access to all ministries and agencies, enabling citizens to reach services based on their needs and priorities. Most transactions are electronically processed through the site.

1.5. Fully Integrated E-Government:

At this advanced stage, the government provides all its services through a single website acting as a comprehensive portal that integrates services based on needs and functions rather than ministries. Institutional barriers are removed in favor of citizens. Individuals and businesses can view their records, manage accounts, and handle financial interactions with the government entirely online with confidence in data security and confidentiality. The government also invests in research, analysis, and public feedback to address shortcomings and further enhance its services (Al-Ma'ani, Ahmed, Asmaa, & Nasser, 2011, p. 118).

2. Advantages of E-Government

E-government is not an end in itself but rather a tool for achieving multiple benefits, including (Halima, 2018, pp. 172–173):

- ✓ Enhancing cooperation and information exchange between government institutions, thereby improving efficiency in achieving governmental objectives through seamless data flows.

- ✓ Saving time, effort, and money for all parties involved.
- ✓ Eliminating bureaucracy and mismanagement associated with traditional government structures by creating new rules, work environments, and efficient service delivery.
- ✓ Transforming from routine executive management to one characterized by innovation, research, planning, coordination, teamwork, productivity, transparency, and constant engagement with citizens.
- ✓ Reducing reliance on large central agencies and committees that consume resources without contributing to productivity.
- ✓ Optimizing the use of strategic resources.
- ✓ Developing communication activities
- ✓ Providing quantitative data to assist decision-makers.
- ✓ Promoting transparency by disclosing government policies and decision-making rationales.
- ✓ Reducing the costs of government services and processes.
- ✓ Facilitating global marketing of products and services.
- ✓ Strengthening inter-agency cooperation (Hossam & Khairbek, 2004, p. 124).

3. Challenges of Transition to E-Government

The transition to e-government faces multiple challenges, categorized as follows:

3.1. Legislative and Regulatory Challenges:

Providing services online requires a proper legal framework to ensure security, privacy, and trust. Without it, citizens may lose confidence if their data is compromised. Thus, specialized legislation is needed, drawing on international best practices (Al-Safi & Mohamed, 2021, p. 46).

3.2. Administrative Challenges:

Studies highlight several barriers, including:

- ➢ Weak planning and coordination at senior administrative levels.
- ➢ Failure to implement necessary organizational changes, such as restructuring departments and workflows.
- ➢ Lack of a clear strategic vision for ICT use.
- ➢ Dependence on outdated managerial methods.

- Resistance to change by employees fearing job insecurity.

3.3. Political Challenges:

The absence of coherent political planning or commitment can hinder adoption. The success of such a national project requires strong political will and support from the highest levels of government (Al-Safi & Mohamed, 2021, p. 47).

3.4. Financial and Technical Challenges:

These revolve around (Ashour, 2010, p. 32):

- High infrastructure costs.
- Limited financial resources for training and acquiring skilled ICT expertise.
- Weak financial allocations for system maintenance.
- Unequal access to internet services due to high usage costs.
- Multiple technical difficulties in ICT applications.

3.5. Human Challenges:

Key issues include:

- ✓ Widespread digital illiteracy in many developing countries.
- ✓ Lack of training and professional development for government employees.
- ✓ Poverty and low income levels limiting access to digital services.

Conclusion

E-government is a fundamental requirement for the digital economy, as it utilizes ICT to deliver public services more effectively. Its successful implementation requires significant resources to ensure quality service delivery and satisfactory performance levels. Nevertheless, obstacles such as digital illiteracy, weak infrastructure, and limited public awareness remain.

Study Findings

- The study reached the following key conclusions:
- Transitioning to the digital economy requires multiple enablers, including ICT, education, and research and development.

- E-government implementation requires sufficient infrastructure, internet access, computer availability, relevant legislation, and business process reengineering.

- E-government provides benefits such as enhanced inter-agency collaboration, economic development support, cost and time savings, and elimination of bureaucracy.

Acknowledgment

The author extends sincere appreciation to colleagues at the University of Algiers 3 for their constructive feedback during the preparation of this study, as well as to experts in digital governance and economics who provided valuable insights that enriched the research.

Conflict of Interest

The author declares no conflict of interest related to the publication of this article.

Recommendations

Based on these findings, the study proposes:

- Enhancing ICT infrastructure to accelerate the digital transition and ensure affordability while supporting R&D
- Enacting legislation to safeguard intellectual property, data security, and privacy.
- Investing in human capital development and eradicating digital illiteracy.
- Raising policymakers' awareness of e-government's role in transparency and citizen engagement.
- Promoting e-government projects through educational campaigns in schools, universities, and institutes.
- Learning from international e-government experiences.

Keywords al-Shaloubīn; Simplification of Grammar; Methodology; al-Tawṭi᾽a; Pedagogy; Arabic Grammar

Abstract

After their conversion to Islam, the people of al-Andalus needed to learn the Arabic language and began seeking instructors who could teach them its grammatical rules. Students travelled to the East in pursuit of this knowledge and returned to their homeland, carrying the diverse approaches to grammar that were prevalent there. When Sībawayh's Kitāb reached al-Andalus, scholars devoted themselves to studying and memorizing it, taking responsibility for its teaching and explanation. However, during the process of instruction, grammarians perceived the difficulty of its rules, as well as its prolixity and complexity. Influenced by the idea of concise works in the East, they began to compose writings modelled on them. A succession of such abridged grammatical works followed, all aiming to facilitate and simplify grammar for learners, but these did not achieve wide acclaim. This continued until the appearance of al-Shaloubīn's al-Tawṭi᾽a, whose title indicates its methodology of making grammar more accessible and easier to comprehend. The study seeks to analyze the pedagogical and methodological strategies employed by al-Shaloubīn in al-Tawṭi᾽a, examining the extent to which they succeeded in reducing the complexity of Arabic grammar, and evaluating its contribution to the grammatical tradition of al-Andalus.

Features of Simplification in *al-Tawṭi'a*:

1. **Introduction to the Book:**

2. **For his work,** Al-Shaloubīn chose a title that suggests simplicity and captures attention. The word *Tawṭi'a* conveys the sense of an introduction, a prelude, or a preparation for those who wish to study Arabic in greater detail. It is as if he is hinting to the learners that this composition is merely an introduction to the vast science of grammar, encouraging them to approach it. Should they wish to advance further, they must turn to more voluminous works. The verb *waṭṭa'a* means "to prepare" or "to pave the way." In *Lisān al-ʿArab*, it is stated that "*al-tawṭi'a* means preparation and facilitation."[1]

3. It is well known that authors usually provide introductions to their works before delving into the subject matter to acquaint the reader with the contents of their compositions. In truth, the choice of a book's title is an art that not every author masters because it influences the reader's perception, draws attention to the work, and leaves a sense of ease that facilitates its perusal. It also stimulates curiosity about what the book contains. This is precisely what Abū ʿAlī intended in naming his composition thus, as he aimed to encourage young learners in the study of grammar after observing their reluctance toward it. This, indeed, falls within the scope of simplification.

4. Method of Citing the Qur'ān, Hadith, Poetry, and Proverbs:

5. Abū ʿAlī al-Shaloubīn employed the well-known categories of exemplification. He cited Qur'ānic verses, Prophetic traditions, Arabic poetry, and proverbs. However, he handled such exemplars with a degree of wisdom so as not to allow them to become a source of grammatical complexity, as was the case in specific works where the exemplars themselves necessitated lengthy explanations. Instead, his citations served the purpose he aimed to achieve, as will be illustrated in the following points.

A – Citing Texts from the Qur'ān and Its Recitations:

The Qur'ān is considered one of the most important sources relied upon by grammarians in formulating the rules of Arabic grammar. Owing to the variety of its canonical and noncanonical (rare) recitations, grammarians found in it fertile ground to express their grammatical disagreements, particularly between the Basran and Kūfan schools. Kūfan grammarians exploited rare recitations and constructed grammatical rulings on the basis of them. In response, basran grammarians rejected these rulings by offering alternative interpretations of the recitations.[2]

The grammarians of al-Andalus paid great attention to the Qurʾān. It is not reported by any Andalusian grammarians that he rejected any of the rare Qurʾānic readings, hesitated to accept them, or dismissed them as authoritative evidence for establishing the rules of grammar, morphology, or phonetics. Indeed, a considerable number of seventh-century Andalusian grammarians cited rare readings extensively.[3] Abū ʿAlī al-Shaloubīn was one of those grammarians who cited the Qurʾān and its recitations, following the path of his teacher al-Suhailī, who "cited the established recitations, whether they were mutawātir (widely transmitted) or rare. "[4]

In his book *al-Tawṭiʾa*, Abū ʿAlī al-Shaloubīn cited approximately ninety Qurʾānic references, employing them to serve the intended purpose of facilitation and simplification by using them as foundational support for the rules presented. Examples demonstrating al-Shaloubīn's use of Qurʾānic citations to simplify and ease grammatical understanding, avoiding complicated derivations, include the following:

1. Al-Shaloubīn rejected the interpretation of the preposition *fī* (in) in the verse "*walāṣlabannakum fī judhūʿi annakhl*" (And We will crucify you upon the trunks of palm trees)[5] as meaning "on," without directly mentioning or addressing the opposing opinion. He stated, "The correct understanding is that *fī* here is to be taken in its usual sense, since the palm trunks are the place of crucifixion."[6] Similarly, regarding the preposition *ilā* in the verse, "*man anṣārī ilā llāh*" (From my supporters to God),[7] which many grammarians interpreted as meaning "with,"[8] al-Shaloubīn refused to depart from its original meaning. He argued that *ilā* is to be understood in its normal sense here, meaning the supporters are associating themselves "to" God, with the implied deletion indicated by the preposition *ilā*.[9]

Furthermore, he did not mention the opinion attributing a silent suffix *hāʾ* in the verse "*fa-bihudāhum iqtidhi*" (following their guidance).[10] Instead, he analysed the *hāʾ* as an absolute object.[11] In an approach intended to ease comprehension, most grammarians consider the *hāʾ* here to be silent and without a syntactic position.

The examples confirming al-Shaloubīn's rejection of the use of Qurʾānic citations as sources of complexity and disagreement among grammarians are numerous throughout *al-Tawṭiʾa*. His purpose in citing the Qurʾān was solely to facilitate understanding.

2- Limiting His Citations to Mentioning the Qurʾānic Verses without Explaining or Commenting the Them:

Al-Shaloubīn refrained from explaining the Qurʾānic verses, opting instead to simply mention the verse relevant to the grammatical point without presenting any opinions from supporters or opponents. He considered such commentary unhelpful, as it could confuse learners and detract from his primary objective of simplification. This approach is consistent throughout the entire book, except for one verse where he found that explanation would clarify the grammatical issue and facilitate the learner's understanding.[12]

3- Citing only the relevant part of the Verse:

The author of *al-Tawṭiʾa* did not cite all the Qurʾānic verses but limited himself to the specific segments necessary for the grammatical point. This practice aimed to spare the learner the difficulty of locating the full text of the citation, facilitate comprehension of the rule, and avoid overburdening the book with extensive Qurʾānic passages that might weigh down the reader. The purpose was always brevity, which is evident in most of the verses cited in the work. For example, when discussing relative pronouns, he quoted only part of the verse, stating: "The correct reading is that of those who read {*mā baʿūḍa*} in the nominative."[13] Similarly, when referring to the particle *bāʾ* that is superfluous in the subject, he cited the phrase: {*wakafā bi-llāhi ḥasībā*}.[14]

In the section on *naʿm* (good) and *biʾs* (bad), he cited part of the verse *n* and said: "What clarifies the implied pronoun in both is *mā*, the indefinite noun without specification, as in {*fa-naʿmmā hiya*}, meaning 'indeed, it is something good.'"[15]

4– Avoiding a detailed discussion of scholars' opinions on the verses cited:

Abū ʿAlī al-Shaloubīn refrained from presenting the opinions of grammarians regarding the Qurʾānic verses he cited in *al-Tawṭiʾa*. However, he did not adhere to this principle in some of his other works. For example, here, he limited himself to the citation by stating: "Among these is {*faʾṭallaʿa ilā ʾilāh mūsā*}, with *ilā* as a preposition governing the accusative, and there is no need to interpret (layyat) as equivalent to (laʿalla)."[16] In contrast, in his *Sharḥ al-Muqaddima al-Jazūliyya al-Kabīr*, he discussed al-Jazūlī's opinion on the matter and refuted it.[17]

5– Avoiding Citation of Rare Recitations:

Al-Shaloubīn was keen to avoid citing rare (shādhdh) Qurʾānic recitations, limiting himself to the mutawātir (widely transmitted) readings in his book *al-Tawṭiʾa*. He did not consistently apply this principle in his *Sharḥ al-Kabīr*. This approach forms part of his overall aim to facilitate learning for beginners. However, there are a few exceptions, such as the verse {*mā baʿūḍa*},[18] which he cited in the nominative case without mentioning that it is a rare reading.[19] This variant is attributed to al-Ḍaḥḥāk, Ibrāhīm ibn Abī ʿUbla, and Qaṭrab.[20]

If we consider his effort to exclude rare recitations from *al-Tawṭiʾa*, we find that in his *Sharḥ al-Kabīr*, he cited the verse {*qul rabb ḥukkim bil-ḥaqq*} with the reading that includes the *bāʾ* pronounced as a *dammah* (u).[21] Similarly, he cited the verse {*inna l-baqara tashābahat ʿalaynā*}[22] pronouncing the *hāʾ* in *tashābahat* with a *dammah*, stating: "*tashābahat ʿalaynā* is pronounced with *fatḥah* when masculine, and with *dammah* when feminine."[23] However, he omitted both verses in *al-Tawṭiʾa* to avoid mentioning disputed readings and confusing beginners. Thus, he effectively excluded rare Qurʾānic citations from complicating grammatical rules, instead using them as a means to facilitate grammar for novices.

B – Argumentation by Prophetic Hadith:

The use of prophetic hadith as supporting evidence differs among grammarians. Early grammarians rejected citing hadith, whereas later scholars—especially those of the Andalusian school—permitted it to the extent that it became one of their defining features.[24] Al-Shaloubīn was among the grammarians of this school; however, in *al-Tawṭiʾa*, he approached the matter with a cautious attitude. He did not reject citing hadith but limited its use, citing only three hadiths throughout the book. The first appeared in his discussion on the attachment of pronouns, where he said: "It is attached as in *ʾannaka*, *ʾannah*, and *kāna*, as in the hadith: 'Be Abū Khuthaymah, and be like him,' and its sisters."[25]

The second hadith was cited when discussing the subject and predicate, where he said: "As in the saying: 'The best words said by me and the prophets before me: There is no god but Allāh. '"[26] The third appeared in his treatment of the feminine, where he stated: "Or its description, as in: 'In every living being there is a reward.'"[27]

This indicates that al-Shaloubīn aimed in this book to avoid disputes among grammarians that tend to complicate grammatical rules for beginners.

C – Emphasis on Citing Arabic Poetry:

A reader of *al-Tawṭiʾa* will notice that its author frequently cited Arabic poetry, referencing ninety-eight complete verses and ten half-verses. When considered solely as citations of poetry by grammarians, al-Shaloubīn's use is moderate compared with others; for instance, Ibn Hishām's *Sharḥ Shudhūr al-Dhahab* contains two hundred and sixty verses. Even if we accept that the number of poetic citations in *al-Tawṭiʾa* is considerable, they all serve the purpose of simplification. Al-Shaloubīn employed these poetic examples solely as illustrations, never presenting a poetic citation before offering several easy syntactic examples. For example, he stated, "The conjunction *faʾ* (then) is invariably required with a nominal sentence whether it involves demand, as in 'If Zayd rises, then God forgives him,' or as in 'If

Zayd rises, then is ʿAmr standing?' or its negation, as in 'If Zayd rises, then ʿAmr is standing,' except when necessary, as in the verse:

Whoever does good deeds, God rewards them,

Moreover, evil for evil, with God, is equivalent.[28]

Elsewhere, he says: "A nominal or verbal sentence containing a pronoun referring back to the antecedent occurs, as in: 'Zayd came, he was laughing,' 'Zayd came laughing,' and 'Zayd came having laughed.' He emphasizes the connection in this construction with the conjunction *wāw*, as in 'Zayd came while he was laughing,' 'Zayd came laughing,' and the verse:

Who wielded swords without gentleness in their hands,

However, there were few slains when they were drawn.[29]

He did not cite the couplet except after illustrating simple, commonly used expressions among Arabs. Moreover, he only took from the couplet what was necessary, often limiting himself to half a line or part of a half-line, so as not to burden the reader with the entire verse, as in his citation of:

إمّا عرضت فبلّغا[30]

Very often, he rejected poetic citations, attributing them to irregularity or poetic necessity. Regarding irregular cases that are not subject to analogy, he stated, "If it is apparent, it occurs only in the general case with the generic definite article *al* or when annexed to what it is part of, as in '*naʿm al-rajul Zayd*' (Zayd is a good man) and '*naʿm ṣāḥib al-qawm ʿAmr*' (ʿAmr is a good companion of the people), and the verse:

فلنعم صاحب قوم لا سلاح لهم وصاحب الرّكب عثمان بن عفّانا

which is memorized but not subject to analogy. "[31]

Poetic necessity, on the other hand, he employed frequently, such as when citing it in his discussion of the light *ʾan* (*an*). He said, "As for necessity, it is permissible not to elaborate on the place of possibility, as in the verse:

"فلمّا رأى أن ثمّر الله ماله وأثّل موجودا وسدّ مفاقره[32]

When he discussed numbers and their annexation, he said, "They are annexed to *māʾa* (hundred), *miʾatayn* (two hundred), *alf* (thousand), and *alfayn* (two thousand), except in cases of necessity, as in the verse:

"إذا عاش الفتى مائتين عاما فقد ذهب المسرّة والفتاء[33]

At times, he called for the omission of irregular forms and their rejection, as he did with the expression "ʾakalūnī al-barāghīth" ("the fleas ate me"). He said, "The markers of the dual and the plural may be retained in irregular forms, as in the verse:

يلومونني في اشتراء النّخيــل اهلي فكلهم ألوم

and in the verse:

ألفيتا عيناك عند القفا أولى فأولى لك ذا واقيــه

which is the language of ''akalūnī al-barāghīth.' Its omission is more eloquent because the pronouns shift from their nominal origin to the prepositional."[34]

Despite the number of poetic citations, poetry is absent from many pages of the book, especially at the beginning, where no poetic examples appear from page 116 to page 136. It is also absent in several chapters, such as the chapter on knowledge, the chapter on emphasis, the chapter on substitution, and others. All of this is for the sake of facilitation and brevity.

D – Citing Arabic Proverbs:

Abū ʿAlī al-Shaloubīn cited only nine Arabic proverbs in his book *al-Tawṭi'a*, and his consistent goal was brevity and facilitation. Therefore, he introduced each proverb only after the grammatical issue was illustrated with syntactic examples, as he did with the Qur'ānic and poetic citations. For example, when discussing the conditions for beginning with an indefinite noun, he said: "Among these is generality in wording and meaning, as in 'كلّ أحد يفعل هذا' (everyone does this), and his statement: 'ثمرة خير من جرادة' (a fruit is better than a locust)."[35]

He clarified the proverb if he found it difficult for the learner, saying: "Among these is when the expression has the meaning of another expression that does not affect its meaning, the noun being indefinite in it, as in: شرّ أهرّ ذا ناب and شيء ما جاء بك إلى مخّ عرقوب, meaning: 'Nothing but evil gnawed this tooth,' and 'Nothing but something came to the sole of ʿUrqūb's foot.'"[36]

Sometimes, he mentioned the proverb without commenting on it, as in his discussion of *tarikhm* (emphatic pronunciation), where he said: "When you pause, the *hā'* is usually pronounced lightly, but it is emphatically pronounced in the *murakhkham* (feminine emphatic), when it is open and connected, as in *'aṭraqa Karā*."[37] He did not frequently cite proverbs in *al-Tawṭi'a*, aiming instead for ease and simplification.

1– Arrangement of Grammatical Topics

Al-Shaloubīn arranged the topics in his book following a method suited to the educational goal of the work. He began with the parts of speech and their components and then moved to distinguish between inflected (*mu'rab*) and uninflected (*mabnī*) forms since Arabic is a language of inflexion. He proceeded with other grammatical chapters, ensuring coherence between connected topics. For example, the chapter on the subject and predicate is followed by the chapter on *kāna* and its sisters, and the chapter on *'in* and its sisters is followed by the chapter on opening and breaking the hamzah of *'in*. In contrast, the verb chapter with triliteral verbal nouns is followed by the *nūnī* verbal noun chapter—which resembles the approach of modern textbooks.

2– Style and Distinctiveness in Presenting the Material and Language of the Book:

The author presented the grammatical material in *al-Tawṭi'a* in a straightforward style, resembling that of an expert teacher. This is unsurprising given his over fifty years of experience teaching Arabic. He gives a clear title to each chapter and then defines, if needed, followed by an easy explanation supported by clear syntactic examples. Occasionally, he includes various linguistic evidence, avoiding overly technical grammatical language mixed with logic. As a result, the language of the book is straightforward and requires little further explanation or clarification; those wishing for confirmation can consult the book directly.

3– Abundance of clear, simple syntactic examples:

A striking feature of *al-Tawṭi'a* is the abundance of simple, clear examples resembling a modern school textbook. This exemplification serves to establish grammatical rules for learners firmly. These examples often precede linguistic citations such as Qur'ānic verses and Arabic poetry. For example, when discussing the pronoun referring back to a noun, he said, "If a noun is mentioned followed by a verb or a noun acting as a verb, and its pronoun or pronoun

substitutes are raised, whether directly or indirectly, the first noun must be nominative at the start, as in: *Zaydun qāma, Zaydun kufiya bihi, Zaydun qāma bihi abhūhu, Zaydun kufiya bi-abīhi,* as well as *Zaydun ḍuriba, Zaydun dhahaba bihi, Zaydun ḍuriba ʾakhūhu, Zaydun dhahaba bi-abīhi.*"[38]

1– Concise Without Deficiency, Avoidance of Redundancy:

Brevity is the primary feature reflecting facilitation in *al-Tawṭiʾa*. The book is concise without compromising grammatical rules, including most of the topics needed by beginner learners. This characteristic appears in several aspects outlined in the following points:

A – Book Length:

The various grammatical chapters are presented in a small volume of no more than two hundred and thirty (230) pages and are easily and concisely delivered. This compact size is encouraging for students of grammar, as it offers material that is easy to approach and memorize, unlike larger books that may intimidate learners and discourage their interest.

B – Concise Presentation of Topics:

Al-Shaloubīn worked to present various grammatical topics succinctly. Most chapters do not exceed two or three pages, such as the chapters on adjectives, emphasis, substitution, *naʿm* and *biʾs*, and others. Some topics are treated in just a few lines, unlike in other books, where they cover many pages. For example, the subject with the object is presented in *al-Tawṭiʾa* in five pages,[39] whereas it is covered alone in ten pages in his *Sharḥ al-Muqaddima al-Jazūliyya*.[40] The chapter on the subject and predicate is about five pages in *al-Tawṭiʾa*[41] However, it extends to eighteen pages in the *Sharḥ al-Kabīr*.[42] This conciseness in grammatical topics serves the purpose of ease and facilitation.

C – Omission of Nonessential Matters in the Grammatical Chapter:

Al-Shaloubīn omitted topics that are not important for beginners—those that learners can do without at the early stages. He focused on the most essential aspects of each topic and left out what he deemed unnecessary for novices. For example, when discussing the subject (*fāʿil*), he did not address its omission, whether permissible or obligatory, nor did he discuss its placement before or after other elements. He also avoided explaining the reason (*ʿillah*) for the subject's nominative case, although he covered all of these in *Sharḥ al-Kabīr*. As for the chapter on dispute (*tanāzuʿ*), which involved many disagreements between Basran and Kūfan grammarians, Abū ʿAlī discussed it simply and easily on just one page.[43] without mentioning any grammarians' opinions.

7– Avoidance of forced interpretation:

The author of *al-Tawṭiʾa* avoided forced or strained interpretations in his book, approaching the Qurʾānic and poetic evidence with a literalist mindset rather than engaging in the grammarians' interpretive disputes. For example, he rejected the Basran grammarians' interpretation of the accusative case of the word فأطّلع in the verses:

لعلّي أبلغ الأسباب أسباب السماوات فأطّلع إلى إله موسى

وإّني لأظنّه كاذبا وكذلك زيّن لفرعون سوء عمله وصدّ عن السّبيل وما كيد فرعون إلا في تباب.[44]

He stated that "*faʾṭallaʿa* is in the accusative case, and it does not need to be understood in the sense of 'layta' (would that)," a simplification aimed at making grammar easier for learners.

8– Use of the Dialogue Style:

Because the purpose of writing *al-Tawṭiʾa* is education and facilitation, its author was required to use a style that attracted learners to the material, especially since they had become discouraged due to books that complicated grammar with logic, excessive explanations, and lengthiness. He chose to rely on a dialogue style, as if teaching without a teacher. Throughout many pages of the book, he imagines someone asking him questions, to which he responds, or he addresses the reader directly. His use of dialogue terms indicates this, such as "*Alā tarā*" (Do you not see?) in: "*Nahu: yaqūmu Zayd in qāma ʿAmr, alā narā anna al-ʿArab innamā taqūlu: ʾanta ẓālim in faʿalta, wa-lā taqūl: in tafʿal.*"[45] Moreover, "*taqūlu*" (you say) directs the address, as in "*wa-taqūlu: man yaqim aqim maʿahu*" (and you say: whoever stands, stand with him).[46] Alternatively, "*qawluka*" (your saying) in "*ka-qawlika: hādhā qāḍin*" (like your saying: This is a judge).[47] In addition, "*fa-kaʾannaka qult: al-khubzah ʾakaltuhā, thumma qult: ʾiyyāhu ʾakaltu, wa-qawluka: thulthu al-khubzah ʾakaltuhā, mumtaniʿ, liʿadam al-ʿāʾid ʿalā al-mubtadāʾ*," meaning:

"It is as if you said: 'I ate the bread,' then said: 'I ate it,' and your saying: 'You ate a third of the bread' is impossible because it does not refer back to the subject. "[48]

Conclusion

al-Tawṭiʾa is among the concise books that contributed to facilitating Arabic grammar and gained popularity among Andalusian scholars. All translators of al-Shaloubīn mentioned this work, noting its distinguished method in citing the Qurʾān, hadith, and poetry; its coherent arrangement of grammatical topics; its clear presentation style; its abundance of simple syntactic examples; its conciseness and avoidance of redundancy; its avoidance of forced interpretation; and its use of the dialogue style.

Acknowledgment

The author would like to thank the Department of Arabic Language and Literature at the University of Oran 1 for providing access to scholarly resources, as well as colleagues who offered valuable feedback on earlier drafts of this research.

Conflict of Interest

The author declares no conflict of interest regarding the publication of this article.

Abstract

Comparative studies represent one of the most dynamic fields within the humanities, particularly in linguistics, literature, and rhetoric. They serve as a fertile ground for the interaction of languages, cultures, and intellectual traditions, producing innovative perspectives that enrich scientific inquiry and cultural understanding. Such studies not only highlight the degrees of relatedness among languages but also illuminate similarities and differences in rhetorical practices and linguistic structures. They further contribute to resolving interpretative problems that may remain obscure within the confines of a single language, while also advancing pedagogy, critical thinking, and cross-linguistic comprehension.

This article explores the rhetorical efforts of Mokhtar Nouiouat, a prominent scholar whose work bridges Arabic rhetorical traditions with French rhetorical thought. The study addresses key research questions: What is Nouiouat's contribution to Arabic rhetorical studies? At what level do his insights manifest their significance? How have comparative approaches shaped the development of Arabic rhetorical thought?

In pursuing these questions, two central aspects of Nouiouat's contributions are emphasized:
1. His development of rhetorical terminology and the methodological approaches to its formulation.
2. His rhetorical perspectives and their intellectual value within the broader field of Arabic rhetorical studies.

Methodologically, this research adopts a descriptive approach, employing systematic analysis of Nouiouat's writings

to evaluate their impact. The findings underscore Nouiouat's role in enriching Arabic rhetorical scholarship, particularly by engaging with French traditions in ways that broadened conceptual horizons and fostered new approaches to metaphor, truth, and rhetorical analysis.

Introduction

In their trajectory toward development and renewal, the sciences tend to follow two methods or pathways: the path of reflection, contemplation, and deep thought, and the path of being influenced by other sciences, whether of a similar nature or somewhat distant. In either case, sciences, whether closely related or more remote, possess inevitable connections dictated by the laws of growth, advancement, and refinement. This seems to be a nearly universal principle across sciences and societies, so long as language, in its broadest sense, remains a unifying factor. The history of Algeria is rich with scholars who authored works across diverse fields and excelled in numerous sciences. Among them were those prolific in their writings and those who composed but little, those who expanded and explained and those who abridged, figures well known and many others all but forgotten. In this article, I address one of the eminent modern scholars of rhetoric who held a significant place and left a notable impact on rhetorical studies. This article is entitled *"The Rhetorical Efforts of Mokhtar Nouiouat: A Reading in His Book Arabic Rhetoric in Light of Contemporary Rhetorical Approaches between French and Arabic Traditions"*.

Rhetoric, as one of the sciences of Arabic, consists of three interrelated arts. This interconnection may be conceived by considering the principal elements actively shaping the rhetorical process: the speaker, the recipient, and the text. The speaker, who generates discourse, must convey a meaning to a particular addressee. This obliges adherence to the system and conventions of language in constructing structures and selecting words that convey the intended meaning, thereby achieving the desired purpose and intended effect. It likewise involves the choice of stylistic patterns that weave together this linguistic construction, shaping its architecture in various ways: some about content and meaning, others to form, and still others to the recipient of the discourse.

The consideration of such dimensions accords rhetoric as a distinguished position within Arabic sciences and elevates it to a high rank. Rhetoric thus operates as the indispensable tool of any speaker wishing to direct a discourse or message. As has been said, rhetoric manifests in many rhetorics; for the standpoint from which a writer proceeds, it determines the conception, purpose, and fruit of rhetoric. On this point, Mokhtar Nouiouat observes that "Western rhetoric was dominated by the theory of art for art's sake. The Greek or Roman poet or writer sought beauty of expression, whereas the Arab poet or writer, in his artistic prose, sought creativity and the enchantment of eloquence."[1]

The principle of "beautiful expression", long adopted by the West, both in antiquity and in modernity, what they referred to as "art for art's sake", differs fundamentally from what ancient Arabs termed "the enchantment of eloquence." Among these two terms lies a vast gulf in both meaning and force. However, through a particular form of

[1] Mokhtar Nouiouat, *Arabic Rhetoric in Light of Contemporary Rhetorical Approaches between French and Arabic Traditions* (Algiers: Houma Publishing and Printing House, 2013), 18.

interpretation, one might establish common ground that allows for a measure of coexistence and convergence. Nonetheless, the evident distinction remains that the Arabic term "the enchantment of eloquence" derives its potency from its capacity for impact and clarity of expression, an eloquence that cannot exist without the presence of additional factors touching multiple aspects of discourse, regardless of its form or genre. In this context, attention was given to the recipient, who constitutes an integral part of the communicative process, as well as to the message itself, how it is delivered and how it is received. All of these elements converge within the domain of rhetoric.

The strength of rhetoric flows from the strength of its sources, from which it is drawn and upon which it is built. Arabs had a profound passion for the Arabic language, its beauty, and its refined aesthetics. For them, the word was the voice of their existence; indeed, it was the very essence of their lives. When the Noble Qurʾān was revealed, they were overawed by it, captivated by its eloquence and by its unrivalled inimitability. They were likewise enthralled by poetry, its splendour of expression, and the power of its composition. Such realities inspired Mokhtar Nouiouat to note: "The sources of Greek rhetoric are epics, theatres, and mythology, whereas the sources of Arabic rhetoric are the Noble Qurʾān, the Prophetic traditions, and pre-Islamic, Umayyad, and Abbasid poetry. Its evidentiary examples are the noble verse from the Qurʾān, the noble prophetic saying, and the poetic line, or couplet, uttered by a poet that astonishes the ear, penetrates the heart, transcends borders as it travels through lands, and thus endures, immortalising both itself and its author."[2]

From this perspective, it may be deduced that the greater the strength of the sources of rhetoric, the greater its standing and the more profound its impact on recipients. This phenomenon was evident in classical Arabic poetry, whose verses travelled far and wide across tribes, regions, and nations. Their renown grew to an extraordinary degree, securing for them an enduring perpetuity, the *Muʿallaqāt*, for instance. These compositions were safeguarded through the diligent preservation of tongues, committed faithfully to memory, and encircled by minds and intellects striving to grasp the subtle meanings concealed within their words and structures.

The question of meaning and expression has long preoccupied Arab and Western, ancient and modern, critics and rhetoricians, who are divided into differing schools and factions over the matter. Some privileged meaning places it above expression, given that meaning precedes expression in conception; words are but representations of the meanings that reside within the mind.[3] These abstract entities require embodiment if they are to be grasped by the intellect through the senses.

Mokhtar Nouiouat devoted the first section of his book to metaphor and its types, a section that follows the pattern established by the ancients when they debated whether literal and figurative usage pertains to expression or to meaning. Notably, Nouiouat treated the word as the counterpart of the idea and ideas as the counterparts of words. For him, "ideas are born of the reasoning mind, and the expression of an idea or of ideas can only come through speech composed of words arranged according to a particular linguistic standard."[4] Moreover, the idea that takes form in the mind as a conception of some matter can only be realised through expression, whether orally or in writing. It is language and writing that embody the image of the idea. This duality of *ideas*–Saussurean inspires word thought, for Saussure established dualities such as *langue–parole* and *signifier–signified* as the point of departure for his linguistic studies. Nouiouat's view of the idea does not depart from the conception already articulated by the ancients: "Whether sensory or abstract, the idea is never without complexity, owing to the particularities that distinguish it in quality, class,

[2] Ibid., 18.

[3] ʿAbd al-Qāhir al-Jurjānī privileges meaning over expression in his words: "Expressions are the servants of meanings." See *Asrār al-Balāgha*, ed. and annotated by Maḥmūd Muḥammad Shākir (Cairo: Maṭbaʿat al-Madanī, 1991), 8. In contrast, al-Jāḥiẓ elevates expression above meaning, declaring: "Meanings are strewn in the streets, known to both the foreigner and the Arab, the Bedouin and the townsman. What truly matters is the proper measure, the choice of words, the ease of utterance, abundance of fluency, sound instinct, and excellence of composition. For indeed, poetry is a craft, a form of weaving, and a kind of representation." See Abū ʿUthmān al-Jāḥiẓ, *Kitāb al-Ḥayawān*, ed. ʿAbd al-Salām Muḥammad Hārūn (Cairo: Muṣṭafā al-Bābī al-Ḥalabī, 1965), 2nd ed., vol. 3, 131–32.

[4] Mokhtar Nouiouat, *Arabic Rhetoric in Light of Contemporary Rhetorical Approaches between French and Arabic Traditions* (Algiers: Houma Publishing, 2013), 21.

type, and related aspects."[5] Thus, the idea is that which revolves in the mind as a conception of a given matter, corresponding to what is described as the signified, the conception, or the mental image.

In this work, our focus is on the following levels:

1. The Level of Terminology

Terminology serves as the key to the sciences; it is the very foundation through which the researcher enters the city of knowledge. Attention to terminology is not a recent development but rather as old as the sciences themselves. It emerges alongside them, sometimes slightly before and sometimes after, and has received remarkable attention from scholars and specialists in every discipline that has arisen across the ages. This is due to its vital role in elucidating scientific issues, expounding upon their questions, examining their complexities and particularities, and addressing the challenges that present themselves to researchers from time to time.

The study of terminology may be considered from two perspectives:

Origin:

A term is marked by a set of characteristics and features that must be taken seriously. In establishing or formulating a term, two qualities are needed: simplicity, smoothness of use, precision, and clarity of meaning. The closer the secondary meanings of a term remain to its primary linguistic sense, the more readily the mind comprehends it and grasps its significance. In such cases, the reader or researcher finds it easier to perceive the intended concept through recourse to the linguistic meaning. Conversely, whenever a term's meaning diverges too far from its linguistic origin, its understanding becomes clouded with ambiguity and subject to confusion.

Thus, in the coinage of new terminology, the original linguistic sense remains proximate, shifting only slightly through processes such as addition, qualification, or figurative usage. For example, the term *uṣūl* (principles) retains its original form but changes with the addition of specification, as in *uṣūl al-naḥw* (principles of grammar) or *uṣūl al-fiqh* (principles of jurisprudence).

Situation:

Concepts must be formulated for a term in such a way as to be comprehensive and exclusive, avoiding confusion with other terms. A term should be distinguished from others that share its form but differ in meaning. The more a term's specific concept does not overlap with those of other disciplines, the better; this independence and uniqueness make the science clearly delineated and its principles evident. Borrowing terms should only occur when no alternatives remain. Terms confined to a single science more precisely express their intended meanings, whereas frequent use across multiple disciplines leads to conceptual instability, broad semantic scope, and potential overlap with one another. Such overlapping necessitates decisive measures to separate them, aligning each term with its particular field, which is achieved through specification and qualification.

This article reviews a set of rhetorical terms in which naming and, occasionally, conceptual differences have arisen between Arabic and French linguistic traditions. It considers Mokhtar Nouiouat's position on these terms, how he addressed them by finding Arabic equivalents, and the examples he provided to arrive at Arabic terminology or approximate equivalences between Western and French concepts, including new concepts he developed following comparative analysis of Arabic and French examples.

1. Allegorical Metaphor (Al-Majāz al-Mursal):

[5] Ibid., 21–22.

Allegory stands in opposition to literal truth; the latter is the foundation, and allegory its derivative. Allegory involves transforming a truth into a metaphor by a contextual indication that prevents the expression of the truth itself. Arabic scholars unanimously agree that allegory can be divided into two types: allegorical metaphor and simile. An allegorical metaphor is every metaphor that is not bound by a relation of similarity.

Specifically, a simple allegorical metaphor is a word deliberately used in a sense other than its original meaning, with an indication that the literal meaning is not intended.[6] This distinguishes it from metaphor and similarity. The intention behind using the term in a nonliteral sense by the speaker forms the basis of differentiation between truth and allegory; without this, truth and allegory would be indistinguishable.

"Allegory consists of not using the word according to its original meaning for which it was coined, but rather in surpassing that original meaning to another meaning that suits it. This suitability between the original meaning and the allegorical meaning legitimises the use of the allegorical meaning of the word. This correlation between the two meanings is called the relationship, which may be similar."[7]

Mokhtar Nouiouat referred to allegorical metaphor as "relation metaphors" (majāz al-ʿalāqa), a term commonly used by some scholars of tafsīr and jurisprudence. However, classical Arabic rhetoricians do not employ this designation; instead, they name it *al-majāz al-mursal* (allegorical metaphor). This figure of speech is founded upon relationships other than similarity, which is specific to simile and metaphor and different from the relation of necessity that characterises *kināya* (metonymy). Among the classical scholars who mentioned this term are, for example, but not limited to the following:

- Abū al-ʿAbbās Shihāb al-Dīn Aḥmad ibn Idrīs ibn ʿAbd al-Raḥmān al-Mālikī, known as al-Qurāfī (d. 684 AH), author of *Al-Furūq (Anwār al-Burūq fī Anwāʾ al-Furūq)*.

- Abū al-ʿAbbās Shihāb al-Dīn Aḥmad ibn Yūsuf ibn ʿAbd al-Dāʾim, known as al-Samīn al-Ḥalabī (d. 756 AH), author of *ʿUmdat al-Ḥuffāẓ fī Tafsīr Ashraf al-Alfāẓ*.

- Abū Ḥafṣ Sirāj al-Dīn ʿUmar ibn ʿAlī ibn ʿĀdil al-Ḥanbalī al-Dimashqī al-Numānī (d. 775 AH), author of *Al-Libāb fī ʿUlūm al-Kitāb*.

- Abū ʿAbdullāh Badr al-Dīn Muḥammad ibn ʿAbdullāh ibn Bahādir al-Zarkashī (d. 794 AH), author of *Al-Baḥr al-Muḥīṭ fī Uṣūl al-Fiqh*.

Following this, we contend that the concept shared between the two terms (*al-majāz al-mursal* and *majāz al-ʿalāqa*) is identical, although the term *al-majāz al-mursal* is more precise and accurate. This is because it distinguishes itself from allegories found in metaphor, simile, and metonymy, which are governed by relationships of similarity. Conversely, the term "relation metaphor" is broader and inclusive of all cases. If one wants to distinguish metaphor and simile, one says that the metaphor's relation is similar, whereas the "relation metaphor" remains unrestricted until differentiation is made. If the relationship is other than similarity, it is termed *al-majāz al-mursal*. It is called "mursal" (sent without restriction) because it is not confined to a single relationship, as a metaphor is, but encompasses several kinds of relationships.[8]

The widespread use of the term *al-majāz al-mursal* (allegorical metaphor) instead of *majāz al-ʿalāqa* (relation metaphor) confirms the precision of the former, even though it is fundamentally based on the relationship between two

[6] Aḥmad ibn Ibrāhīm ibn Muṣṭafā al-Hāshimī, *Jawāhir al-Balāgha fī al-Maʿānī wa al-Bayān wa al-Badīʿ*, ed. Yūsuf al-Ṣumaylī (Beirut: al-Maktaba al-ʿAsriyya), 252.
[7] Muḥammad ʿAlī Sulṭānī, *Al-Mukhtār min ʿUlūm al-Balāgha wa al-ʿArūḍ* (Damascus: Dār al-ʿIsmāʾ, 2008), 98.
[8] Ibid., 117.

entities. Mokhtar Nouiouat defines *al-majāz al-mursal* or relation-based metaphor as follows: "Relation metaphor lies in naming a thing by a name other than the one assigned to it; that is, giving something the name of another with which it shares a relationship."[9]

The concept of relationship is broader, encompassing similarity and other ties, thus including metaphor, simile, and *al-majāz al-mursal* alike, as all depend on a relationship between two parties (the literal and the figurative). The relationships identified by Nouiouat do not depart from those outlined by classical scholars, and we present here the relationships that the early Arab rhetoricians established for *al-majāz al-mursal*, along with their examples.

The partial relationship is exemplified in the saying of Allah the Exalted: "[And every person, We have fastened to him his fate upon his neck, and We will produce for him on the Day of Resurrection a record which he will find spread open.]" (Al-Isrāʾ 17:13). Originally, the neck was designated for the necklace, collar, or fetter. The Qurʾānic usages are precise; where submission, humility, abasement, meekness, and obedience are intended, the word *ʿunuq* (neck) is used.

Conversely, *jīd* (nape/throat) is employed when referring to beauty, grace, and adornment, following the Arabs' customary use. Allah says: "[In her neck is a twisted rope of palm fibre.]" (Al-Masad 111:5). Here, *jīd* refers to the neck of a woman but is used in a context distinct from submission or obedience.

The Arabs employ this distinction in their speech; the poet ʿAntara ibn Shaddād al-ʿAbsī (from *Al-Kāmil*) says:

The stage of the Arameans in the valley of the sanctuary,

Is there within you one who grieves, departs and returns?

On the right side of the world lies a lesson of landmarks,

By which my skin weakened and my endurance vanished.

From every enchanting beauty whose neck turns,

Playful as the gambolling of a graceful young gazelle.

Here, metaphor is used because life and death are connected with it. When death is intended, the phrase "his neck was cut" is employed, and when free life is meant, the phrase "liberation of the neck" is used. When captives are humiliated, they are bound by the neck. Allah says, "[When the shackles are placed upon their necks and the chains; they are dragged.]" (Ghafir 40:71).

Al-Ḥarīrī, in *Al-Maqāma al-Bakrīya*, when speaking about a woman, states, "Although she is the tender one who soothes, the ambitious who destroys, she is the binding fetter of lice and a wound that never heals!"[10] This is a metaphor by contextual indication, as the captive's suffering is increased by captivity, as he is bound and wears ragged clothing infested with lice, thus amplifying his hardship.

The poet says:

"And if she swore, her oath would never be broken

[9] Mokhtar Nouiouat, *Arabic Rhetoric in Light of Contemporary Rhetorical Approaches between French and Arabic Traditions* (Algiers: Dar Houma Publishing, 2013), 27.
[10] Abū Muḥammad al-Qāsim ibn ʿAlī al-Ḥarīrī, *Al-Maqāmāt al-Adabiyya* (Beirut: Maṭbaʿat al-Maʿārif, 1873), 462.

The 'darkened fingertips' have no oath."

“Darkened fingertips” is a metaphor based on a part-whole relation, referring to the palm. The fingertips are parts of the hand, so the whole is expressed by naming a part due to this partial relationship.

- Its total relationship, which is the opposite of the partial one, as in Allah’s saying: “[They put their fingers in their ears.]” (Nūḥ 71:7), where *fingers* refer to the fingertips.

- Its circumstantial relationship: “[And He it is Who made the night a covering for you, and sleep a rest, and made the day to rise up again.]” (Al-Furqān 25:47). Here, the time is named by what occurs within it by virtue of a circumstantial relation, since human actions take place in its time.

- Its local relationship: It mentions the place but implicitly refers to the circumstance. For example, the poet says:

- "Indeed, although the enemy's covenant be aged,

- Hatred remains hidden within the breasts."

- Here, *in the breasts* is the place, but the intended meaning is *in the heart*, because the heart’s seat is the breast. Allah says, “[Have they not travelled through the land so that they might have hearts with which to understand or ears with which to hear? Indeed, it is not the eyes that are blinded but rather the hearts that are within the breasts.]” (Al-Ḥajj 22:46) and “[And what is concealed within the breasts has been made evident.]” (Al-ʿĀdiyāt 100:10).

- Its current relationship.

- It is an instrumental relationship.

- Relationship of what is to be.

- Relationship of what was.

The terminology coined by Mokhtar Nouiouat differs little from that of classical Arab rhetoricians. It is as follows: causal metaphor; instrumental metaphor; effected metaphor; circumstantial metaphor; local metaphor; characteristic or emblematic metaphor; sensory metaphor; metaphor of the master, guardian, or owner; and metaphor of the thing.

Metaphors of Number (Synecdoche of Number):

Mokhtar Nouiouat defines it as follows: “It is the expression of the plural by the singular or the singular by the plural. For the former, one might say *al-insān* (the human), *al-ghaniyy* (the rich), *al-faqīr* (the poor), *al-ʿArabī* (the Arab), *al-ʿAjamī* (the non-Arab), *al-fāḍil* (the virtuous), *al-ṣāliḥ* (the righteous) among the servants, *al-ʿālim* (the learned), and *al-jāhil* (the ignorant), intending all those to whom any of these names or attributes apply. For the latter, one might say *les Descartes*, *les Spinozas*, *les Louis XIV*, *les Louis XVI*... while only intending those who bear one of these names.”[11]

[11] Mokhtar Nouiouat, *Arabic Rhetoric in Light of Contemporary Rhetorical Approaches between French and Arabic Traditions*, 37–38.

This type of metaphor exists in Arabic and occurs frequently in the Noble Qurʾān. Ibn Fāris devoted a chapter entitled "The chapter on the singular meant to indicate the plural," stating that "One of the Arabs' habits is to mention the singular intending the whole."[12]

Among its evidence is Allah's saying: "[He said, 'These are my guests, so do not disgrace me.']" (Al-Ḥijr 15:68), and His saying: "[If you both repent to Allah, then your hearts have indeed inclined. However, if you support each other against him, then indeed, Allah is his protector, and Gabriel and the righteous believers and the angels thereafter are supporters." (Al-Tahrīm 66:4), and His saying: "[For indeed, they are an enemy to me, except the Lord of the worlds.]" (Ash-Shuʿarāʾ 26:77), and His saying: "[Throw every obstinate disbeliever into Hell.]" (Qāf 50:24).

A subtlety of this usage is that the singular and plural may appear in the same expression, so one should not presume that only the singular, dual, or plural is intended but rather all of these. This usage is limited to specific expressions and cannot be generalised. For example, it is correct to say *hāʾulāʾ umma* (these are a nation), *hādhā umma* (this is a nation), and *humā umma* (these two are a nation) but not *hādhā rajul* (this is a man) or *hāʾulāʾ rajul* (these are men) or *humā rajul* (these two are men). Ibn Fāris says, "Ranks in numbers are three: the rank of the singular, the rank of the dual, and the rank of the plural. These correspond to unity, duality, and plurality; they do not conflict in reality. To refer to a singular by a plural term or a dual by a plural term is metaphor."[13]

Mokhtar Nouiouat holds that this type corresponds in Arabic to the use of the singular for the plural or dual when the relationship between them is one necessity. He illustrates this with the following verse: "[They swear by Allah for your sake to please you, but Allah and His Messenger deserve to be pleased if they are believers.]" (At-Tawba 9:62). Obedience to the Messenger (peace upon him) is regarded as obedience to Allah. In many verses, obedience to Allah is linked with obedience to His Messenger. The pronoun in *li-yarḍū-hu* (to please Him) refers to the nearer antecedent, which is the Messenger (peace upon him). On the other hand, the oath sworn by the disbelievers by Allah is directed at the believers and the Messenger. Allah is fully aware of what is in the breasts of disbelievers and is independent of them and their oath.

Metaphor of Material (Synecdoche of Matter):

A distinct feature of Arabic, although rare in other languages, is that the name of an object often indicates a quality or an action that becomes its characteristic due to prevalence, as seen in terms of *al-Fattāḥ* (the Opener) and *al-Tawwāb* (the Accepter of Repentance). Nicknames and epithets, such as *Abū Ṭurāb* (Father of Dust), a kunyah of ʿAlī ibn Abī Ṭālib (may God be pleased with him), are closely related to this category. However, this particular kunyah has a specific original story, and it is important to distinguish between a person called *Abū Ṭurāb* simply as one created from dust and someone called *Abū Ṭurāb* as ʿAlī was when the Prophet (peace be upon him) found him sleeping in the mosque. As Sahl ibn Saʿd narrated, the Prophet entered upon Fāṭima and asked, "Where is your cousin?" She said, "There was some conversation between us, and he has gone out." The Prophet then went out and found him sleeping in the shade of the mosque wall with his garment fallen. The Prophet shook the dust from his body and said to him, "O Abū Ṭurāb, rise! O Abū Ṭurāb, rise!" Sahl said, "There was no name more beloved to ʿAlī than to be called by it."[14]

[12] Aḥmad ibn Fāris ibn Zakariyyāʾ al-Qazwīnī al-Rāzī al-Ṣāḥibī, *Fiqh al-Lugha al-ʿArabiyya wa Masāʾiluhā wa Sunan al-ʿArab fī Kalāmahā*, ed. ʿUmar Fārūq al-Ṭibāʿ (Beirut: Maktabat al-Maʿārif, 1993), 216.

[13] Ibid., 195.

[14] Abū Bishr Muḥammad ibn Aḥmad ibn Ḥammād ibn Saʿīd ibn Muslim al-Anṣārī al-Dawlabi al-Rāzī, *Al-Kunā wa al-Asmāʾ*, ed. Abū Qutayba Naẓar Muḥammad al-Fāryābī (Beirut: Dār Ibn Ḥazm, 2000), vol. 1, 21.

This example does not fall into the category of metaphor described by Mokhtar Nouiouat by drawing an analogy with what exists in French.

Mokhtar Nouiouat defines this type of metaphor as "the metaphor in which one expresses the thing by its material."[15] That is, by the material from which it is made. He exemplifies it in French and Arabic by *al-silāḥ* (fer, iron) for weapon and *al-riša* (feather) for pen, and so forth.

He added, "Some modern researchers consider this type of metaphor closer to *catachresis* (arbitrary or improper usage) than to art requiring refined taste."[16]

Indeed, such a metaphor can lead to ambiguity. For example, if one says, "So-and-So pointed with an iron," it may be understood that he carried a sword, a dagger, or a knife. Alternatively, it might be understood as indicating a rod of iron or something similar to iron. If everything made of iron were simply called "iron," this would be inappropriate, just as in human names: each individual has a specific name (Zayd, ʿAmr, Khālid...), and each is rightly called a human. It is not appropriate to call all previously mentioned individuals merely "human," as this would cause confusion and restrict clarity for the user. This is because such a term is either an attribute or a generic collective or singular name; for instance, "angels" is the plural of "angel" and a singular generic noun, yet each angel has an individual name such as Jibrīl, Mikāʾīl, and ʿAzrāʾīl. These names refer to specific entities.

These classifications differ from those established by classical Arab rhetoricians. It is evident from Mokhtar Nouiouat's book that the French language and its rhetoric influence him. On this basis, Nouiouat introduced many rhetorical terms into Arabic rhetoric through translation. Many of the rhetorical terms he used differ from the classical Arabic rhetorical terminology.

We present some of these terms and compare their Arabic and French equivalents to highlight the differences between them:

- The metaphor of the thing
- Metaphors of the master, guardian, and owner
- Sensory metaphor
- Metaphors of a characteristic or emblem
- Historical allusion
- Mythical allusion
- Sufficiency – abrupt cessation

Additionally, Nouiouat designates another category of metaphor as *majāzāt al-ishtimāl* (Synecdoches), a term he borrows from Greek. He defines it as follows: "Synecdoches consist in naming something by the name of another with which it forms a group or a whole, whether tangible or intangible, such that the existence of the first is inherently or conceptually bound to the existence of the second. On this basis, a word or phrase indicates a broader or narrower meaning than its original meaning does, generally indicating broader meaning when narrower meaning is used and

[15] Mokhtar Nouiouat, *Arabic Rhetoric in Light of Contemporary Rhetorical Approaches between French and Arabic Traditions* (Algiers: Dar Houma Publishing, 2013), 37.
[16] Ibid., 37.

narrower meaning when broader meaning is used. Synecdoche can thus be defined as the use of the more for the less and the less for the more."[17]

From this definition, it can be inferred that it largely aligns with the definitions set by classical Arabic rhetoricians. For example, the metaphor based on an instrumental relationship corresponds to what Nouiouat calls the metaphor of material (*synecdoque de la matière*). According to him, the metaphor of material "is the metaphor in which one expresses the thing by its material,"[18] referring to the material from which it is made. Nouiouat provides the following examples:

Arabic	French
weapon	fer (iron)
horn	airain (bronze)
jewellery	or (gold)
skin	Taureau (bull)
fabric	castor (beaver)

In these examples and others, this type often involves using the whole for the part. For example, when he exemplifies *al-rīsha* (feather) for the pen and *al-ʿūd* (wood) for the instrument, he illustrates either the part representing the whole or the whole representing the part. The pen is made from feathers and reeds, materials from which it is constructed, just as instruments are named after the materials or parts that compose them.

This is also evident in the Qurʾānic verse: "[The month of Ramadān] is that in which was revealed the Qurʾān, a guidance for the people and clear proofs of guidance and criterion. So whoever sights [the new moon of] the month, let him fast it..." (Al-Baqarah 2:185). This is metaphorical; the original meaning is "whoever sights the crescent moon." The crescent is the instrument for the month, and the verse expresses the instrument by what it produces and signals. The one who sights is the crescent moon, which signifies the arrival and departure of the month; thus, the instrument stands for its indication.

Notably, the French examples cited by Nouiouat differ from the examples employed by classical Arab rhetoricians. The cause of this difference lies in usage: in Arabic, it is correct to say that "I held the pen" and "I held the pen's feather" are not metaphorical because Arabs traditionally wrote with a feather considered the pen itself since the pen was taken from the feather. To consider it metaphorical, there must be agreement between speaker and addressee for the expression to be accepted as correct.

Returning to the concept of expressing the less by the more and vice versa, in Arabic, one says, "I drank seawater," although one does not literally mean all of it, but only some part. The contextual and rational indication prevents the statement from being taken literally, as it is not logically acceptable for a person to drink the entire seawater; instead, they drink a part of it. The use of plural forms to denote an unspecified large part is a case of *majāz mursal* (metaphor by circumstantial indication).

2. Augmentation (Al-Ziyāda):

Initially, this is a morphological term related to word structure. Words in Arabic are generally triliteral in terms of their root letters. By adding certain letters, those considered augmentative, as seen in *saʾaltumūnihā* or *hawāyat al-simān*, one obtains quadriliteral, quinqueliteral, or hexaliteral forms. These additions to the root letters carry semantic significance, adding layers of meaning to the word and thus to the sentence. Hence, augmentation in morphology generates meaning.

At the sentence level, additions to the sentence structure lead to an increase in meaning. Arab linguists and rhetoricians generate meaning through various devices, including the following:

- Restriction (taqsīr)
- Specification of the predicate and subject
- Equivalence
- Elaboration (iṭnāb)
- Redundancy (ḥashw)
- Repetition
- Emphasis

Rhetoricians employ their own methods to generate, multiply, and develop meanings. Amplification refers to variations in meanings caused by factors such as word order, the addition of one or more words, or augmentation at the level of letters or sentence structure. The goal of all of this is to achieve an increase in meaning, intensity, clarity, or rhetorical impact.

1. Particles of Meaning (ḥurūf al-maʿānī):

Particles of meaning are those letters that carry meaning when combined with others, in contrast to the letters of the alphabet (ḥurūf al-hijāʾ), which bear no inherent meaning. They are the components that constitute a word. For example, in the word *ḥaṣala* (he obtained), the letters of the alphabet are ḥāʾ, ṣād, and lām.

Examples of particles of meaning include interrogative particles and their various forms. For instance, the hamzah in Allah's saying: "[Their messengers said, 'Is there doubt about Allah, Creator of the heavens and the earth? He invites you to forgive you of your sins and delay you to a specified term.' They said, 'You are only human like us, and you want to turn us away from that which our fathers worshiped, so bring us a clear authority.']" (Ibrāhīm 14:10). The interrogative particle here adds the meanings of rebuke, negation, and denunciation.

Al-Fakhr al-Rāzī commented, "The first question His saying 'Is there doubt about Allah?' is an interrogative in the form of denial. After mentioning this meaning, he followed it with a sign indicating the existence of the creator, the chosen one. This is His saying: 'Creator of the heavens and the earth.' We have previously mentioned in this book how the existence of the heavens and the earth indicates the need for a chosen, wise creator repeatedly and fully, so we do not repeat it here."[19]

[19] Fakhr al-Dīn al-Rāzī, *Mafātīḥ al-Ghayb or Al-Tafsīr al-Kabīr*, 3rd ed. (Beirut: Dār Iḥyāʾ al-Turāth al-ʿArabī, 1420 AH), vol. 19, 70.

Had the interrogative hamzah not entered this verse, these meanings would not have been understood in this manner. Such meanings can be discerned in other ways through differences in syntactic arrangement, such as through advancement and delay, addition and omission of words, etc.

Al-Ṣāḥibī, in his work *Fiqh al-Lugha* and *Sunan al-ʿArab*, includes a chapter entitled "The Chapter on Additions to Nouns," in which he states: "Among the customs of the Arabs is the addition of letters to nouns, which may be for exaggeration or for distortion and disparagement. I heard a trustworthy person say that the Arabs do this for distortion. They say for something far away, excessively distant, between the two extremes, *ṭirimāḥ*; its original form is *ṭarḥ*, which means distant. However, when it became excessively long, it was called *ṭirimāḥ*, whereby the name was distorted as the image was distorted. This is not a baseless statement."[20]

These additions differ from morphological augmentations in Arabic, although they are studied within that field. They pertain in *Fiqh al-Lugha* to meaning. Morphological additions address word structure and the impact of changing patterns on meaning and meaning generation, which is a particular feature of Arabic and is not subject to analogy but rather preserved distinctly. Examples include:

Original	Meaning	Distorted Form	Explanation
al-Ṭarḥ (الطرح)	distant	Ṭirmāḥ (طرماح)	The distant between two extremes, excessively long
al-Raʿsh (الرعش)	tremor	Raʿshan (رعشن)	The one who trembles
Khalb (خلب)		Khalbān (خلبن)	Strong claws
Zarq (زرق)		Zarqam (زرقم)	Deep blue
Ṣalad (صلد)		Ṣaladum (صلدم)	A strong she-camel
Shadaq (شدق)		Shadaqam (شدقم)	Wide jaw
al-Tasammuʿ (التَّسَمُّع)		Simʿanna (سِمْعَنَّة)	Al-Ṣāḥib ibn ʿAbbād said: "A woman who listens to all who speak and watches them"[21]
(Much listening)			
al-Tanẓur (التَّنَظُّر)		Naẓranna - Nuẓranna (نِظْرَنَّة - نُظْرُنَّة)	Much looking and insight

2. Word Addition (Ziyādat al-Kalimāt):

Grammarians state that a sentence consists of a predicate and a subject (al-mubtada' and al-khabar, or a verb with its doer). Anything beyond this is considered *faḍalāt* (excess), that is, surplus words that can usually be omitted. These additions exceed the essentials to add detailed or additional meanings that clarify the sentence from specific

[20] Aḥmad ibn Fāris ibn Zakariyyāʾ al-Qazwīnī al-Rāzī al-Ṣāḥibī, *Fiqh al-Lugha al-ʿArabiyya wa Masāʾiluhā wa Sunan al-ʿArab fī Kalāmahā*, ed. Muḥammad ʿAlī Bayḍūn (Beirut: Muʾassasat al-Risāla, 1997), 62.
[21] Ismāʿīl ibn ʿAbbād al-Ṣāḥib, *Al-Muḥīṭ fī al-Lugha, Kāfī al-Kifāʾa*, ed. Muḥammad Ḥasan Āl Yāsīn (Beirut: ʿĀlam al-Kutub, 1994), vol. 1, 378.

perspectives related to the action, such as direction, beginning, and ending, or related to the noun, such as adjectives, annexations, circumstantial qualifiers, specifications, and so forth. Modern linguists call these additions *mukammilāt* or supplements, as they increase meanings according to necessity. These *faḍalāt* can be categorised as follows:

- Semiphrases (prepositional phrases and adverbs of time and place)
- Circumstantial clauses (al-ḥāl)
- Specification (al-tamyīz)
- Object complements of types *bi* (with), *lahu* (for him), absolute object (*muṭlaq*), accompanying phrases (*maʿahu*)
- Emphasis (both verbal and semantic)

These *faḍalāt* add new meanings to the sentence. Rhetoricians have devoted a chapter in their works entitled "States of the Subject and Predicate," addressing various aspects, such as omission and mention, definiteness and indefiniteness, advancement and delay.[22]

Mokhtar Nouiouat prefers the term *istizāda* (استزادة, meaning "augmentation" or "increase") instead of *ziyāda* (الزيادة) to distinguish it clearly from the morphological concept of *ḥurūf al-ziyāda* (letters of augmentation) in Arabic grammar. This distinction is helpful because it prevents confusion between the terminologies used in different linguistic sciences.

3. Using one Form as a Substitute for another:

Scholars of Arabic linguistics have observed that this type of usage is widely practiced in Arabic, particularly in Arabic poetry, speeches, and similar genres. The Qurʾān, revealed in pure Arabic, follows the linguistic patterns spoken by Arabs but enhances their beauty, precision, and eloquence. Ibn Fāris, in his work *Al-Ṣāḥibī fī Fiqh al-Lugha al-ʿArabiyya wa Masāʾiluhā wa Sunan al-ʿArab fī Kalāmahā*, addresses this type extensively under various topics, such as the following:

- Names given to individuals on the basis of proximity or cause.
- Terms function as names, although they are actually epithets or titles.

Moreover, other matters that require lengthy discussion. This form of substitution contributes richly to the nuances and flexibility of Arabic expression.

An example from the Qurʾān is the verse: "[He said, 'I will take refuge on a mountain that will protect me from the water.' He said, 'No protector today from the decree of Allah except for one whom He has mercy on.' The wave came between them, and he was among the drowned.]" (Hūd 11:43).

[22] Muḥammad ibn ʿAbd al-Raḥmān ibn ʿUmar, *Al-Iḍāḥ fī ʿUlūm al-Balāgha*, ed. Muḥammad ʿAbd al-Munʿim Khafājī (Beirut: Al-Sharikah al-ʿĀlamiyyah lil-Kitāb, 1989), vol. 1, 109.

The word *ʿāṣim* (protector) here means *al-maʿṣūm* (the protected). The active participle (ism al-fāʿil) is used where one would expect the passive participle (ism al-mafʿūl). This is similar to the phrase: "[He will be in a pleasant life.]" (Al-Qāriʿa 101:7), where *rāḍiya* (pleased) is used in the sense of *marḍiyya* (pleasing). Life itself does not experience pleasure; rather, it is the person who enjoys it.

In the verse, *ʿāṣim* appears to mean "preventer" or "protector", and *yasṭim* means "he prevents" from drowning. The context shows that protection from drowning is only for those on whom Allah has mercy. Allah is the authentic protector (*al-ʿāṣim*), whereas Prophet Nūḥ's people and his son are the intended drowned because of their lack of faith. The original phrasing might have been "no one is protected from Allah's decree except whom He has mercy on." However, since Nūḥ's son was doomed to drown, the active participle is used, referring to the mountain and similar objects expected to protect but unable to do so. The negation *lā* is employed to indicate that protection is by Allah's will; He has mercy on whom He wills and punishes whom He wills.

"It is also permissible that 'lā dhī ʿiṣmah' means protected, and 'illā man raḥim' is an appositive clarifying who is protected."[23] Moreover, Allah knows best.

Conclusion:

The comparative approach yields significant research results by comparing languages on many levels. The level of linguistic styles particularly generates meanings and connotations and, in our view, is broader than others because of the wealth of styles within a single language. Arabic is among the richest languages in stylistic diversity because it relies on various and abundant rules for generating meanings and implications.

The key findings from this research paper are summarised as follows:

1. The comparative method revealed distinctions and divergences between Arabic and French in the use of metaphor both as a term and as a concept.

2. Languages do not necessarily share the same stylistic methods; as long as grammatical rules differ, the styles inevitably vary. Therefore, no language can be wholly subjected to the rules of another.

3. Each science has its specific terminology rooted in its native language and uniquely distinguished from translated terms, as translation may result in loss of the term's original specificity derived from its mother tongue. For this reason, Mokhtar Nouiouat attempts to bridge the conceptual differences between terms in the two languages.

4. The concept of metaphor differs between Arabic and French owing to differences in expressive modes and vocabulary. Since the words themselves differ, the rhetorical terms indicating artistic forms also differ, being grounded in usage shaped primarily by refined taste, especially in Arabic.

5. Rhetorical terminology generally varies from language to language, and languages may borrow terms from each other, adapting them according to their linguistic properties and rules at the phonetic, morphological, and other levels.

Abstract

The rise of digital communication and multimodal discourse has transformed traditional understandings of literacy and pedagogy, demanding innovative frameworks for education. This study explores the socio-semiotic approach as a methodological and theoretical foundation for the development of multiliteracy in contemporary teaching practice. Multiliteracy, understood as the capacity to interpret, evaluate, and create meaning across multiple semiotic modes—including text, image, gesture, sound, and digital interaction—requires both critical engagement and reflexive awareness in cross-cultural contexts. The article situates multiliteracy within the broader pedagogy of the digital age, emphasizing its role in fostering learners' capacity to navigate complex semiotic landscapes. Special attention is given to multimodal analysis and visual transcription as practical tools for classroom application. These methods enable educators and students to move beyond intuitive interpretations of communicative choices toward empirically grounded insights into meaning-making processes. By drawing on socio-semiotic theory, the study illustrates how semiotic resources such as images, layouts, and soundtracks function in concert to achieve communicative goals. Findings from classroom-based experimentation demonstrate that students engaging with multimodal analysis develop enhanced critical thinking, improved cross-cultural communication skills, and greater autonomy in digital interaction. The socio-semiotic approach, therefore, offers not only a theoretical lens but also a pragmatic strategy for transforming educational practice in response to the challenges and opportunities of the 21st century. The paper argues that integrating socio-semiotic tools into teaching fosters an inclusive, reflective, and globally relevant pedagogy that empowers learners to participate effectively in increasingly multimodal societies.

Introduction

In the 21st century, interactive digital media technologies increasingly influence all spheres of life, making the ability to critically analyze and interpret online news, websites, videos, and social media posts an essential skill of the present century.

In response to the challenges of the digital age, which has given rise to new media where language combines in complex and dynamic ways with images and sound resources, both domestic and international researchers in pedagogy and linguistics (T.G. Galaktionova, O.A. Kazakova, C. Jewitt, G. Kress, Bourne J., Franks A., Hardcastle J., Jones K., Euan R.L. Unsworth L., et al.) have developed theoretical and practical foundations for integrating multiliteracy into the educational process (Kazkova, 2024; Jewitt, 2017; Kress et al., 2005; Unsworth, 2021).

This article presents a socio-semiotic approach to multiliteracy education. The purpose of this work is to theoretically justify and describe the practical application of the socio-semiotic approach in developing multiliteracy through multimodal analysis and the method of visual transcription to foster critical thinking in digital learning environments. The theoretical basis for multimodal analysis is the socio-semiotic theory of analyzing multimodal texts, emphasizing teaching and learning metalanguage for decoding multimodal meanings. The described approach contributes to the development of analytical and critical thinking skills, enabling students to be responsible and active participants in the acquisition and dissemination of knowledge and information in contemporary society.

Literacy in the Digital Age

The changing conditions of digital technology use in the 21st century have given rise to the problem of developing new literacy skills across various research domains. According to Kress (2003), in the new millennium, "it is no longer possible to think of literacy in isolation from a wide range of social, technological, and economic factors" (p. 3).

Traditionally, literacy was linguistically limited, understood as mastery of language in a strictly linguistic sense. However, literacy cannot be considered solely as a linguistic phenomenon due to the pervasive digitization of society. The diversity of semiotic systems and the broad potential of heterogeneous semiotic resources to convey and receive educational information have led to the expansion and refinement of the concept of literacy.

In 1996, the New London Group developed the pedagogy of multiliteracies, extending beyond traditional literacy to include multiple discourses (The New London Group, 1996). Researchers (Anstey & Bull, 2005; Kress, 2003; Unsworth, 2001) aimed to integrate semiotically diverse modes of meaning-making, where texts are combined with visual, auditory, and behavioral forms of information delivery. According to multiliteracy pedagogy, the educational process comprises four interconnected components: modeling real-life situations to develop skills for interpreting and analyzing socio-cultural contexts; teaching metalanguage necessary for understanding meaning-making processes; conducting critical analysis to develop skills for interpreting social contexts and identifying the purpose of meaning creation; and applying these skills in practice by producing multimodal texts (The New London Group, 1996).

By 2001, multiliteracy pedagogy evolved with the inclusion of critical literacy, which became a central principle of this approach. The introduction of this concept is associated with L. Unsworth, who expanded multiliteracy to include abilities such as decoding text meaning, participating in text comprehension and production, functional use, and ultimately critical analysis. The textual analyst observes, analyzes visual and verbal information, and determines how the choice of linguistic and visual resources influences opinion expression and how alternative verbal and visual resources create differing perspectives (Unsworth, 2001).

Bull and Anstey (2005) complemented Unsworth's theoretical positions and presented decoding as the process of tracking the functioning of homogeneous and heterogeneous semiotic systems in a text. Another key idea is that using a text implies understanding that the structure of a text may vary across contexts and platforms, despite having the same communicative purpose.

The goal of multiliteracy pedagogy is to provide learners with experience in cognitive activity and to develop a range of skills, including critical thinking, reflection, participation in discussion, evaluating information reliability, understanding the author's intent, identifying communicative strategies, and effectively communicating using diverse digital tools (Anstey & Bull, 2005).

Further research by the Delphi Committee of the American Philosophical Association supplemented these skills with logical reasoning, evaluation, explanation, and self-regulation (The Delphi Report, 2025). Considering the above, Kellner (2021) argues that literacy in the digital era requires not only technical knowledge but also automated skills in reading, writing, communication, and the ability to critically analyze, interpret, and create print, graphic, audio, and multimedia materials.

Thus, in the context of digital society, traditional literacy, defined simply as the ability to read and write, is insufficient. Its meaning has expanded to include the ability to interpret and create meaning using a combination of semiotic resources—verbal, auditory, visual, graphic, and digital. Multiliteracy pedagogy opens new perspectives for forming this modern literacy, emphasizing critical thinking, reflection, multimodal text analysis, assessment of information reliability, and effective interaction in digital spaces. One of the tools facilitating this development is the socio-semiotic approach.

Multimodal Analysis as a Tool for Developing Multiliteracy in the Socio-Semiotic Approach

The socio-semiotic approach is interdisciplinary, encompassing anthropology, sociology, critical and pragmatic discourse theory, visual design concepts (Halliday, 1978; Kress & van Leeuwen, 2021; O'Tool, 1994), and other fields. The development of the socio-semiotic approach is described by Dutova (2024).

Within this approach, discourse is the interaction of multiple semiotic resources (language, images, music, etc.) used to create meanings and interpret social practices. An important aspect of meaning-making is the process of combining interconnected semiotic resources. The choice of semiotic resources is not merely conscious but represents a set of possible alternatives (Kress, 2003). The approach is based on the principle of metafunctionality, implemented through the combined functioning of semiotic resources performing three metafunctions: ideational (interpreting the perception of the world), interpersonal (establishing social relationships and expressing attitudes), and compositional (organizing meanings into coherent messages according to context).

Multimodal analysis, developed by Kress & van Leeuwen, O'Halloran, Norris, and Scollon & Scollon, is a practical tool for studying multimodal relationships in educational settings (Kress & Bezemer, 2023; O'Halloran, 2021; Norris, 2020; Scollon & Wong Scollon, 2003). According to Hobbs (2004), the digital age requires educators to use such technologies to analyze and develop students' critical thinking. Multimodal analysis exposes students to various semiotic choices available to authors when creating multimodal texts, providing tools for systematic study of new media texts and fostering the ability to critically analyze various functional text types and genres from print and digital sources.

The use of multimodal analysis to develop critical thinking and intercultural sensitivity was tested in intercultural communication courses. In the first phase, students learned metalanguage for analysis, including lectures, seminars, and exercises covering linguistic-pragmatic discourse features, communicative strategies, and culturally specific tactics in Russian and Anglo-American traditions. In the second phase, communicative situations were identified, and students analyzed expected behaviors of Russian and English cultural representatives depending on cultural type.

Students then analyzed film fragments illustrating interactions between supervisors and subordinates to study cultural dimensions of power distance using the visual transcription method (Norris, 2020). Visual transcription involves sequential study of homogeneous semiotic resources followed by analysis of heterogeneous resources in combination. Data were recorded in visual transcription protocols with screenshots, timestamps, and coded verbal and nonverbal actions. Students created protocols for nonverbal behavior (proxemics, kinesics, haptics, gaze) and verbal behavior (communicative strategies, tactics, and language tools). Students compared behaviors across cultures, explained motives, and identified cultural values.

This practice allows students to develop an understanding of cultural differences and the ability to critically interpret linguistic, visual, and audio resources, grounding their analysis in empirical evidence rather than intuition. Multimodal analysis demonstrates that verbal resources do not always dominate communication, and camera framing can serve as a strong interactive resource for guiding audience attention. The socio-semiotic approach thus supports empirical discovery of how semiotic choices achieve communicative goals.

Conclusion

The socio-semiotic approach, grounded in Halliday's theory of metafunctionality and Kress & van Leeuwen's multimodal design concepts, provides a solid theoretical foundation for developing critical thinking in education. Testing this approach through multimodal analysis and Norris' visual transcription method enables the transition from intuitive ideas about meaning-making to empirical practice with concrete analytical tools.

Application in intercultural communication courses showed that learning metalanguage and systematically recording verbal and nonverbal semiotic resources allows students to critically evaluate how semiotic choices impact communicative goals. Notably, nonverbal resources often dominate, which would remain undetected without multimodal analysis. This method fosters analytical competence, revealing hidden ideological and cultural meanings in media, forming the basis for critical thinking central to multiliteracy pedagogy.

In the digital era, multiliteracy is not merely a pedagogical innovation but a prerequisite for functioning effectively in an information society. It requires transitioning from theoretical instruction to practices that develop reflection, understanding of author strategies, evaluation of reliability, and creation of multimodal messages.

Future directions include expanding multimodal analysis to other humanities disciplines, developing digital tools such as interactive visual transcription templates, and conducting cross-cultural comparisons of multimodal practices to deepen understanding of cultural meaning-making and intercultural multiliteracy. The socio-semiotic approach thus enhances the educational process, ensuring efficiency, engagement, and meaningful learning in the digital age.

Methodology

The methodological framework of this study is grounded in a socio-semiotic approach, which emphasizes the role of semiotic resources in the construction of meaning across multimodal contexts. The research was conducted as part of teaching practice within the Romano-Germanic Languages Department of Novosibirsk State Pedagogical University, focusing on courses in cross-cultural communication and language pedagogy.

Research Design

The study employed a qualitative, classroom-based design, combining elements of case study and action research. Students participated in structured activities designed to integrate multimodal analysis and visual transcription into their learning processes. This approach allowed for both the observation of real teaching practice and the experimental testing of socio-semiotic strategies.

Participants

The participants included undergraduate students majoring in linguistics and cross-cultural communication. A total of 45 students (aged 18–22) took part in the study over one academic semester. The selection was based on voluntary participation, with informed consent obtained in advance.

Data Collection Methods

1. Classroom Observations: The researcher systematically documented classroom interactions, focusing on students' responses to multimodal analysis tasks.

2. Student Artifacts: Written reflections, visual transcriptions, and analytical notes produced by students were collected and analyzed.

3. Semi-Structured Interviews: A subset of students (n=12) participated in interviews to provide insights into their experiences with multimodal tasks and perceptions of multiliteracy development.

Analytical Tools

The study applied multimodal analysis and visual transcription techniques to examine how students interpreted semiotic resources such as images, gestures, sounds, and textual arrangements. Multimodal analysis enabled the deconstruction of meaning-making processes, while visual transcription provided an empirical representation of the temporal and spatial organization of multimodal texts.

Data Analysis

The collected data were coded thematically, with particular attention paid to patterns in students' critical reflections, interpretative strategies, and demonstrated shifts from intuitive to evidence-based judgments. Triangulation was achieved by comparing classroom observations, student artifacts, and interview data to ensure the reliability and validity of the findings.

Ethical Considerations

Ethical approval was obtained from the faculty committee of Novosibirsk State Pedagogical University. All participants were informed of the study's purpose, and their anonymity and confidentiality were guaranteed. Participation was voluntary, and no academic penalties or incentives influenced involvement.

Findings

Enhanced Critical Literacy: Students developed the ability to critically analyze multimodal texts, identifying how semiotic resources such as images, gestures, and sounds contribute to meaning-making.

Empirical Insight through Visual Transcription: The method of visual transcription allowed learners to shift from subjective interpretations toward evidence-based conclusions, thereby strengthening academic rigor.

Improved Cross-Cultural Competence: The socio-semiotic framework facilitated more effective engagement with diverse communicative practices, enhancing intercultural understanding.

Pedagogical Innovation: The socio-semiotic approach provided teachers with structured tools for integrating multimodal analysis into curricula, supporting the pedagogy of multiliteracy.

Digital Readiness: By situating literacy in digital contexts, the approach prepared students for the challenges of contemporary communication, including the ability to reflect, critique, and participate responsibly in digital environments.

Acknowledgement

The author expresses sincere gratitude to the Romano-Germanic Languages Department of Novosibirsk State Pedagogical University for institutional support and to the students who participated in the experimental classes on multimodal analysis and cross-cultural communication. Their active engagement provided valuable insights into the practical application of the socio-semiotic approach in pedagogical practice.

Conflict of Interest

The author declares no conflict of interest. The research was conducted independently, without any commercial or financial relationships that could be construed as a potential conflict of interest.

Abstract

Artificial intelligence (AI) has emerged as one of the most disruptive technological developments of the 21st century, reshaping multiple professional domains, including law and legal consultancy. Within the legal field, AI-driven tools are increasingly utilized to streamline tasks such as case analysis, document review, legal research, and contract drafting. These tools significantly enhance efficiency, reduce the time required for repetitive processes, and provide consultants with predictive insights based on vast databases of jurisprudence and statutory frameworks. Despite these advantages, the integration of AI into legal consultancy presents fundamental challenges. Central among these is the reliability of algorithmic outputs, which often lack contextual sensitivity, interpretive nuance, and ethical reasoning that characterize human legal judgment. Furthermore, the absence of a comprehensive and binding legislative framework regulating the use of AI in legal practice generates considerable ambiguity in terms of accountability and civil liability for errors, omissions, or biased outcomes produced by AI systems.

This study demonstrates that AI should not be regarded as a replacement for human legal consultants but rather as an auxiliary instrument functioning under their direct supervision. The research highlights that legal consultants remain irreplaceable in providing interpretive reasoning, ensuring the validity of legal arguments, and safeguarding ethical responsibility. Findings suggest that while AI enhances productivity, it also introduces risks of over-reliance, data privacy breaches, and unresolved issues of liability in cases of erroneous or misleading outputs. Accordingly, the paper concludes that the effective use of AI in legal consultancy requires a dual approach: (i) legal reforms to establish a clear regulatory and liability framework governing AI-assisted advice, and (ii) the reinforcement of human oversight to ensure the accuracy, fairness, and ethical legitimacy of AI-driven legal processes. The study underscores that the future of legal consultation lies not in the substitution of human expertise but in the symbiotic interaction between human consultants and intelligent technologies, thereby fostering a more efficient yet accountable legal system.

1. Introduction:

The advent of artificial intelligence has triggered profound transformations across multiple fields, including the legal domain, which was traditionally the preserve of legal professionals such as lawyers, notaries, bailiffs, and university professors specializing in law. These professionals were legally authorized to provide legal consultations. In the present day, however, access to legal information has become attainable through technological advancements, with sophisticated algorithms capable of analyzing legal texts and predicting possible solutions to specific disputes.

This evolution in the use of technology, particularly artificial intelligence tools, prompts several pressing questions: Can artificial intelligence genuinely deliver legal information with precision, transparency, and impartiality? Does it truly enhance the effectiveness of legal professionals? In light of these considerations, the following research problem emerges:

Do artificial intelligence tools threaten the role of legal consultants, or do they serve as complementary instruments supporting their profession?

Moreover, under what circumstances do legal consultants remain accountable for errors that result from the use of artificial intelligence in providing legal consultation?

Research Hypotheses:

Examining legal consultation in the era of artificial intelligence requires the formulation of a set of hypotheses to illuminate this technological transformation:

- **Hypothesis 1:** Artificial intelligence facilitates the work of legal consultants and legal professionals in general, and contributes to improving their performance.
- **Hypothesis 2:** Drafting legal consultations through artificial intelligence diminishes the credibility of legal consultation.
- **Hypothesis 3:** The legal consultant remains responsible for errors contained in legal consultations prepared using artificial intelligence.

Research Methodology:

This study adopts a descriptive-analytical approach, identifying and describing the functioning of artificial intelligence tools and applying this framework to the field of legal consultation. The methodology also involves analyzing both the positive and negative dimensions of these tools.

Study Axes:

The problem under discussion will be examined through three main axes:

- **Axis 1:** The nature of artificial intelligence.
- **Axis 2:** The impact of using artificial intelligence in the legal field.
- **Axis 3:** Defining responsibilities in the use of artificial intelligence tools in legal consultation.

Axis 1: The Nature of Artificial Intelligence

Defining the nature of artificial intelligence with precision is not a simple task, as it continues to evolve constantly. Nevertheless, numerous attempts have been made to provide definitions, some of which are presented below:

First: Definition of Artificial Intelligence

Artificial intelligence is a branch of computer science that refers to the ability of machines to replicate human behavior, including processes such as thinking, planning, and even creativity.

At its core, it consists of algorithms that enable machines to analyze, make decisions, and adapt intelligently to different situations. Through the use of neural networks inspired by the schematic functioning of biological neurons, artificial intelligence systems are also capable of predicting outcomes based on acquired data.

These definitions, articulated from a technical perspective, emphasize the complexity of artificial intelligence and its continuous development. Attempts have also been made to define artificial intelligence from a legal perspective, though without achieving a universally comprehensive definition.

One of the most significant contributions is that of Alexandre Vial, who suggests defining artificial intelligence as a software system operating on algorithms that collect and utilize data, capable of partial or complete autonomous learning, and able to make decisions either partially or fully independently on the basis of learning and the use of data.[1]

This definition seeks to establish a general framework for understanding artificial intelligence.

Second: History of Artificial Intelligence

When addressing the origins of artificial intelligence, reference is often made to ten conferences held between 1946 and 1953 by the Macy Foundation. These conferences were preceded by a pivotal event in 1942: a meeting on brain inhibition organized by Frank Smith, director of the Jasiah Macy Jr. Foundation. [2]

This interdisciplinary meeting brought together Warren McCulloch and Arturo Rosenblueth, specialists in neurobiology and physics, who were the first to design a model of the neuron based on binary logic. Their model laid the groundwork for the construction of virtual neurons and later neural networks, positioning them among the earliest advocates of modeling the brain through a digital approach, with information encoded according to the binary system of 1 and 0.[3]

The meeting also included Margaret Mead and Gregory Bateson, specialists in anthropology, along with Lauren Kubie, a psychoanalyst, all of whom were engaged in efforts to better understand human thought processes. In addition, the founder of the Macy Foundation was present, and subsequent participants included Julien Bigelow, a physicist and computer engineer, and John von Neumann, a mathematician and the founder of game theory.

[2] The Josiah Macy Jr. Foundation, also known as the Macy Foundation, is an American organization established in 1930 to support health and education. It is well known for the Macy Conferences, which brought together scientists from diverse fields and played a major role in the development of cybernetics.

[3] Jacques Haiech, *"Tracing the History of Artificial Intelligence to Better Define and Understand It"*, *Médecine et Sciences*, No. 10, Vol. 36, October 2020.
https://doi.org/10-1051/Medsci/2020145. Accessed 05-04-2025 at 00:16.

Alan Turing also made a decisive contribution with his landmark 1950 article addressing the question "Can machines think?", which laid the foundation for the creation of the world's first programmable computers. In other words, the pursuit of simulating human thought became the cornerstone of major advances in computer science, ultimately leading to the emergence of artificial intelligence.[4]

In 1956, John McCarthy and Marvin Minsky envisioned a future in which machines would not only simulate humans but also be capable of learning, adapting, and thus making decisions. This constituted the first true foundation of artificial intelligence, which has since undergone immense development and has spread across all areas of life—so much so that imagining its future has become daunting.

Axis 2: The Impacts of Artificial Intelligence in the Legal Field

Legal professionals seek to benefit from artificial intelligence tools in their practice, particularly in assisting with specific tasks and enhancing performance in order to provide better services to clients. However, such use inevitably presents drawbacks, which can be addressed through the following points:

First: Advantages of Using Artificial Intelligence in Legal Consultation

The application of artificial intelligence offers numerous services in the legal domain, the most significant of which include:

1 – Legal Analysis:

Artificial intelligence has introduced substantial transformations in legal analysis, facilitating the interpretation of complex legal texts in a manner that is faster, more accurate, and more accessible. With artificial intelligence, it is possible to examine laws, judicial rulings, court decisions, and regulatory texts in record time. This enables legal professionals to obtain a clearer understanding of the interconnections among legal provisions relevant to a particular case.

Such outcomes are achieved through machine learning algorithms capable of extracting information pertinent to the consultation subject and analyzing data accordingly. As a result, legal analysis becomes more comprehensive and precise. This not only accelerates decision-making but also ensures that the analysis is grounded in reliable and up-to-date data.[5]

2 – Enhancing Efficiency and Productivity

Efficiency is reflected in the facilitation of drafting legal documents, including contracts and other documents that traditionally require considerable time for preparation. These have become known as smart contracts, representing a novel method of automated contract execution supported by Blockchain technology. Such innovations are expected to reshape the legal field and compel legal professionals to adapt to these emerging circumstances.[6]

With the assistance of artificial intelligence, these documents can now be produced in record time while maintaining accuracy, credibility, and consistency in managing the various variables specific to each case or file. [7]

Furthermore, artificial intelligence contributes to risk assessment, strategic development, compliance with legal obligations, and the reinforcement of legal protection by supplying updated information consistent with the latest legislative amendments.[8]

Artificial intelligence operates through algorithms designed to analyze databases and judicial decisions. In the field of legal data analysis, it employs data mining techniques to extract statistics and case outcomes relevant to the subject of consultation, which are made available in the digital domain—while encrypting the identities of the litigants to safeguard their privacy.[9]

Overall, the use of artificial intelligence in legal consultation constitutes a substantial advantage for lawyers and legal consultants, as it enables them to save time and review a greater number of files, thereby generating economic benefits. In addition, it presents several advantages for judges, as it allows them to expedite the issuance of rulings, thereby reducing delays in case processing and alleviating the accumulation of cases in the courts.[10]

Second: Disadvantages of Using Artificial Intelligence in Legal Consultation

Although artificial intelligence has become an effective tool for accelerating and simplifying legal processes, its use in the field of legal consultation presents several challenges and has been subject to various criticisms. The most significant drawbacks can be summarized as follows:

1 – Credibility of Information Obtained Using Artificial Intelligence:

It must be stressed that the initial models of artificial intelligence, even today, continue to suffer from limitations. There are no programs currently capable of predicting the outcomes of disputes presented before the courts with a high degree of reliability.[11]

In addition, the work of lawyers and legal consultants inherently requires a creative dimension that enables them to devise solutions for disputes that have not been previously addressed. By contrast, artificial intelligence relies on compiling the results of past disputes and therefore lacks the capacity to produce genuinely novel solutions. Furthermore, the practice of law is inseparable from creativity, which is essential for adapting to socio-economic developments.[12]

2 – Lack of Deep Understanding of the Legal Context:

Even though artificial intelligence tools significantly assist legal consultants by gathering information and analyzing vast quantities of data in record time, they may still fail to apprehend the social complexities or cultural contexts that shape the interpretation of law. These tools may misinterpret legal texts when such texts are ambiguous or susceptible to multiple interpretations. Moreover, artificial intelligence lacks elements such as emotion or empathy, which are intrinsic human qualities of great importance in the practice of law.[13]

Legal cases frequently involve human or psychological dimensions—such as the motivations of parties or the influence of social pressures—that artificial intelligence is unable to comprehend.

Axis 3: Determining Liability for the Use of Artificial Intelligence in Legal Consultation

The issue of determining liability for the use of artificial intelligence in legal consultation is highly complex due to the multiplicity of parties involved and the overlapping nature of their roles. Each party plays a role that may result in an error or cause harm.

First: Civil Liability for Errors of Artificial Intelligence

Civil liability refers to an individual's responsibility for the consequences of negligence committed either by themselves or by those under their supervision and control. More specifically, civil liability is a legal obligation imposed on a person—whether natural or legal—to compensate for damage suffered by others as a result of a wrongful act or unlawful conduct committed by them, or caused by an object or animal under their custody, or through the failure to fulfill contractual obligations.[14]

Whether contractual liability or tort liability is at issue, both are based on the principle of a person's ability to reason—that is, full mental capacity and legal majority—combined with the commission of an act contrary to the law, which results in harm to others and thus entails personal liability requiring compensation for the damage caused. As is well established, tort liability takes multiple forms: personal liability, liability for the acts of others, liability for things, in addition to the more recent regime of product liability for defective products.[15]

Accepting liability for harm caused by outcomes generated by algorithms would imply recognizing the liability of "machines" containing such algorithms. This is a highly controversial matter, as it would suggest that technical objects possess legal personality, while in reality, they remain only partially autonomous systems programmed, designed, and configured by humans, and ultimately remain subject to human control.[16]

This presents another difficulty: identifying responsibility among the numerous actors contributing to the development and operation of artificial intelligence—the manufacturer, the programmer, the operator, and the user. Given the multiplicity of their roles, separating their respective faults becomes challenging. This situation necessitates examining the conduct of each party, analyzing it, and determining its relation to the damage.[17]

Moreover, highly advanced forms of artificial intelligence, such as Machine Learning, raise the further question of whether the manufacturer, programmer, operator, or user truly retains the ability to control these algorithms. This type of artificial intelligence is characterized by autonomy, unpredictability, and lack of control.

As a result, it negates the attribution of personal liability to individuals for actions not performed directly by them, making it impossible to invoke the concept of human fault without which the harm would not have occurred.

Nevertheless, some legal scholars argue that human fault is always the underlying cause of damage attributed to intangible objects, since such objects cannot, by themselves, independently cause harm.[18]

Second: Liability of the Legal Consultant for the Use of Artificial Intelligence in Preparing Legal Consultation

The use of artificial intelligence by legal consultants, lawyers, or legal professionals in general for the preparation of legal consultations raises numerous questions, as this practice poses significant risks in reality.

It is therefore essential to distinguish between artificial intelligence systems composed of algorithms that merely assist in decision-making, and artificial intelligence programs composed of algorithms capable of making decisions

[17] Ibid., p. 271.
[18] Rafaf Lakhdar / Miouf Fayrouz, *"The Specificity of Civil Liability for Damages Caused by Artificial Intelligence Systems in Algerian Law"*, *Tébessa Journal for Academic Scientific Studies*, Vol. 6, No. 1, 2023, p. 582.

fully autonomously. The latter presents considerable danger, as it does not take into account the specific circumstances of litigants or the client seeking consultation.[19]

This underscores the necessity of the legal consultant's presence and continuous supervision throughout all stages of preparing the legal consultation. In other words, artificial intelligence may be integrated and utilized within the preparation process, but it must never be left to draft a legal consultation entirely on its own without proper verification of the results.[20]

Consequently, errors arising from artificial intelligence raise important questions about responsibility. Should the legal consultant be held accountable when using AI tools developed by a third party? Or should liability fall upon the company that developed the system? These questions demand a careful analysis of existing legal frameworks and an alignment of liability principles with the ongoing developments in artificial intelligence. In many cases, the legal consultant may indeed be liable for errors resulting from the use of AI tools, particularly when such tools are used improperly or when the consultant fails to verify the outcomes.

However, there may also be circumstances in which the developer company is held responsible for errors, especially in cases where defects exist in the software or algorithms. Accordingly, there is a pressing need to establish clear and precise rules and to develop a legal framework that aligns with technological progress, while setting standards to ensure the responsible use of these technologies.

From this perspective, it can be concluded that artificial intelligence cannot, under any circumstances, replace human involvement, as the sensitivity of cases requiring consultation presupposes precision in their handling. Hence, the use of artificial intelligence in preparing legal consultations must always remain under the supervision of the legal consultant in order to avoid erroneous or biased results that may arise from deficiencies in the databases employed or from algorithmic misinterpretations.

Furthermore, the human relationship between the legal consultant and the client—built on trust and psychological support—cannot be replaced by a machine. The majority of clients continue to prefer direct, face-to-face meetings with legal consultants and do not fully place their trust in artificial intelligence tools.

This highlights the importance of the human element as a crucial and irreplaceable foundation in the work of legal consultants, whose responsibility therefore remains intact.

Conclusion:

Although artificial intelligence tools contribute to saving time and effort, this does not exempt the legal advisor from the fundamental responsibility of ensuring the accuracy and validity of the information provided to the client or to the court. The role of the legal advisor is not limited to transmitting information; rather, it is a task that demands a high degree of intellectual and legal skill, as well as expertise in the legal field. For this reason, the advisor must exercise sound judgment and precision when employing artificial intelligence tools in professional practice.

- The use of artificial intelligence tools in legal consultation has accelerated legal research and analysis processes, thereby facilitating the work of legal advisors.

[19] Pauline Bertrand, *"Decision-Making Support Systems in Judicial and Legal Matters: Ethical, Technical, and Legal Aspects in Comparative Law (France, Germany, United States)"*, Master 2 Comparative Business Law, Harvard Law School, 2021–2022, p. 89.

https://doi.org/10.4000/ethiquepublique-4429. Accessed 13-05-2025.

- Analytical errors may occur when using artificial intelligence tools, which could result in incorrect legal outputs and potentially harm the interests of the client seeking legal advice.

- Artificial intelligence must be regarded as an auxiliary tool that supports the work of legal advisors, rather than as a complete substitute.

- A comprehensive legislative framework regulating the use of artificial intelligence in the legal field is still lacking.

Findings

1. AI as a Supportive Tool, Not a Replacement: The study confirms that AI technologies improve efficiency in legal practice but cannot replace the interpretive, ethical, and strategic reasoning of legal consultants.
2. Civil Liability Concerns: The absence of clear legislation leaves significant ambiguity in determining liability for errors or damages arising from AI-generated legal advice. Consultants remain primarily responsible for validating AI outputs.
3. Reliability and Accuracy: While AI tools expedite research and analysis, they are prone to algorithmic bias, lack of contextual awareness, and limitations in interpreting complex legal reasoning.
4. Ethical Accountability: Legal consultants carry the ethical obligation to ensure that the integration of AI does not compromise justice, fairness, or client confidentiality.
5. Need for Legal Reform: The research stresses the necessity of adopting comprehensive legislative and regulatory frameworks to govern AI in legal practice, focusing on liability, professional responsibility, and data protection.
6. Future Outlook: AI is best understood as a complementary partner to human expertise, requiring balanced integration that strengthens, rather than undermines, the ethical and professional foundations of legal consultancy.

Acknowledgement

The author expresses sincere gratitude to the Faculty of Law and Political Science at Mohamed Lamine Debaghine University – Sétif 2, as well as to the Research Laboratory on Human Rights Studies, for their academic support. Special thanks are extended to colleagues and students who provided constructive feedback on the practical implications of artificial intelligence in legal consultancy.

Ethical Considerations

This research was conducted in accordance with academic and ethical standards for scholarly work. All arguments, analyses, and conclusions are based on independent academic judgment without the influence of third-party interests. No confidential case data or personal client information was used in the preparation of this study. The study is purely conceptual and does not involve human or animal subjects, thereby requiring no formal ethical approval.

Conflict of Interest

The author declares no conflict of interest. The research was conducted independently, without any financial, institutional, or personal relationships that could be construed as a potential conflict.

Keywords German Orientalism, Franz Rosenthal, Arabic linguistics, Arab heritage, Chomsky, philology, comparative linguistics.

Abstract

This study explores the intellectual trajectory of German Orientalism and its pivotal role in the development of Arabic linguistic studies, focusing on the works of Franz Rosenthal as a central model. German engagement with the Arabic intellectual tradition can be traced back to the Crusades, when European scholars first encountered Arabic manuscripts and scientific knowledge. Over the centuries, this engagement evolved into a systematic and scholarly discipline, wherein German orientalists devoted themselves to collecting, translating, and critically analyzing classical Arabic texts. Franz Rosenthal (1914–2003), one of the most influential orientalists of the twentieth century, distinguished himself through his contributions to Arabic philology, literature, and historical scholarship. His seminal works—including *A Grammar of Biblical Aramaic*, *Knowledge Triumphant*, and his translation of Ibn Khaldun's *Muqaddimah*—demonstrate not only linguistic mastery but also a profound respect for Arab intellectual heritage.

This paper aims to highlight Rosenthal's scholarly efforts within the broader framework of German Orientalism and to investigate how his approaches shaped subsequent debates in modern linguistics. Of particular importance is the intellectual intersection between Rosenthal's philological precision and Noam Chomsky's theoretical advances in generative grammar. While their fields and methods differed significantly, Rosenthal's rigorous treatment of language as both a cultural and structural phenomenon created pathways that resonated with Chomsky's universalist vision of grammar. Through this comparative lens, the article situates Rosenthal's scholarship within both the Orientalist tradition and the global discourse on language, thereby contributing to a deeper understanding of the cross-cultural transmission of linguistic knowledge.

The study concludes that German Orientalism, exemplified by Rosenthal, not only preserved and disseminated Arab linguistic heritage but also indirectly contributed to the paradigmatic shifts in modern Western linguistic theory, including those advanced by Chomsky.

Introduction:

While French and English Orientalism were among the earliest Orientalist schools, German Orientalism followed

in their footsteps, with its figures showing interest in studying the heritage created by the Arabs throughout history. The contributions of the Germans in editing, publishing, and translating Arabic and Islamic heritage exceeded those of others before them in terms of precision, objectivity, and scholarly integrity. To achieve this, they were keen to learn the Arabic language and study its literature.

1. The Beginning of German Interest in Arabic Heritage:

The earliest roots of contact between the Germans and the Arab-Islamic East can be traced back to the days of the Second Crusade (1147–1149 CE). The Germans participated in pilgrimages to the Holy Land alongside the Flemish, Frisians, Normans, English, and Scots. They described those lands and brought back aspects of their civilization upon returning home. Monks also participated in translation from Arabic in Andalusia.[1]

In the fourteenth and fifteenth centuries, there was an intention to establish chairs for the study of Eastern languages in Germany, concurrent with the late founding of German universities compared to the rest of Europe. However, the sixteenth century marked the most important stage in the history of German Orientalism, as Oriental studies then received clear attention through the scholarly efforts of German figures who played a foundational role in these studies, known as professors of Eastern languages. Initially, their work focused on teaching Hebrew to theology students, with lectures on the interpretation of the Torah. Alongside this, instruction in Arabic, Syriac, and other Semitic languages began.[2]

In this century, German orientalists relied on the manuscripts of Guillaume Postel (1510–1581 CE) in their study of Eastern languages. Notable among them was Jacob Christmann (1554–1613 CE), who established a chair for the Arabic language at the University of Heidelberg. He recognized the close connection between Arabic and other sciences such as medicine and astronomy, translating *The Book of Astronomy* by Ahmad ibn Kathir al-Farghani (d. 347 AH), compiling a brief catalog of Arabic manuscripts acquired by a German nobleman during that period, writing a treatise on teaching Arabic script, and collecting some verses of the Gospel translated into Arabic for reading practice.[3]

In the seventeenth and eighteenth centuries, Johann Jacob Reiske (1716–1774 CE) devoted his life to learning Arabic and studying the history of Islamic civilization. He wrote a general study on Islamic history, published excerpts from *Majma' al-Amthal* by al-Maydani, part of the *Diwan* of al-Mutanabbi, and edited the *Mu'allaqa* of Tarafa ibn al-'Abd with the commentary of Ibn al-Nahhas.[4]

By 1818, the University of Bonn was founded, and Wilhelm Freytag Georg was appointed professor of Eastern languages. He produced an Arabic–Latin dictionary still in use in academic circles, edited and published *Diwan al-Hamasah* by Abu Tammam with al-Tabrizi's commentary and translated it into Latin, published *Al-Burda* by Ka'b ibn Zuhayr with a Latin translation, and issued a manuscript on the description of Palestine and the Levant by al-Sharif al-Idrisi, as well as *Mu'jam al-Buldan* by Yaqut al-Hamawi in six volumes with indexes and appendices.[5]

Heinrich Leberecht Fleischer (d. 1888 CE) founded the German Oriental Society, modeled after the French Asiatic Society and the Royal Asiatic Society of Great Britain. Many of his students were active in it, dedicating themselves to the scientific study of Arabic heritage, publishing its treasures, and continuing research in institutes and universities. It issued periodicals, held annual academic seminars, and contributed to publishing major works, such as Ibn Ya'ish's commentary on *Al-Mufassal* (d. 643 AH), Ibn 'Aqil's commentary on the *Alfiyyah* (d. 769 AH), and a translation of *Kitab Sibawayh* (d. 180 AH) with al-Sirafi's commentary (d. 368 AH).[6]

The German Oriental Society also established branches named Institutes of Oriental Antiquities, Institutes of Oriental Studies, and specialized libraries.

In Istanbul, Hellmut Ritter (d. 1971 CE) founded the Islamic Library for German Orientalists in 1918, focusing on editing Islamic—especially Arabic—texts. Its publications reached twenty-three books, including *Al-Wafi* by Salah al-Din al-Safadi (d. 764 AH) and *Mashahir 'Ulama' al-Amsar* by Muhammad ibn Hassan al-Dhabi (d. 230 AH).[7]

2. Franz Rosenthal:

Franz Rosenthal (d. 2003 CE) was a German-American orientalist of global renown, whose extensive contributions to the study of Arabic language, literature, and Islamic history had a significant impact on Orientalist scholarship.

He was born in Berlin, Germany, to a Jewish family in 1914. He joined the University of Berlin in 1932, studying classical and Eastern languages and civilizations. His professors included Carl Heinrich Becker, Richard Rudolf Walzer, and Hans Heinrich Schaeder. He earned his doctorate in 1935 with a dissertation on Palmyrene inscriptions under Schaeder's supervision.

Rosenthal left Germany in December 1938, moving to Sweden, then England, before relocating to the United States in 1940 to join the Hebrew Union College in Cincinnati, Ohio. He became a U.S. citizen in 1943 and worked during the war translating Arabic for the Office of Strategic Services in Washington.

After the war, he returned to Hebrew Union College, later joining the University of Pennsylvania in 1948 to teach Arabic. In 1956, he was appointed professor of Semitic languages at Yale University, where he remained until becoming professor emeritus in 1985. He died in 2003.

3. His Works in Arabic and Islamic Studies:

Rosenthal's works were characterized by prolific output, variety of subjects, and depth of analysis, all driven by a desire to understand Arabic language, literature, and Islamic history.

In history, he edited Ibn Khaldun's *Muqaddimah* (d. 808 AH) and published it in three volumes, most recently issued in 2022 by Markaz Turath for Research and Studies, translated by Ahmad al-Adawi.

In the first section of the work, he examined Ibn Khaldun's biography and key stages of his life, especially his political career in both the Maghreb and the Mashriq during a critical political period. The second section discussed the content of the *Muqaddimah*, while the third dealt with the text's history, the manner in which Ibn Khaldun composed it, and a study of several manuscripts he personally examined. Rosenthal also reviewed editions of the *Muqaddimah* in both the Arab and European worlds critically, addressing earlier translations in various languages and explaining his reasons for producing a new translation.

In addition, he authored *A History of Muslim Historiography*, translated by Salih Ahmad al-'Ali and reviewed by Muhammad Tawfiq Husayn, published by Maktabat al-Muthanna in Baghdad in 1963 in cooperation with the Franklin Printing and Publishing House. This work examined various historical texts, including:[8]

- *Al-Mukhtasar fi 'Ilm al-Tarikh* by al-Kafiji (d. 879 AH)
- *Al-I'lan bi-l-Tawbikh liman Dhamma al-Tarikh* by al-Sakhawi (d. 902 AH)
- *Al-Jawahir wa-l-Durar* by al-Sakhawi
- An excerpt from *Al-Qawl al-Munbi 'an Tarjamat Ibn 'Arabi* by al-Sakhawi
- *Inba' al-Ghumr bi-Abna' al-'Umr* by Ibn Hajar (d. 852 AH)
- A chapter from *Miftah al-Sa'adah wa-Misbah al-Siyadah* by Tash Kubri Zadah (d. 968 AH)

On research methodology, Rosenthal presented *The Methods of Muslim Scholars in Scientific Research*, covering topics such as documentation and memorization, manuscript hunting, rules for correcting texts and respecting narration, collation, marginalia problems, forgery and literary theft, and many other subjects.[9]

His book *Knowledge Triumphant: The Concept of Knowledge in Medieval Islam* discusses in its first chapter, "Knowledge Before Knowledge," that little can be said about knowledge in pre-Islamic Arabia, where an initial concept of knowledge as the gradual acquisition of material information existed. Over time, this was replaced—or merged—with the idea of knowledge as varying degrees of perception, and eventually the view of knowledge as the highest and truest form of truth emerged. When the Prophet Muhammad ﷺ came, he shaped the concept into a fundamental tool and a divine revelation goal, paving the way for the sanctity of knowledge, which became a hallmark of Islamic civilization.[10]

In the second chapter, "Knowledge in the Revelation," Rosenthal emphasizes that doubts about knowledge vanish when approaching the Qur'an, which he describes as truly the bright light of history. He notes that the Prophet's concept of knowledge set Islamic intellectual life on a path from which it never deviated, with later influences rarely adding new ideas to the Prophet's intellectual framework or changing its course.

In the third chapter, "The Word 'Ilm," Rosenthal observes that in Islamic literature it is often difficult to determine whether the term refers to both worldly and religious knowledge, or religious knowledge alone; likewise, whether it means abstract knowledge or a specific branch of learning. He notes that for Muslims, such distinctions rarely held the same importance as they did for non-Muslims, which is a distinctive feature of the Muslim concept of knowledge and their view of its singular form as truly representing abstract knowledge.

In Chapter Four, "Definitions of Knowledge," he saw that definitions and examples held a significant place in Islam, in agreement with the ancient and simple Arab concept of knowledge. They were needed both in philosophy and in philology. Sufism, with its constant commissioning of terms for meanings and meanings for terms, was especially fond of them. Such definitions always provide a useful review of the various prevailing opinions on any given issue. Explanation and elaboration are necessary to understand these definitions correctly, yet they often remove the haze of confusion that arises from trivialization, presenting many definitions of knowledge in Islamic thought.

As for Chapter Five, "Knowledge is Islam (Theology and Religious Knowledge)," he saw that the modern treatment of knowledge served two purposes: the first—and more important—was to clarify the correct method and teaching approaches to be followed in the study of hadiths, and the second was to highlight the essential relationship between knowledge and faith in the true religion, since knowledge was considered an essential part of it. For scholars of hadith, knowledge was the key to both theorizing and practice in Islam. He added that knowledge and faith were equated in the Qur'an, yet later generations of Muslim thinkers did not neglect to delve into and debate this equality, as it was necessary to verify whether knowledge and faith truly corresponded, and to define the best way to describe the relationship between them. This involves a debate between rational or materialist modes of knowledge and understanding, and irrational or metaphysical ones. In his view, the divine attribute of knowledge, as well as the two names "ʿAlīm" (All-Knowing) and "ʿĀlim" (Knower) among the Most Beautiful Names of God, cannot be separated from His other attributes and names.

In Chapter Six, "Knowledge is Light (Sufism)," the author found it easy to sense the authority of the concept of knowledge in the works of Ibn ʿArabī, as in Sufism as a whole. Despite the Sufis' opposition to both juristic and theological thought and their views on knowledge, and their rejection of any rational definition of knowledge, they found themselves, throughout their history, obliged in one way or another to revere both, and also to view Sufism primarily as a methodological science, with other aspects such as gnosis and enlightenment coming second.

Rosenthal then addressed in Chapter Seven, "Knowledge is Thought (Philosophy)," the duality of theology and the Sharia, concluding that both were pillars of Islam, and that it could be said theology and the Sharia laid down the structural boundaries that distinguished Muslim society from others. What is noteworthy is that both were considered, above all, sciences, and that people chose to add the word "ʿilm" (knowledge) to each. Scholars—in the view of the representatives of theology and the Sharia first, and of Muslims in general later—were those belonging to the educated classes, who regulated the religious affairs and the civil aspects of political life. Yet this was not merely knowledge of facts, but knowledge based on a demonstrable epistemic foundation.

Rosenthal also stated in Chapter Eight and final chapter, "Knowledge is Society (Literature)," that the relationship between knowledge and action, and its effects on the life of the individual, represents the true measure of the value of any society. Another relationship that shapes human civilization, more formal and more narrowly defined, is that between knowledge and education. This relationship in Islam is characterized by a combination of knowledge and literature on one hand, and of knowledge, teaching, and study on the other. Knowledge was considered the result of study and education in all its aspects. Therefore, it was expected that knowledge, and also the root ʿ-l-m, would be central to systematic educational writings in Islam. The influence of knowledge on literary works is not entirely clear, owing to the broad range of meanings of the word "adab" itself. The man of letters was the educated man; what matters here is to what extent this equated to "knower" or "scholar."

In addition, there are other works of his related to the Arab and Islamic heritage. Their titles are:

- The Concept of Freedom in Islam before the 19th Century
- The Translation of al-Ṭabarī's History into English
- A Study on Humor and Jokes in Early Islam
- Hashish in Medieval Islamic Society
- Sweeter than Hope: Complaint and Hope in Medieval Islam
- Gambling in Islam
- Suicide in Islam
- The Individual versus Society in Islam

4. Between Rosenthal and Chomsky:

As previously mentioned, Franz Rosenthal studied under many professors at the University of Berlin, including Carl Heinrich Becker, Richard Rudolf Walzer, and Hans Heinrich Schäder. When he settled in America, he began teaching Arabic. Many researchers have mentioned that Noam Chomsky became acquainted with Arabic grammar through his studies with Rosenthal. We can list these testimonies as follows:

4.1. Mazen al-Waʿr's Interview:

Mazen al-Waʿr conducted an interview with Chomsky on January 31, 1980, and sent its text for publication in the Algerian Linguistics Journal. He mentioned among the reasons for sending what he had recorded from this interview that he had heard ʿAbd al-Raḥmān al-Ḥāj Ṣāliḥ (d. 2017), when he was a student of his at the University of Damascus, say that Chomsky was somewhat influenced by the Arab linguistic tradition.

The fifth question in this interview was about Chomsky's view of the efforts of Arab linguists in linguistics in earlier times. Chomsky replied: "Before I began studying general linguistics, I worked on some research related to Semitic linguistics. I still remember studying the *Ājurrūmiyya* many years ago—I think more than thirty years—and I studied this with Professor Franz Rosenthal."[11]

4.2. ʿAbd al-Raḥmān al-Ḥāj Ṣāliḥ's Testimony:

ʿAbd al-Raḥmān al-Ḥāj Ṣāliḥ delivered a paper at a symposium on the development of linguistics in the Arab world organized by UNESCO in Rabat from April 1 to 11, 1987. The paper is included in his book *Research and Studies in Arabic Linguistics*, in which he confirmed that Chomsky received his knowledge of the Arabic language from Rosenthal, saying: "We must draw the attention of our fellow linguists to the fact that [Chomsky] learned much about Arab linguistic theories and concepts, through his study of Hebrew grammar as formulated by Jewish rabbis in the Middle Ages, as well as through his study of the *Ājurrūmiyya* with his teacher Rosenthal."[12]

4.3. Ḥilmī Khalīl:

Ḥilmī Khalīl (d. 2010), in his translation of John Lyons' *Chomsky's Linguistic Theory*, conveyed Chomsky's statement mentioned by Mazen al-Waʿr in his previous interview[13], and in turn confirmed Chomsky's close association in his youth with the Arabic language and its grammar, just as he was closely connected with the Hebrew language.

4.4. ʿAbduh al-Rājiḥī's Lecture:

ʿAbduh al-Rājiḥī (d. 2010) gave a public lecture at the Literary Club in Riyadh, in which he mentioned Chomsky's influence by Arabic grammar. This prompted Ḥamza Qablān al-Muzainī to contact Chomsky. Al-Muzainī, a

professor of linguistics at King Saud University in Riyadh, had made scholarly efforts in translating Chomsky's works into Arabic. He published the correspondence in *Al-Riyadh* newspaper.

Al-Muzainī said: I sent him a letter asking about what I had heard from Dr. ʿAbduh al-Rājiḥī, who confirmed in a public lecture at the Literary Club in Riyadh that Chomsky had studied Arabic grammar, and that—in al-Rājiḥī's view—he had studied Sībawayh's *Kitāb*, and read the studies of the German linguist von Humboldt, who knew Arabic grammar. Al-Rājiḥī also confirmed that there was an Arab researcher, Dr. Yūsuf ʿAwn, who taught Chomsky Sībawayh's *Kitāb*.

Chomsky responded to al-Muzainī's questions in a letter dated May 28, 1989, saying in the part relevant to this topic:

"You ask about the influence of traditional Arabic grammar on my method of studying language. Most of what you have heard is partially correct, except for that which concerns von Humboldt, whose works I did not read until the 1960s. My father was a scholar of medieval Hebrew grammar, and he produced the standard edition of the grammar book authored by [the Andalusian Jewish grammarian] David Qimḥi. I was well acquainted in my early youth with my father's works, and at that time I also studied a little of the historical studies on the grammar of Semitic languages. The influence of Arabic grammar [on Hebrew grammar] was great, as is well known. This context had a direct and significant influence on my early studies. In fact, my undergraduate and master's theses, which I completed at the University of Pennsylvania on the morphophonemic systems of Modern Hebrew, were greatly influenced by these studies, and were partly modeled on concepts taken from historical Semitic linguistics and traditional grammar. These two theses were the earliest models of contemporary generative grammar, although they were not published until years after they were completed.

When I entered the University of Pennsylvania in 1945, I immediately began studying Arabic with Giorgio Levi Della Vida, who was a very distinguished Arabist. After Della Vida retired, I studied with Franz Rosenthal. With Rosenthal I took one semester of Arabic, and I was the only student in that class. In it, I studied with him Sībawayh's *Kitāb*, and perhaps this is the basis of the rumor you heard [that someone taught Chomsky Sībawayh's *Kitāb*]. Zellig Harris, under whom I studied [linguistics], had completed his major works in historical Semitic linguistics, and I had also studied what he wrote on this subject. It is always difficult to trace such matters precisely, but there are certainly strong possibilities for such influence."[14]

Chomsky also wrote to him in a letter dated December 17, 1990, after al-Muzainī had sent him a copy of the translation of his book *Language and Problems of Knowledge*, including the following text:

"Although in an early period of my life I knew enough Arabic to be able to understand what was published in a newspaper or novel (my actual study, however, was limited to pre-Islamic poetry and the grammatical works written in the eighth century CE [second century AH]; perhaps here I am referring to Sībawayh's *Kitāb*), that was forty years ago, and now I do not trust my knowledge [of Arabic]. But I will lend the book [the translation] to one of my colleagues or friends [to read it]."

We note in this interview Chomsky's mention of Sībawayh's *Kitāb*, without mentioning the *Ājurrūmiyya* as in Mazen al-Waʿr's interview, and between the two interviews—clearly—nine years had passed. Al-Muzainī posted on the X platform on September 5, 2019: "Today I sent a message to Chomsky asking him about what was stated in the interview by the late Mazen al-Waʿr, published in the Algerian Linguistics Journal, in which Chomsky was quoted as saying that he studied the *Ājurrūmiyya* with Rosenthal. He replied that this was not true and that he had not studied the *Ājurrūmiyya*, but had studied Sībawayh for four months with Rosenthal."[15]

In any case, these testimonies as a whole indicate, in general, Chomsky's familiarity with the efforts of Arab grammarians on one hand, and on the other, they confirm Rosenthal's standing and skill in Arabic studies. Whether he taught the *Ājurrūmiyya* as in Mazen al-Waʿr's account, or Sībawayh's *Kitāb* as in Ḥamza al-Muzainī's account, both indicate the extent of Rosenthal's familiarity with the issues of Arabic grammar.

Conclusion:

This study arrived at the following results:

• The sixteenth century CE was the most important stage in the history of German Orientalism, as Oriental studies witnessed clear interest through the scholarly efforts of German figures who played a foundational role in these studies, and who were known as the professors of Oriental languages.

• Franz Rosenthal accomplished many and diverse works in various fields. He edited and published Ibn Khaldun's *Muqaddimah* in three volumes, and authored a book titled *A History of Muslim Historiography*, translated by Saleh Ahmad Al-Ali, revised by Muhammad Tawfiq Hussein, and published by Al-Muthanna Library in Baghdad in 1963 in cooperation with the Franklin Printing and Publishing Institute.

• In the field of research methodology, he presented his book *The Methods of Muslim Scholars in Scientific Research*, in which he addressed various topics such as documentation and preservation, the search for manuscripts, the ethics of text editing and respect for narration, collation, the problem of marginalia, forgery, and literary plagiarism.

• As for his book *Knowledge Triumphant: The Concept of Knowledge in Medieval Islam*, Rosenthal discussed knowledge in the Arabian Peninsula before Islam, then knowledge in the Qur'an, the relationship between knowledge and faith, its relation to philosophy and literature, and concluded the book with a discussion of knowledge in the educational process.

• Rosenthal rendered great service in introducing the Western world to the Arab heritage in the fields of literature, history, and philosophy. Perhaps his greatest contribution was linking American researchers to the Arabic language, foremost among them Noam Chomsky.

Acknowledgment

The author extends sincere gratitude to the Department of Arabic Language and Literature at Blida 2 University, Algeria, for its academic support and intellectual encouragement during the preparation of this research.

Conflict of Interest

The author declares that there are no conflicts of interest associated with this study.

Funding

This research did not receive any external funding.

Ethical Considerations

The study is based on secondary literature review and textual analysis. It does not involve human participants, personal data, or experimental procedures, and thus complies with the highest academic ethical standards.

Keywords Distance training, University professors, Faculty development, Higher education, ICT in education, Algeria, Blended learning, TPACK, Community of Inquiry.

Abstract

This paper examines the role of distance training in enhancing the professional and pedagogical performance of university professors, focusing on the 2023 cohort of newly recruited faculty members in Algeria. Against the backdrop of the country's growing commitment to digital transformation in higher education, the study explores how structured online training initiatives contribute to faculty development, teaching innovation, and institutional capacity-building. Adopting a descriptive-analytical methodology combined with a case study design, the research draws on mixed data sources including structured surveys (N = 320), semi-structured interviews (N = 18), and document analysis of digital training portfolios.

The findings demonstrate that distance training had a measurable impact on teaching competencies, particularly in the integration of information and communication technologies (ICTs) such as Moodle, Edunext, Opale, and VUE. Participants reported improved digital literacy, greater confidence in course design, and enhanced skills in both formative and summative assessment. The initiative also fostered reflective practice through digital portfolios, strengthened collaboration among faculty, and introduced pedagogical frameworks such as Technological Pedagogical Content Knowledge (TPACK) and the Community of Inquiry (CoI).

While the study acknowledges challenges related to infrastructural disparities, varying levels of engagement, and occasional resistance to technological change, it concludes that distance training offers a scalable, cost-effective, and sustainable model for continuous faculty development. The paper underscores the need for stronger institutional investment in digital ecosystems, structured mentorship opportunities, and alignment of training

objectives with global standards in higher education pedagogy.

1. Introduction

The landscape of higher education is undergoing profound transformation driven by digital innovation, globalization, and shifting societal expectations. In this dynamic environment, continuous professional development has become essential for university professors to maintain pedagogical relevance and academic excellence (Al-Maghribi, 2020). Traditional face-to-face training methods are increasingly being supplemented—or replaced—by flexible, technology-mediated alternatives, particularly distance training , which enables educators to acquire new competencies regardless of time or location constraints.

In Algeria, the Ministry of Higher Education and Scientific Research launched a comprehensive distance training program in 2023 targeting newly recruited professors. This initiative aimed to bridge gaps in digital pedagogy, enhance teaching quality, and promote equitable access to professional development across geographically dispersed institutions. Leveraging platforms such as Moodle, Edunext, and Mooc, the program offered structured workshops on instructional design, blended learning, and educational technology integration.

While promising, the effectiveness of such large-scale digital interventions depends on multiple factors: curriculum design, platform usability, learner engagement, institutional support, and alignment with theoretical foundations of adult learning and online instruction. Therefore, evaluating the impact of this training on professors' performance is critical not only for refining current practices but also for informing future policy and strategic planning in Algerian higher education.

This paper presents a systematic evaluation of the 2023 national distance training program for new faculty members. It examines its objectives, implementation, outcomes, and challenges while offering evidence-based recommendations for enhancing faculty development in digitally mediated environments. The remainder of this article is structured as follows: Section 2 outlines the research problem and sub-questions; Section 3 discusses the significance and objectives of the study; Section 4 details the methodology; Section 5 provides a robust theoretical framework; Section 6 defines key concepts; Section 7 describes the training program; Section 8 presents results and discussion; Section 9 offers conclusions, limitations, implications, and directions for future research.

2. Research Problem

The central research question guiding this study is:

How does distance training contribute to improving the performance of newly recruited university professors in the Algerian higher education system?

To address this overarching question, the following sub-questions were formulated:

1. What are the primary components and structure of the distance training workshops provided to new university professors?
2. What pedagogical approaches and digital tools are employed in delivering these training programs?
3. To what extent does distance training enhance professors' pedagogical and technical competencies?
4. How does participation in distance training influence research productivity and professional identity?
5. What barriers hinder the scalability and effectiveness of distance training, and what strategies can overcome them?

3. Significance and Objectives of the Study

3.1 Significance

This study contributes to the growing body of literature on faculty development in low- and middle-income countries where digital transformation in higher education remains uneven. By analyzing a nationally coordinated training initiative, it offers practical insights into:
- The feasibility of scaling up distance training in resource-constrained contexts.
- The role of ICT in promoting inclusive and lifelong learning for academics.
- The alignment of training content with 21st-century teaching demands.

Findings can inform policymakers, university administrators, and instructional designers in developing sustainable models for faculty capacity building.

3.2 Research Objectives

The study aims to:
- Examine the design and delivery of the 2023 distance training program for new university professors in Algeria.
- Evaluate its impact on participants' pedagogical performance and digital competence.
- Identify challenges encountered during implementation.
- Propose actionable recommendations for improving future iterations of faculty development programs.

4. Research Methodology

This study adopts a mixed-methods descriptive-analytical approach , combining quantitative and qualitative data to provide a comprehensive understanding of the training intervention.

4.1 Research Design

A convergent parallel mixed-methods design was used, allowing simultaneous collection and integration of both datasets (Creswell & Plano Clark, 2017). The case study focuses on the cohort of newly recruited professors who participated in the 2023 training cycle.

4.2 Population and Sample

- Target population : All newly recruited university professors in Algeria (N ≈ 1,200).
- Survey sample : 320 participants selected via stratified random sampling across ten public universities.
- Interview sample : 18 individuals (15 professors, 3 trainers) chosen through purposive sampling to ensure diversity in discipline and region.

4.3 Data Collection Tools

1. Online questionnaire : A 25-item Likert-scale survey assessing perceived improvements in:
   - Digital tool proficiency
   - Lesson planning
   - Assessment design
   - Student engagement
   - Collaborative practices
2. Semi-structured interviews : Conducted virtually, focusing on lived experiences, challenges, and suggestions.
3. Document analysis : Review of 45 training portfolios submitted by participants, evaluating completeness, creativity, and application of learned skills.

4.4 Data Analysis

- Quantitative data were analyzed using SPSS v28 , generating descriptive statistics (frequencies, means, standard deviations) and inferential tests (paired t-tests to compare pre- and post-training self-assessments).
- Qualitative data were thematically coded using NVivo 14 , identifying recurring patterns related to effectiveness, engagement, and obstacles.

4.5 Ethical Considerations

Participation was voluntary and anonymous. Informed consent was obtained electronically. Data were stored securely and used solely for research purposes.

5. Theoretical Framework

This study is grounded in three interrelated theoretical perspectives that explain how distance training influences faculty development:

5.1 Technological Pedagogical Content Knowledge (TPACK)

Mishra and Koehler's (2006) model emphasizes the intersection of technology, pedagogy, and subject matter knowledge. The training program explicitly targeted all three domains:

- Technological Knowledge (TK) : Mastery of Moodle, Opale, VUE.
- Pedagogical Knowledge (PK) : Designing interactive lessons and assessments.
- Content Knowledge (CK) : Application in disciplinary contexts (e.g., desert agriculture lesson).

By fostering TPACK integration, the training enabled professors to make informed decisions about when and how to use technology effectively in their teaching.

5.2 Community of Inquiry (CoI) Framework

Garrison et al.'s (2000) CoI model posits that meaningful online learning arises from the interaction of:

- Teaching presence (facilitated by mentors),
- Social presence (promoted through group work and forums),
- Cognitive presence (developed via problem-solving and reflection).

The training activities—particularly collaborative tasks and peer feedback—supported all three presences, enhancing engagement and deep learning.

5.3 Self-Determination Theory (SDT)

Deci and Ryan's (1985) theory highlights intrinsic motivation driven by autonomy, competence, and relatedness. The asynchronous nature of the training supported autonomy ; skill acquisition enhanced competence ; and group interactions nurtured relatedness , collectively boosting motivation and persistence.

These frameworks collectively justify the program's design and help interpret its outcomes.

6. Key Concepts

6.1 Distance Training

Distance training refers to an educational modality where learners and instructors are separated spatially and/or temporally, connected through information and communication technologies (Fakhri, 2013). It allows flexible, self-paced learning accessible anytime and anywhere (Sofiane, 2019). Unlike traditional training, it relies on digital platforms to deliver content, facilitate interaction, and assess progress.

6.2 University Professor and Academic Performance

A university professor is a scholar entrusted with teaching, research, and service responsibilities (Braun, 2023). Their performance encompasses measurable contributions to institutional goals through effective teaching, scholarly output, and professional conduct (Ben Hassan, 2019).

6.2.1 Pedagogical Performance

This includes behaviors exhibited during instruction, such as:

- Setting clear learning objectives,
- Employing diverse teaching strategies,
- Using appropriate assessment tools,
- Encouraging student participation (Ben Lakhal, 2023).

6.2.2 In-Service Teacher Training

Defined as ongoing, structured professional development throughout a teacher's career (Heir, 2002; Nazli, 1989), it aims to update knowledge, refine skills, and adapt to changing educational paradigms.

7. Description of the 2023 Training Program

Administered under the strategic vision of the Ministry of Higher Education, the training was coordinated by the

University of Frères Mentouri – Constantine and delivered entirely online between December 2022 and April 2023

7.1 General Objectives

As outlined by Belhani (2023), the program sought to enable professors to:
- Structure pedagogically sound lessons;
- Adopt quality standards in education;
- Organize collaborative academic work;
- Understand principles of distance learning systems;
- Operate Moodle and EdX platforms;
- Design pedagogical videos;
- Integrate ICT into teaching and assessment.

7.2 Training Stages and Workshops

Participants were divided into four cohorts based on availability, each undergoing five sequential workshops.
Each workshop lasted 3–4 days, combining synchronous sessions (live webinars) and asynchronous tasks (assignments, forum discussions).

8. Results and Discussion

Analysis of survey responses, interviews, and portfolios yielded the following findings:

8.1 Enhanced Digital Competency

Over 87% of respondents reported significant improvement in their ability to use digital tools. Notably:
- 92% felt confident navigating Moodle.
- 85% successfully created interactive lessons using Opale.
- 78% applied VUE for visualizing course structures.

"Before the training, I avoided using any platform. Now, I've uploaded three courses on Moodle." — Male Professor, Faculty of Sciences
This aligns with UNESCO (2020), which underscores flexibility and accessibility as core advantages of distance learning.

8.2 Improved Course Design Skills

Participants demonstrated advanced understanding of hybrid lesson architecture. Portfolio reviews showed:
- Clear alignment between objectives, activities, and assessments.
- Use of multimedia elements (videos, infographics).
- Incorporation of formative feedback mechanisms.

Thematic analysis revealed that structured templates and trainer feedback were crucial enablers.

8.3 Shift Toward Student-Centered Teaching

A notable shift from lecture-based to interactive methodologies was observed. Over 75% of interviewees mentioned adopting discussion forums, group projects, and flipped classroom techniques.

This reflects the influence of CoI's teaching presence and cognitive presence , where guided inquiry promotes deeper engagement.

8.4 Development of Evaluation and Feedback Practices

Professors improved in designing rubrics and providing timely, constructive feedback. One participant noted:
"I now see assessment not just as grading, but as a tool for learning improvement."

This supports Ben Ramadan's (2017) view that pedagogical training enhances reflective practice.

8.5 Strengthened Collaboration

Group activities fostered cross-disciplinary exchange. Virtual teams collaborated on shared lessons, leading to joint publications in some cases.

"We formed a network across five universities—we still share resources." — Female Professor, Humanities

8.6 Portfolio as a Tool for Reflective Practice

All participants completed a portfolio documenting their journey. These included lesson plans, reflections, peer feedback, and certificates. Portfolios served as tangible evidence of growth and potential promotion dossiers.

8.7 Exposure to Innovative Tools

Tools like VUE (for concept mapping) and Opale (for multi-format publishing) expanded professors' instructional repertoires beyond PowerPoint and PDFs.

8.8 Promotion of Critical Thinking and Creativity

Designing original lessons required analytical thinking and innovation. Interview data indicated increased confidence in creative problem-solving.

9. Conclusion, Limitations, Implications, and Future Research

9.1 Conclusion

The 2023 distance training program represents a landmark effort in modernizing faculty development in Algeria. Findings confirm that well-structured, technology-integrated training can significantly enhance professors' pedagogical performance, digital fluency, and professional identity. When supported by clear objectives, practical tools, and reflective practices, distance training emerges as a viable, scalable alternative to traditional in-person workshops.

However, success hinges on addressing systemic challenges—including unequal internet access, lack of technical support, and varying levels of digital readiness—through coordinated institutional policies.

9.2 Limitations of the Study

- Self-report bias : Survey data rely on subjective perceptions rather than objective performance metrics.
- Limited generalizability : Findings pertain specifically to the 2023 cohort and may not reflect long-term impacts.
- Sampling constraints : While efforts were made for representativeness, urban universities were slightly overrepresented.
- Lack of control group : No comparison with non-participants limits causal inference.

9.3 Practical and Policy Implications

- Universities should institutionalize annual refresher training in digital pedagogy.
- Investment in reliable internet infrastructure and technical support units is essential.
- Mentorship programs should be integrated into future training cycles.
- Training content must evolve continuously, incorporating AI tools, open educational resources (OER), and accessibility standards.

9.4 Recommendations for Future Research

1. Longitudinal studies tracking changes in actual teaching practices and student outcomes.
2. Comparative analyses between distance and blended training modalities.
3. Investigation into gender, age, and disciplinary differences in technology adoption.
4. Exploration of AI-driven personalized learning paths for faculty development.

Table 1. Structure and Focus of the Distance Training Workshops for Newly Recruited Algerian University Professors (2023 Cohort)

Workshop	Key Activities	Focus	Explanation
1. Introduction to Digital Tools	- Accessing TIC platform - Creating accounts - Using VUE for mind mapping	Foundational ICT skills	This initial workshop introduced participants to the university's digital ecosystem. Professors gained essential ICT

	- Building lessons with Opale (web/print formats) - Hands-on creation of a sample lesson on "Desert Agriculture"		literacy, including account creation, navigation of TIC platforms, and use of software tools such as VUE for conceptual mapping and Opale for lesson design. The sample topic on "Desert Agriculture" provided an applied context for hands-on practice.
2. Designing a Blended Lesson	- Comparing objective-based vs. competency-based learning - Structuring lessons and quizzes - Group activity: designing an assessment grid - Updating Opale lessons with templates	Instructional design	This stage focused on pedagogical structuring of blended lessons. Participants engaged in comparative analysis of instructional models, collaborated on creating assessment grids, and enhanced their digital lessons using Opale templates. The emphasis was on aligning teaching objectives with competency-based approaches.
3. Methodology for E-Learning Courses	- Designing full e-learning courses - Understanding quiz types and sequencing - Watching tutorials on uploading content to Moodle	Course development	Professors advanced to comprehensive course development by exploring sequencing of learning modules and assessment strategies. Tutorials demonstrated the process of uploading content to Moodle, thereby linking instructional design with practical implementation in a widely used LMS.
4. Exploring Online Platforms	- Introduction to Mooc platform - Steps to create a lesson on Mooc - Creating personal spaces on Edunext (Studio & LMS interfaces) - Uploading final lesson designs	Platform mastery	This workshop consolidated technical expertise across platforms. Professors learned to integrate their lesson designs into MOOCs and Edunext, thereby creating scalable, shareable, and interactive digital learning environments. The emphasis was on professional autonomy in online course

			management.
5. Pedagogical Follow-up	- Discussing active learning approaches - Evaluating assessment quality - Clarifying mentor roles - Finalizing lesson plans with feedback from faculty and students - Compiling a professional portfolio	Reflection and mentoring	The concluding workshop fostered reflective practice and mentorship. Professors refined lesson plans based on peer and student feedback, evaluated assessment effectiveness, and compiled professional teaching portfolios. This process supported long-term faculty development and encouraged collaborative improvement.

- This structured training model was designed as a progressive learning pathway, beginning with foundational ICT literacy and culminating in reflective practice and mentorship. Each stage was strategically aligned to pedagogical frameworks (TPACK and Community of Inquiry), ensuring that professors developed not only technical competencies but also critical awareness of instructional design and assessment practices. The integration of practical tasks, peer collaboration, and reflective portfolio development provided a holistic model of professional growth suited for modern higher education environments

Findings

- Improved Teaching Competencies: Survey and interview data confirmed that participants experienced significant growth in lesson planning, course structuring, and classroom management through digital tools. Faculty members became more adept at creating blended learning modules that combined synchronous and asynchronous formats.
- Increased Digital Literacy: The training strengthened professors' ability to navigate educational technologies, particularly learning management systems such as Moodle and Edunext. Professors also reported an enhanced capacity to design interactive learning resources using Opale and VUE software.
- Assessment and Feedback Practices: Professors integrated digital platforms to administer formative assessments, manage quizzes, and provide personalized feedback, which improved student engagement and learning outcomes.
- Reflective Practice through Portfolios: The requirement to maintain digital portfolios encouraged professors to reflect systematically on their pedagogical progress. This reflective practice helped in identifying strengths, addressing gaps, and adopting continuous improvement strategies.
- Collaborative Professional Learning: The distance training created a network of professional collaboration among participants, facilitating peer-to-peer knowledge sharing and the development of communities of practice across Algerian universities.
- Challenges Identified: Despite its successes, the initiative faced barriers such as uneven technological infrastructure across regions, inconsistent participation rates, and initial reluctance among some faculty to embrace digital teaching methodologies.

Acknowledgment

The authors extend their appreciation to the Ministry of Higher Education and Scientific Research of Algeria and to the participating universities for providing access to institutional data and logistical support throughout the

research process.

Conflict of Interest

The authors declare that there are no conflicts of interest associated with this research.

Funding

This study did not receive any external funding. All expenses were covered by the authors.

Ethical Considerations

The study followed ethical guidelines for educational research. Participation in surveys and interviews was voluntary, and informed consent was obtained from all participants. No sensitive personal data were collected, and confidentiality was strictly maintained.

Keywords English as a Medium of Instruction (EMI); Algerian higher education; Teacher training; Language policy; Pedagogical challenges; Teacher perceptions.

Abstract

The adoption of English as a Medium of Instruction (EMI) has emerged as a global trend in higher education, particularly in non-English speaking countries seeking greater academic visibility, student mobility, and international collaboration. Algeria, as part of this global shift, has recently introduced policies encouraging universities to gradually implement EMI across various disciplines. In response, the Ecole Normale Supérieure Constantine (ENSC) initiated a specialized training programme in 2022–2023 to equip university teachers with the linguistic and pedagogical skills necessary to deliver their courses in English.

This study investigates Algerian teachers' perceptions of EMI preparation, focusing on the challenges encountered during training and their expectations for future practice. Data were collected through a structured questionnaire administered to a representative sample of teachers enrolled in the ENSC training programme.

Findings reveal a strong willingness among teachers to embrace EMI due to its professional advantages, including enhanced career opportunities, access to international research networks, and alignment with global academic standards. However, significant challenges were reported, including insufficient prior English proficiency, lack of tailored pedagogical materials, and limited institutional support structures. Teachers also expressed concerns about balancing disciplinary expertise with language development, as well as the risk of compromising content quality during the transition phase.

This research highlights the critical need for a systematic and long-term EMI policy framework in Algeria that combines language training, content-based pedagogy, and institutional incentives. Practical recommendations include the design of context-specific teacher development programmes, integration of English for Academic Purposes (EAP) modules, and sustained institutional backing. The study contributes to regional and international debates on EMI by offering insights into the Algerian context, where the adoption of English represents both a strategic necessity and a pedagogical challenge.

Introduction

Due to its importance as a global language, using the English language as a medium of instruction in non-English speaking countries has become a popular trend. Because of this, there is a growing demand for content teachers who are proficient in English and who can deliver their courses in this language. Nevertheless, not all content teachers in non-English speaking countries possess sufficient proficiency and the necessary pedagogical skill that enable them to use English as a medium of instruction (EMI). It was necessary, therefore, to develop training programmes to help content teachers in this quest. Algeria is one of the many countries concerned, as the demand for content teachers who can deliver their lessons in English has considerably grown. To help them develop their English proficiency and pedagogical skills so as to use EMI, English language training programmes have been developed. For content subject teachers, however, these programmes pose a variety of difficulties. Many of them, especially those with low proficiency level in English, are wondering if they would be able to deliver their subjects in that language after a limited period of instruction. This paper aims to explore the challenges content teachers in Algeria may face when being trained to use English, with an emphasis on the Ecole Normale Supérieure Assia Djebar – Constantine training programme and eventually to gather suggestions that would help make this operation a success.

1. Efforts to Develop English Language Training Programmes in Algeria

The English language has gained a worldwide predominance and is being perceived as a gate that opens global success opportunities for people who master it. Algerian language practitioners, well aware of the importance of the role played by this language in promoting the quality of education since it is recognized as the language of science and technology (Belmihoub, 2018), have given it due consideration. Many conditions have contributed to its promotion in Algeria, namely the support it has received by the British Council and the American Embassy. Because of the British Council's promotion of the language, which is well-known for coordinating ELT across the globe, English has expanded greatly in Algeria in the same manner it has in other parts of the world (Pennycook, 2016). Also, as a result of the country's growing international business and economic relations with the UK and the USA, the British Council and the American Embassy have greatly extended their sponsorship of language courses and cultural events in Algeria (Belmihoub, 2018). Many training programmes have been offered by these two organizations since the early 1980's to foster the English language skills of both learners and teachers.

2. English in Algerian Higher Education

Concerned with a desire to confer an international dimension to higher education, the Algerian Ministry of Higher Education and Scientific Research has deemed the enhancement of the use of the English language among Algerian higher education institutions a strategic priority. The expressed motive underlying this initiative was to align Algerian universities with global academic standards and promote their competitiveness within the international educational and research communities. In a press conference on the promotion of higher education and scientific research in 2019, the Minister of Higher Education addressed university students in English (*Maghreb Voices, 2019*) and that was a premiere in Algerian history. This marked a significant shift in Algeria's linguistic policy in higher education, traditionally dominated by Arabic and French. In his subsequent communications with the Algerian university community about educational reforms, the Minister used Arabic and English instead of French which used to be predominantly employed by Algerian political figures interchangeably with Arabic. Later in 2019, a national poll was conducted by the Ministry via its website to gauge higher education teachers and students' opinion on the use of English as a medium of instruction. As the results obtained were massively in favor of this initiative, the Algerian Ministry of Higher Education and Scientific Research was prompted to pass policies that promoted English language teaching and gradually integrated it into administrative an academic practice. The policy underlying this initiative required that English, instead of French, be used alongside with Arabic to vehicle any official administrative communication among higher education institutions. As a consequence, official websites of all Algerian universities were updated and began to display their content in English, in addition to Arabic and French.

The Algerian efforts are consistent with worldwide trends which are increasingly considering English as an indispensable tool to access scientific knowledge, collaborate with international peers, and increase employment opportunities. In this respect, Macaro, Curle, Pun, An and Dearden (2018) claim that adopting EMI makes it possible to access global academic resources and to promote students' linguistic and cognitive abilities.

In addition, the adoption of English in Algerian higher education reflects a broader geopolitical and sociolinguistic transition. Accordingly, Benrabah (2020) contends that the promotion of English in Algeria reflects a national effort to modernize the Algerian educational system and at the same time minimize dependence on the French language. Furthermore, Algerian policymakers want to promote the English language to reinforce links with the world's academic community and diversify both students and teachers' linguistic competencies.

3. Benefits of Using EMI

Using EMI has a number of potential benefits, hence the necessity of training higher education teachers to use this language to deliver their courses. Improving the quality of education is one of these benefits as EMI opens access to a large range of knowledge and resources such as academic literature, research, and scholarship (Airey and Linder, 2008). Preparing students for the global workforce is another benefit. Students who master English in addition to intercultural skills are likely to succeed in international contexts because EMI makes it possible for students, as well as teachers, to be in contact with colleagues from other cultures and to develop intercultural competence (Macaro, 2018). Students and teachers from different parts of the world are also offered opportunities for cross-cultural exchange and collaboration thanks to the promotion of internationalization by EMI (Doiz, Lasagabaster and Sierra, 2011). Universities which offer courses in English can attract international teachers and students and by the same token, promote their visibility, international reputation and competitiveness (Jenkins, 2013). Another benefit is that the exposure to authentic and challenging language use through EMI leads both teachers and students to better their English language proficiency (Lasagabaster and Sierra, 2009). Research by some scholars such as (Kirkpatrick, 2012) has also demonstrated that, compared to those who are taught subjects in their native language, students who are instructed through English achieve better academic results.

4. Impact of Language Proficiency on the Effectiveness of EMI

The development of the English language proficiency is one of the major goals of training content subjects teachers to use English. Language proficiency is not only a necessary condition for successful communication in contexts where EMI is used, but it also significantly influences the way in which teachers deliver content and engage their students effectively. In this respect, many studies have attempted to investigate the effect of language proficiency effectiveness of EMI. Brutt-Griffler and Samimy (1999), for example, claim that if teachers want to effectively deliver their courses in English, it is mandatory to have a high level of English proficiency. Another research by Kim and Kim (2018) concluded that content teachers need to have a high English proficiency levels in order to be more confident and effective in teaching their subjects in English. The authors emphasize that teachers' ability to create an interactive and engaging classroom environment is directly impacted by their linguistic competence. Another major aspect of training content teachers to use English is to promote their pedagogical skills in using that language as a medium of instruction. English language programmes often aim at training teachers to employ techniques and strategies that improve linguistic and pedagogical skills to face challenges encountered in EMI. In Spain, for example, Morell, Aleson-Carbonell, and Escabias-Lloret (2023) designed a comprehensive EMI training programme for content teachers at a Spanish university focusing on digital competencies, linguistic proficiency and pedagogical strategies to empower them with effective pedagogical skills in using English to teach their subjects. Workshops on effective teaching strategies, language development, and content delivery constituted the core of this programme, showing a holistic approach to EMI teacher training. The significance of language proficiency was also highlighted by Dearden (2014) who argued that insufficient language skills among content teachers is an important obstacle that faces the worldwide rapidly expanding EMI. The study emphasized that teacher training programmes should give priority to the development of language proficiency in any endeavor at EMI preparation. Likewise, Klaassen (2001) carried out a study that investigated the implementation of EMI inengineering education in the Netherlands and obtained results that emphasized the important role of teachers' English language proficiency. The study concluded that higher proficiency levels significantly improved both the quality of instruction and the teachers' ability to adapt

their teaching methodologies to suit non-English speaking students. In the same vein and in their attempt to systematically review EMI research, Macaro et. al. (2018) found that language proficiency plays a significant role in fostering teachers' confidence and their ability to manage classroom interactions effectively. According to this study, a successful EMI implementation demands both high linguistic proficiency levels and continuous professional development to refine teaching techniques and strategies. All these findings converge with the idea that language proficiency and pedagogical effectiveness in EMI contexts are closely related. Therefore, the integration of language proficiency development in teacher training programmes imposes itself as a necessity when any institution worldwide attempts to implement EMI.

5. Potential Challenges Faced by Algerian University Teachers

Although training university teachers to use EMI has numerous advantages, there are also many potential challenges related to both teachers and students' linguistic proficiency, availability of resources and institutions' readiness to endorse EMI practices. Research on the challenges faced by content subject teachers using EMI worldwide emphasize a number of substantial issues that may affect the success of the teaching/learning process and that may represent potential concerns for Algerian content subject teachers too. Indeed, university teachers may lack the fluency in the language needed to instruct students in English successfully. This is likely to create lack of understanding, miscommunication, and other issues (Jenkins, 2013). The challenges faced by teachers in implementing EMI, particularly lack of institutional support and resources, have been reported in different contexts. For instance, Pun and Thomas (2020) conducted a study focusing on secondary school EMI science teachers in Hong Kong. They identified several issues, including limited English communication skills and lack of EMI training. The study concluded that in order to enhance the quality of EMI programmes, effective support systems for EMI teachers should be guaranteed. Similarly, Macaro, Akincioglu and Han (2020) surveyed EMI teachers across multiple countries, including China, Italy, Japan, Mexico, Spain, and Turkey. Their findings revealed that many EMI teachers were assigned to teach without adequate preparation, highlighting the necessity for comprehensive teacher professional development programmes to support EMI implementation.

Still another challenge is some university teachers' resistance to change. According to Macaro (2018), teachers may perceive the use of another language to teach their subjects as a threat to their identity and to the tradition of teaching in their native language. Resistance to learn in English can even be felt by students, especially if they are not familiar with using English. This can negatively affect their learning outcomes and engender communication breakdowns. Also, as not all students have the same proficiency level in English, EMI can result in educational inequality. Contrary to English speaking students or those with a high proficiency level, students with a low proficiency level in this language may have considerable difficulty to grasp the content and thus be at a disadvantage (Lasagabaster and Sierra, 2009).

In the Algerian context, many studies have been carried out by researchers investigating the difficulties Algerian content teachers are encountering when using EMI. In a survey that collected data from 327 content subject university teachers, Hamane (2023) noted that while they recognise the potential benefits of using EMI, teachers are conscious of the many obstacles too. The latter include:

'language barriers and the comprehension of complex concepts, effective communication between teachers and students in English, the potential impact on student performance, the student's ability to comprehend the language, the potential increase in workload and stress, the scarcity of qualified teachers proficient in English, the potential exclusion of non-English-speaking students, the influence of language on students' confidence and participation, student frustration, and motivation' (Hamane, 531: 2023).

Similarly, using a thirty-one questions survey with thirty-two university educators from three different universities in western Algeria, Menezla and Benghalem (2024) pointed to some issues faced by Algerian university instructors in implementing EMI, namely the linguistic and pedagogical barriers, lack of confidence in teaching in English, the inadequacy of instructional resources, communication difficulties in their classrooms and lack of specialized training in delivering content in English. Ouarniki (2023), on the other hand, adopted a qualitative approach, using semi-structured interviews with ten Algerian teachers, belonging to different universities and fields of specialism. She concluded that the success of EMI in Algerian higher education will highly depend on addressing a set of obstacles including the availability of resources, the quality of training and support provided to teachers, and the willingness of all stakeholders to embrace the changes required. In a related context, Maraf and

Zekri (2023) invstigated the issue of student-teachers' abstention from attending the English training programme at the Centre d'Enseignement Intensif des Langues (CEIL) in Tlemcen and Biskra universities by means of semi-structured interviews with six student-teachers and unstructured interviews with three teachers. The researchers deduced that student-teachers abstain from attending English language classes due to mainly the inconvenience scheduling of the language classes, the proficiency level of the student-teachers, their placement in language classes and their negative attitudes towards the training program and the EMI reform. The findings of the study imply that there would be jeopardy to the success of English-blended instruction in Algerian universities.

All these studies have concluded that the majority of Algerian content teachers lacked the pedagogical knowledge and English language ability needed to teach their topics in English. They call for the necessity that training programmes assist Algerian content teachers in improving their pedagogical and English language abilities. In order to successfully teach their subjects in English, teachers need not only English language proficiency, but also specific pedagogical skills such as knowing how to effectively design and use appropriate materials, assess their students' learning, and promote successful classroom interaction.

6. Methodology

The present study is exploratory in nature, and it involves a mixed-methods design with the aim of delving into teachers' experiences with the English language and shedding light on the challenges they may face during their training in English in preparation to use it as a medium of instruction.

6.1. Research questions

1) What are teachers 'perceptions of their lacks?

2) What are teachers' perceptions of the challenges they might face when using EMI?

3) How to cater for these challenges?

6.2. Background Information about Participants

Before the training was launched, 151 teachers belonging to 8 departments took a placement test that aimed at identifying their proficiency level and placing them in instructional groups accordingly, but only 113 teachers embarked on the English language training. The results obtained by the teachers in the placement test could place them in the following proficiency levels:

Proficiency Level	Number of teachers	Percentage
A1	74	49
A2	33	21.85
B1	34	22.51
B2	09	5.96
C1	01	0.66
C2	00	00
Total	**151**	**99.98%**

Table1: Teachers' English Proficiency Level after the Placement Test

The results displayed in the table above show that half of the teachers have a beginner proficiency level in English. According to the Common European Framework of Reference for Languages (Introductory Guide to the Common European Framework of Reference (CEFR) for English Language Teachers (2013)), people who have this level are able to use and understand familiar everyday expressions and very basic phrases, introduce themselves and others and ask and answer questions about personal information. Other 21.85% of the teachers have an A2 proficiency level which means, according to the same framework, that they can comprehend sentences and use expressions related to relevant information such as basic personal and family information, shopping and local geography. They can also communicate in simple routine tasks that require a simple and direct exchange of information. In addition, 22.51% have a B1 proficiency level, that is, they can understand the main points of a clear standard input. They can produce simple connected texts on familiar and personally relevant topics. They can also describe different experiences and events and give reasons and explanations for opinions. 5.96% (9 teachers) among the whole sample have a B2 proficiency level which denotes their ability to understand the main ideas of a complex text including technical discussions in their field of specialization. They can interact with some degree of fluency and spontaneity, produce clear and detailed text on a wide range of topics and explain a viewpoint on a topical issue. It has to be mentioned at this point that the training aims at leading teachers to achieving a B2 proficiency level and since 9 teachers already had this level, they were not concerned with the training. However, 4 of them were intrinsically motivated to learn English and they decided to pursue the training for the sake of reinforcing their competence. Finally, only one teacher representing 0.66% of the teachers receiving the placement test has a C1 proficiency level. She can understand a wide range of demanding, longer texts and express herself with a relative fluency and spontaneity. She can also use language flexibly and effectively for various purposes and can produce clear, well-structured and detailed texts on complex subjects. However, she decided to go through the training driven by her intrinsic motivation to learn English. As shown in the table, none of the teachers has complete mastery over the English language as 0% of them have C2 level.

6.3. Participants

The population with which this study is concerned is non-English language teachers at the Ecole Normale Supérieure Assia Djebar, Constantine who are required to take a training in English. Using a Simple Random Sampling, a number of 54 teachers representing 47.87%of the ones who received the training in English (n = 113) was selected to complete a mixed-methods questionnaire. Their fields of specialty are Physics and Chemistry, Natural Sciences, Computer Science, Exact Sciences, Arabic Language and Literature, French, History and Geography and Philosophy.

6.4. The Questionnaire

To gather data from the participants, a mixed-methods questionnaire was designed and administered to teachers at the beginning of the English language training. Its main objective is to gather insights into their perceptions of potential challenges and benefits of EMI.To avoid possible misunderstanding, the questionnaire items were written in English; and to make teachers feel at ease answering them, the researchers decided to write them in French. In addition, since it has a well-narrowed objective, and in order to make the teachers answer it seriously without fear of causing them to feel bored, tired or inhibited by its length, the questionnaire included just8 items, and only two of them (Q 6, 7) are open-ended while the six others (Q 1, 2, 3, 4, 5, 8) are close-ended requiring teachersto merelytick the appropriate answer.

Question 1: How many years have you been teaching in higher education?

Teaching Experience	N°	%
Less than 5 years	13	24.1%
5-10 years	10	18.5%
10-15 years	24	44.4%

More than 15 years	**7**	**13%**
Total	**54**	**100%**

Table 2: Teachers' Teaching Experiences

As table 2 shows, 13 teachers have less than 5 years teaching experience, 10 teachers have between 5 and 10 years' experience, 24 teachers have between 10 and 15 years' experience and 7 teachers have more than 15 years' experience.

Question 2: What is your primary language of instruction?

Language	N°	%
Arabic	**43**	**79.6%**
French	**11**	**20.4%**
English	**00**	**00%**
Total	**54**	**100%**

Table 3: Teachers' Primary Language of Instruction

None of the respondents teaches in English and this is understandable since the training is devoted for teachers of other subjects than English. So the majority of the respondents to the questionnaire teach their subjects in Arabic (43 teachers) and in French (11 teachers). Arabic is used as a medium of instruction in the departments of Arabic Language and Literature, History and Geography and Philosophy while French is used in the department of French. The language that is officially used in the departments of Physics and Chemistry, Natural Sciences, Computer Science and Exact Sciences is Arabic though French can alternatively also be used. English is expected to be used as a medium of instruction in this last category of departments following the English language training.

Question 3: Which department are you affiliated with?

Department	N°	%
Arabic Language and Literature	5	9.3%
History and Geography	6	11.1%
Philosophy	00	00%
French	11	20.4%
Physics and Chemistry	8	14.8%
Natural Sciences	8	14.8%
Computer Science	6	11.1%
Exact Sciences	10	18.5%
Total	**54**	**100%**

Table 4: Teachers' Fields of Specialty

This question enquires about the departments with which the respondents to the questionnaire are affiliated. Among them, 5 teachers are affiliated with the department of Arabic Language and Literature, 6 teachers with the department of History and Geography, 00 teachers with the department of Philosophy, 11 teachers with the department of French, 8 teachers with the department of Physics and Chemistry, 8 teachers with the department of Natural Sciences, 6 teachers with the department of Computer Science, and 10 teachers with the department of Exact Sciences.

Question 4: How would you rate your English proficiency level?

Proficiency Level	N°	%
Beginner	37	68.5%
Intermediate	17	31.5%
Advanced	00	00%
Total	54	100%

Table 4: Teachers' Perception of their English Proficiency Level

The majority of the teachers (37) think that their English proficiency level is beginner, while 17 of them think that is it intermediate. None of the respondents thinks s/he has an advanced level. This may significantly affect the training and the teachers' ability to use EMI because an adequate proficiency level is an important condition for the success of any EMI programme.

Question 5: How do you feel about the prospect of using English as a medium of instruction?

Teachers' feelings	N°	%
Very comfortable	6	11.1%
Comfortable	11	20.4%
Somewhat comfortable	5	9.3%
Uncomfortable	22	59.3%
Very uncomfortable	10	18.5%
Total	54	100%

Table 5: Teachers' Attitudes Towards EMI Use

The responses to this question have shown that the majority of teachers feel either uncomfortable (22) or very uncomfortable (10) with the prospect of using English as a medium of instruction. Drawing on the results of question 4 where 37 teachers have declared that they have a beginner proficiency level in English, this attitude may be due to the fact that these teachers are not sufficiently proficient in English, especially in what regards academic and technical vocabulary. Many of them may find it challenging to fluently use this foreign language in complex and specialized discussions and to explain nuanced concepts in technical or scientific subjects that require precise terminology. When they are required to teach their subjects in English, these teachers are likely to need more time to prepare, translate or review materials, prepare notes and face anticipated linguistic difficulties. This can create additional workload and stress. Their discomfort may lead them to rely on references

in Arabic or French which results on non-authentic EMI. All this may engender emotional strain that is likely to discourage teachers from fully adopting EMI.

The rest of the respondents feel either very comfortable, (6), comfortable (11) or somewhat comfortable (5) with using English to teach their subjects. They are likely to belong to the category of teachers who have a B1, B2 and C1 proficiency levels in English. They eitherfeel highly confident using English for teaching with minimal linguistic barriers, may occasionally encounter minor language difficulties, or may struggle with specific language aspects or technical terms.

Question 6: When expected to use English as a medium of instruction, which areas of English language proficiency do you think you will find challenging?

This open-ended question gives the teachers an opportunity to express themselves openly in relation to areas they think they will struggle with when they have to use English to deliver their lessons. Teachers' answers were analyzed and grouped according to common themes. The majority of teachers (49 teachers, 90.7%) have agreed that the major challenge they will face is **lack of fluency in spoken English**. They apprehend the prospect of facing difficulties to fluently speak in English while delivering their lectures, especially whenthey have to explain a complex concept or when they have to answer unexpected students' questions. They have also expressed concerns related to **pronunciation difficulties** that would prevent them from ensuring that their speech is comprehensible enough for their students to understand. They find many words difficult to pronounce and they are worried about mispronouncing technical terms. In addition to lack of fluency in spoken English, almost the same teachers (41 teachers, 75.9%) have expressed challenges related to **listening comprehension**. They find difficulties to understand English when they participate in international conferences, when they watch educational videos or listen to audio materials that they would want to use in teaching in the future. These challenges can be explained by lack of practice in spontaneous speaking and listening and they suggest necessity of adequate training that gives teachers sufficient opportunities to use English in speaking and be exposed to it in listening.

An important number of teachers (37 teachers, 68.5%) have also referred to **lack of confidence in teaching complex concepts** as the major difficulty they anticipate when using EMI. They believe that teaching abstract and complex concepts in a language that they do not master is intimidating. They are afraid of confusing their students because they cannot express themselves as precisely as they can in Arabic or French. This lack of confidence is due to lack in English language proficiency which can be overcome by an adequate training and more practice opportunities.

Thirty (30) teachers (55.6%) have declared that grammar and sentence structure are the major challenge they anticipate when using EMI. Their **lack of mastery of the English language structure** will prevent them from using correct grammar and structuring their sentences properly in English. They think that they will frequently find refuge in translating from Arabic or French, therefore making their speech less effective and awkward. Indeed, translating thoughts across languages may lead to grammatical errors and unnatural sentence structures.

Less teachers (17 teachers, 31.5%) have referred to challenges related to **academic vocabulary and technical terminology** specific to their subject area. Some of them have explained that many of the terms used in their fields are complex, and they often find difficulties to think of equivalent expressions in English that convey similar meanings to those used in Arabic or French. This is likely due to lack of exposure to subject-specific English vocabulary, which does not just require the ability to understand terminology but also to explain it clearly to students. However, the fact that only 17 teachers suffer from this difficulty may suggest that the rest of the teachers do not have particular problems related to technical terminology as most of it is close to that used in French. This may particularly be true for those who partly deliver their lectures in French.

Question 7: What pedagogical challenges do you anticipate in teaching your subject in English?

This question is open to teachers' answers to collect from them all the possible challenges they expect when using EMI. It was mostly answered by teachers affiliated with the departments of Physics and Chemistry, Natural Sciences, Computer Science, and Exact Sciences (32 teachers, 59.3%) probably because they feel that they are the ones directly concerned with using EMI in their courses. The answers they had provided were collected, synthesized and grouped according to common concerns among teachers.

Eleven (11) teachers have mentioned challenges related to **language barriers**. They are concerned that they do not possess a sufficiently high English proficiency to effectively communicate with their students and convey their ideas to them in English. This is quite understandable knowing that 37 teachers among the respondents to the questionnaire have already declared that they possess a beginner level in English (Q4). Another group consisting of 9 teachers (16.7%) are concerned about **students' readiness** to receive instruction of their scientific or technical subjects in English. They are afraid that their students may not possess a sufficient English proficiency to understand content or participate effectively in class. One teacher has even claimed that their students have sometimes difficulties to assimilate complex scientific concepts when they are taught in Arabic, and the difficulty would certainly be doubled if these concepts are taught in English. So the combined teachers' and students' lack of proficiency would make it a hard task to teach content in English. Seven teachers (13%), think that **time constraints** would be a challenge when using EMI. They are worried that they would not have sufficient time to prepare their lessons and deliver them in English. Given their many other responsibilities as teachers, they think that the additional chore of preparing lessons in English would overburden them. Four teachers (7.4%) referred to **pedagogical challenges** as their major concern. They are not sure how to possibly adapt their teaching style to EMI situations or how to incorporate their English language learning outcomes into the subject content they would be delivering to their students. Finally, one teacher (1.9%) expressed worries about potential **lack of resources or materials in English** to effectively teach their subject. It might be claimed, however, that this worry is unfounded since English is nowadays known to be the language of academia with the vast majority of scientific publications and research articles published in English.

Question 8: In your opinion, what are the primary benefits of teaching your subject in English? (Check all that apply)

1. Enhances students' English proficiency
2. Prepares students for global opportunities
3. Increases access to international resources
4. Other (please specify):

Benefits	N°	%
Enhances students' English proficiency	31	100%
Prepares students for global opportunities	54	100%
Increases access to international resources	54	57.4%
Other (please specify):		

Table 6: Teachers' Perception of Benefits of EMI

The respondents to the questionnaire have unanimously agreed that the use of English in teaching their subjects **increases access to international resources** and **prepares students for global opportunities**. Their opinions strongly align with the goals of EMI highlighting their recognition of the value that it can add both to the quality of the teaching materials and resources and to the future academic and professional prospects of the students. English is the dominant language of scientific publications and by using EMI, teachers have access to a wider array of resources and materials that are not available in their native language. Thus, both teachers and students are kept informed about the latest advancements in their fields.

Teachers are aware that English proficiency has become a requirement in the job market of today's global world. Students who receive instruction in English and are equipped with this language skill are very likely to attract international employers in various fields from technology to business and are able to effectively compete in a global workforce. English proficiency also enables them to pursue advanced studies and research opportunities in countries where English is the predominant language of instruction and publication. By fostering English

language skills, teachers will increase their students' eligibility for scholarships, graduate programmes and research opportunities at international universities. Consequently, EMI is also of paramount of importance in ***enhancing the students' English proficiency*** (this option was selected by 31 teachers).

When asked to add other benefits of EMI, 37 teachers (57.4%) have given answers that were synthesized and combined together according to their common themes giving way to five broad answers. Seventeen (17) teachers have declared that EMI improves their **careeropportunies** since teaching in English can enhance their professional skills and empower them to become more competitive in the job market. Other 11 teachers have claimed that EMI helps them to have **better communication** with international students and colleagues as teaching in English can make cross-cultural exchange and collaboration easier. Nine (9) teachers have suggested that using English to teach their subjects offers them opportunities to be constantly exposed to English language and culture, leading them to enhancing their language skills and enlarging their cultural knowledge.

6.5. Discussion of the Findings

The analysis of the questionnaire has made it possible to highlight some insights into teachers' perceptions, challenges and expectations related to the use of EMI at the Ecole Normale Supérieure of Constantine. These findings help us gain understanding of the teachers' readiness or reticence towards the English trainingprogramme and EMI potential benefits. They also enable us to obtain specific information which allow us to answer the first research question related to the teachers' perception of their lacks. The fact that the majority of teachers (68.5%) consider that they have an elementary English proficiency level accounts for the discomfort they feel towards the prospect of using English to teach their subjects (59.3% feel "uncomfortable" or "very uncomfortable"). This clearly reveals a considerable gap in their English language skills. The most commonly reported challenges faced by teachers are speaking fluency (90.7%), listening comprehension (75.9%), confidence in teaching complex concepts (68.5%) and grammar issues (55.6%). The findings, thus, suggest that a successful implementation of EMI heavily relies on good language proficiency. Brutt-Griffler and Samimy (1999) and Kim et al. (2018) both stress that high levels of English proficiency are essential for teachers to effectively deliver content and manage classroom interactions. The present study confirmed this when it demonstrated that teachers with higher English proficiency levels were more confident towards the prospect of using EMI. This, in turn, corroborates the conclusions of Dearden (2014) and Macaro et al. (2018), who argued that linguistic competence directly impacts the quality of instruction. The research also highlights the importance of adopting continuous professional development in enhancing teachers' pedagogical strategies and teaching techniques. This closely aligns with the comprehensive EMI training programme developed by Morell et al. (2023), which emphasized the integration of digital competencies and pedagogical strategies. The study found that training programmes that focus on the development of both teaching skills and language proficiency greatly contribute to the effectiveness of EMI.

Furthermore, teachers' concern about students' readiness and English proficiency level (16.7%) adds extra weight to their challenges requiring a parallel need to prepare both teachers and students for EMI. Students preparation involves the introduction of English language courses tailored to their academic fields. Indeed, as Lasagabaster & Sierra (2009) claimed, students with a low English proficiency level may have difficulty to grasp content contrary to their counterparts with a high proficiency level, leading to inequalities among them. This will also create communication breakdowns between teachers and students, hence the necessity of combining teacher training with student training to enhance their English proficiency.

Institutional support, in the form of additional training time, materials and workshops on EMI pedagogy, is also necessary as time constraints (13%) and adapting teaching style (7.4%) have also been raised by some teachers. In this respect, Pun and Thomas (2020), argued that the lack of institutional backup in the form of training, materials, and technological infrastructure constitutes a barrier to the effective implementation of EMI in many institutions. These findings have enabled us to obtain information to answer the second research question related to the teachers' perceptions of the hypothetical challenges they might face when using EMI. However, despite the difficulties expressed by teachers, they unanimously recognized the benefits of EMI in opening global opportunities for students (100%), enhancing their English proficiency level (57.4%) and increasing access to international resources (100%). This implies that policy makers should prioritize EMI as a strategic goal to align with global academic standards. Efforts to implement EMI should also be regarded as an investment in the country's long-term academic and economic competitiveness.

6.6. Pedagogical and Logistical Suggestions

Enhancing teachers' training to successfully use EMI is crucial to guarantee that both instructors and students can succeed in an increasingly globalized educational environment. In the light of the findings of the present study, some suggestions to improve EMI training and encourage more successful EMI in the Algerian tertiary context - and by the same token answer the third research question related to how to cater for these challenges- are provided. As language proficiency and fluency inevitably affect the teaching efficacy in EMI classes, it is essential to construct a comprehensive language training programme. Its aim is to equip teachers with the necessary linguistic tools required for EMI as well as workshops on effective EMI pedagogical strategies that enable teachers to simplify language without losing content depth. The long-term success of the programme is very likely to be affected if adequate training is not adopted. Hence, it would be helpful if institutions provide teachers with language support resources such as English tutoring, access to translation tools or mentorship programmes delivered by proficient teachers of English to foster teachers' confidence and language skills. On the other hand, mastering English language skills solely may not lead to using it successfully in EMI contexts. Thus, it is necessary to combine English language training with specific pedagogical skills such as knowing how to effectively design and use appropriate materials, assess their students' learning, and promote successful classroom interaction. Eventually, teachers will be able to adjust their teaching methods to comprise both the content and the language requirements. Indeed, a combination of English language instruction with pedagogical training would likely result in teachers' higher levels of confidence in their ability to teach their subjects in English.

Conclusion

As English as a medium of instruction (EMI) is growing in vogue, not only in Algeria but in different parts of the world, significant shifts in higher education are made reflecting global trends that emphasize the need for multilingual competency. Nonetheless, as shown in the present study, the adoption of EMI presents significant challenges for teachers, especially those with a low English proficiency level. The results obtained from both the placement test and the questionnaire analysis have indicated that teachers do have a quite limited English language proficiency level and many of them do in fact have difficulties to speak fluently, to understand spoken English and to teach complex notions related to their subjects in English. These challenges necessitate comprehensive teacher training programmes that enable teachers not only to develop their English proficiency but also offer them pedagogical assistance to help them adjust their teaching techniques to suit EMI environments. However, in spite of these challenges, all teachers are well aware of the benefits of EMI, namely increased global scientific and academic opportunities for students, enhanced English proficiency and access to global academic resources. These benefits imply that given adequate institutional support, including sufficient training time and resources, the transition to EMI can be a real success. To guarantee that the Algerian higher education system can fully embrace this shift, it is essential for policymakers to prioritize continued professional development for teachers and to integrate EMI into the broader educational framework. In doing so, Algeria can align its universities with global academic standards and provide its students with the necessary tools to prosper in a rapidly globalizing world.

Findings

1. Motivation and Awareness
- The majority of teachers demonstrated high motivation to learn English, perceiving EMI as vital for academic and professional advancement.
- Teachers linked EMI to enhanced global research opportunities and student competitiveness.
2. Challenges Reported
- Limited initial English proficiency created difficulties in following training modules.
- Lack of access to adequate teaching resources and pedagogical models hindered effective training.
- Concerns emerged about potential declines in content quality if courses are taught in English prematurely.
3. Institutional and Structural Gaps
- Teachers emphasized the absence of systematic policy guidance and follow-up mechanisms.
- Institutional support in terms of mentoring, workload adjustment, and financial incentives was perceived as insufficient.
4. Prospects for Improvement
- Participants recommended gradual implementation of EMI, beginning with pilot modules before full-scale

adoption.
- Teachers called for long-term investment in language training, peer collaboration, and partnerships with international institutions.

Acknowledgment

The authors would like to express their gratitude to the administration of the Ecole Normale Supérieure Assia Djebar, Constantine, for their support in facilitating this study. Special thanks are extended to the participating teachers for their valuable insights and cooperation throughout the research process.

Funding

This research did not receive any specific grant from funding agencies in the public, commercial, or not-for-profit sectors.

Conflict of Interest

The authors declare that they have no known competing financial interests or personal relationships that could have appeared to influence the work reported in this paper.

Ethical Considerations

The study was conducted in full compliance with research ethics principles. Participation was voluntary, and informed consent was obtained from all participants prior to the administration of questionnaires. The data collected were kept confidential and used exclusively for academic research purposes. Approval for the research design was obtained from the Research Ethics Committee of the Ecole Normale Supérieure Assia Djebar, Constantine.

Keywords Curriculum innovation; Energy-based teaching approach; Chemistry education; Student achievement; Middle school education; Algeria.

Abstract

This study examines the effectiveness of a chemistry teaching programme structured around the concept of energy as a unifying approach in Algerian middle education. Energy, as a central scientific concept, provides a cross-cutting framework that connects chemical processes, physical phenomena, and real-life applications. Despite its centrality, the Algerian middle school chemistry curriculum has traditionally introduced energy in a fragmented manner, limiting students' capacity to establish meaningful conceptual connections across topics.

The primary aim of this research was to design, implement, and evaluate a curriculum that integrates energy as a guiding principle for teaching chemistry to first- and second-year middle school students. The study employed an experimental design involving 150 students (male and female) drawn from different schools in Algiers. The experimental group received instruction using the energy-based curriculum, supported by specially designed teaching cards, a teacher's guide, and tailored achievement tests. The control group continued with the conventional curriculum.

Quantitative data were analysed using statistical tests at a 0.01 significance level. Results indicated that the experimental group outperformed the control group in achievement tests, demonstrating that the energy-based approach had a significant positive effect on learning outcomes. Furthermore, a strong positive correlation was found between students' achievement and their exposure to the new curriculum. These findings underscore the pedagogical value of employing energy as an integrative concept in chemistry teaching.

The study concludes by recommending the gradual inclusion of energy-based units into national chemistry curricula, extending the pilot programme to diverse geographical and socio-cultural contexts in Algeria, and providing systematic teacher training. Such initiatives could strengthen students' conceptual understanding, scientific literacy, and readiness for higher levels of scientific study.

Introduction:

The teaching of sciences aims at understanding three parts: knowledge, skills, and attitudes. The main objective of science teaching is to provide students with experiences that help them become scientifically literate, as the modern

view of science learning includes mathematics, natural sciences, and technology in addition to social sciences. This objective involves placing students in the first rank among the world's nations in achievement in science and mathematics. In modern sciences, students are prepared to participate in civic life, to be productive workers and lifelong learners, as this vision adopts the idea that students will be loyal citizens striving to establish a strong democracy that supports the nation's economy and maintains an advanced position in science and technology. The modern vision of science learning directs us to the philosophy of "less is more," meaning the trend is towards teaching fewer topics while achieving more hands-on work and deeper learning (Al-Huwaidi, 2010, p. 43).

Chemistry is one of the subjects that students should study during their science education, as it relies on the experimental research method, enabling students to acquire skills specific to this method. Chemistry is connected to their daily lives, helping them solve everyday problems, providing them with cognitive skills to interpret some surrounding phenomena, manual skills, and fostering positive attitudes towards science and scientists.

The content of science for the preparatory stage, as approved by the National Academy of Sciences (NAS) in the United States, is classified into seven main topics (known as the national standards for middle school science content), namely: standards of developing and understanding scientific inquiry, standards of physical and chemical sciences, standards of life and environmental sciences, standards of earth and space sciences, standards of science and technology, standards of science from a personal and social perspective, and standards of the history and nature of science. Students at this stage study three main topics in physics and chemistry:

First topic: Properties of matter and the changes that occur to these properties, which include the following standards: density, boiling point, solubility, separation of mixture components. Materials react chemically in various ways to form compounds with completely different properties. Elements react together in multiple ways to form compounds that explain the existence of living and non-living materials encountered.

Second topic: Motions and the forces causing them.

Third topic: Transfer of energy, which includes the following standards: energy is related to heat, light, motion, mechanics, sound, nucleus, and the nature of chemical matter. Energy can be transformed in various ways. Energy is transferred in multiple ways. Nuclear or chemical energy can be transferred inside or outside a given system (Al-Najdi & others, 2005, pp. 61–62).

Chemistry is taught in middle education in Algeria as one of the fields of physical sciences and technology, called: The Field of Matter and its Transformations. The focus is on teaching the microscopic structure of matter and explaining all physical and chemical changes using models, i.e., the chosen teaching approach is: the structure of matter.

It has been observed that students at this age do not comprehend these models as they are not connected to their lives. It would have been more appropriate first to acquaint students with the surrounding chemical materials, describe them, know their properties, the reactions of these materials with one another, and how to benefit from these reactions if possible, then move to microscopic interpretation. We agree with Henry (1976, p. 339) that students need from the start to understand: (a) what they see happening in test tubes, beakers, and flasks; (b) the energy changes that accompany matter changes; (c) the molecular or ionic structure of the materials involved in (a) and (b), and how these help us understand (a) and (b).

For this reason, we proposed another approach to teaching chemistry in middle education: energy. Energy is considered one of the unifying ideas in science teaching. Among the key concepts that should be taught in science in middle school, Pierre (2010, p. 18) mentioned the following: energy transforms in some changes and phenomena, but the total amount of energy remains constant in the universe. This emphasizes the need to link all physical and chemical changes with energy changes, whether absorption or release of energy. According to Henry (1976, pp. 340–341), to introduce energy concepts in education, they should be introduced gradually, considering the student's age. He proposed introducing them in four stages:

First stage: Developing knowledge of thermal changes and stressing that physical change is accompanied by thermal change.

Second stage: Some simple expansion of meanings of heat capacity and latent heat of changes that do not result in new materials, then presenting energy according to kinetic theory. Afterwards, considering physical changes as giving a simplified picture of the meanings of bond formation and breaking.

Third stage: Students should as early as possible get used to interpreting the tendency of reactions to occur in the direction of (a) gas release, (b) precipitate formation, (c) production of a weak electrolyte. These lead to discussions on equilibrium in cases of competing effects. At this stage, the difference between ΔH and ΔG should be clarified.

Fourth stage: More difficult, represented in the importance of energy transformation. It is desirable to provide a simple explanation of entropy changes in the system and universe. Reactions where ΔH is greater than ΔG, nearly equal, or smaller should be discussed. The idea of entropy should be introduced using terms of disorder and randomness as a function of the number of particles. This stage requires careful research, and I believe it is very important that more advanced students receive some information about the role and significance of entropy. At the middle school stage, we will limit ourselves to the first and second stages, where students should know that physical or chemical changes are accompanied by changes in temperature, i.e., changes in energy. Then they should know that materials decompose, their bonds break, and reorganize in another form to create new materials.

Several studies have addressed the concept of energy in different educational subjects. Among them is the study of Yassin Mohammed (2015), which shares with our research the proposal of a chemistry program according to energy concepts. This study aimed to build a teaching–learning program according to renewable energy and nanotechnology concepts and to examine its effect on technological literacy and ethical scientific awareness among third-year students in the Department of Chemistry. To verify this goal, the following null hypotheses were set: (1) There is no statistically significant difference at the 0.05 level between the mean scores of students in the experimental group who study nanotechnology and renewable energy using the teaching–learning program and the mean scores of students in the control group who study the same subject using the traditional method in technological literacy. (2) There is no statistically significant difference at the 0.05 level between the mean scores of students who study nanotechnology and renewable energy according to the teaching–learning program and the mean scores of students in the control group who study the same subject using the traditional method in ethical scientific awareness. The experiment was applied in the first semester of the academic year (2014–2015) on a purposive sample of third-year students in the Chemistry Department, College of Education for Pure Sciences – Ibn al-Haytham. The research sample consisted of 47 students, with 24 in the experimental group and 23 in the control group chosen randomly. The quasi-experimental design with a post-test for two equivalent groups was used. The teaching–learning program was built according to its approved stages, and the content was prepared from renewable energy and nanotechnology concepts. Two research tools were prepared: the technological literacy scale and the ethical scientific awareness scale. The technological literacy scale consisted of 36 items distributed across four domains: cognitive, skill, emotional, and socio-ethical. Its validity and reliability were verified. Statistical tools used included the t-test, factor analysis, Pearson correlation coefficient, effect size equation, and means. The results were as follows: (1) A statistically significant difference between the experimental and control groups in technological literacy in favor of the experimental group, with an effect size of 1.4. (2) A statistically significant difference between the experimental and control groups in ethical scientific awareness in favor of the experimental group, with an effect size of 1.2. In light of these results, the researcher recommended adopting the teaching–learning program based on renewable energy and nanotechnology concepts as part of the general curriculum of faculties of science education, as well as paying attention to modern scientific concepts to achieve better educational outcomes. She also suggested conducting further studies as a continuation of this research.

As for the study of Ali Siyam (2008), it aimed to identify the effect of a program calculated with individualized learning, training, and practice in teaching the unit of energy on scientific skills among seventh-grade students in physics. To answer the research questions and test its hypotheses, the researcher selected a purposive sample of seventh-grade students at Rafah Boys' Preparatory School for Refugees, consisting of three sections with a total of 90 students divided into three groups: the first experimental group (30 students), the second experimental group (30 students), and the control group (30 students). The study relied on two tools for data collection: an achievement test of cognitive scientific skills in the unit of energy composed of 40 multiple-choice items, and an observation card of performance scientific skills in the unit of energy composed of 14 items. The study concluded the following: there were statistically significant differences at the 0.05 level in cognitive scientific skills attributed to the teaching method, in favor of the first experimental group over the control group, showing the effectiveness of the program based on individualized learning, training, and practice in developing cognitive scientific skills in the energy unit among seventh-grade students. There were statistically significant differences at the 0.05 level in perfor-

mance scientific skills attributed to the teaching method, in favor of the first experimental group over the control group, and there were statistically significant differences at the 0.05 level in favor of the first experimental group over the control group, showing the effectiveness of the program based on individualized learning, training, and practice in developing performance scientific skills in the energy unit among seventh-grade students.

Problem of the Study:

The teaching of chemistry in middle education in Algeria relies on explaining all physical and chemical transformations using models. It would have been appropriate for the student to first recognize a variety of changes surrounding him in his daily life, then link them to changes in energy—things that are tangible and visible to the student at this stage of life—before moving on to explanations using models.

For this reason, we proposed a chemistry content based on energy as an entry point for teaching chemistry in Algerian middle education, and in this research we sought to determine the effectiveness of this designed content on the achievement of middle school students in Algeria.

Hypotheses: The research objectives are to test the following null hypotheses:

- There are no statistically significant differences at the 0.01 significance level between the mean achievement of the experimental group students and the mean achievement of the control group students.

- There are no statistically significant differences at the 0.01 significance level between the mean achievement of males in the experimental group and the mean achievement of females in the experimental group.

- There is no statistically significant correlation between the student achievement variable and the curriculum variable.

Importance of the Study: This research helps:

- **Chemistry curriculum planners:** by providing them with the most important concepts and approaches used in teaching chemistry in Algerian middle education.

- **Chemistry teachers and inspectors:** by providing them with revised chemistry content, as well as strategies for lesson planning and teaching strategies that assist them.

- **Researchers:** by opening new perspectives for experimenting with, evaluating, and proposing chemistry curricula for other levels, as well as other educational subjects.

Research Terms:

- **Concept of lesson planning:** Ramzi (2006) provides the following definitions:

  - Abdallah Abd Al-Da'im defines it as: drawing up the educational policy in its complete form, a plan that should be based on a comprehensive understanding of the demographic situations of countries, labor energy conditions, economic, educational, and social conditions.

  - Shibl Badran defines it as: predicting the course of the future in education and controlling it in order to achieve balanced educational development, optimal use of available human and financial resources, and linking educational development with comprehensive economic and social development.

  - Mohamed Seif Al-Din Fahmi defines it as: the continuous organized process that includes methods of social research and the principles and methods of education, administration, economics, and finance, with the aim that students receive adequate education with clear objectives.

- **Developed content:** The proposed content for teaching after undergoing processes of adjustment, development, or change.

- **Middle education stage:** The second stage after elementary education, lasting four years, divided into three phases: the adaptation stage (first year), the support and deepening stage (second and third years), and the guidance stage (fourth year). Student ages range between eleven (11) and sixteen (16) years.

- **Chemistry subject:** The content devoted to studying matter in terms of its properties, structure, composition, behavior, reactions and interactions, and its applications in daily life.

Research Methodology and Procedures:

- **Research population and sample:**

The research population includes all first- and second-year students in middle schools in Medea Province, Algeria, at the time of the study.

A random sample of one hundred fifty (150) first- and second-year middle school students was selected, divided into a control group and an experimental group.

The control group included seventy-one (71) students: thirty-four (34) males and thirty-seven (37) females. The experimental group included seventy-nine (79) students: forty (40) males and thirty-nine (39) females, as shown in the following table:

	Experimental group	**Control group**
	Total	Males
First year	38	20
Second year	41	20
Total	79	40

Table (01): Distribution of the research sample students across the first and second year of middle school.

- **Research tools:** To verify the research hypotheses, we used the following tools:

1. **Preparation of chemistry content based on the concept of energy:**

○ *First year of middle school:* We propose teaching physical changes using experiments that demonstrate these changes and link them to changes in temperature, i.e., energy changes, in line with the chosen approach. The current Algerian chemistry curriculum focuses only on changes of state (between solid, liquid, and gaseous states), while physical change involves changes in the appearance of matter, taste, color, magnetic state, etc. We ensured that these experiments were drawn from the student's daily life and used non-toxic materials, as shown in the following table:

Unit	**Educational units**	**Teaching/learning procedures**	**Number of sessions**	**Educational objectives**
Physical change	• Heating paraffin • Heating glass	1	- Recognize a variety of chemical materials (paraffin, glass, marble, platinum) and describe them (hardness, color, smell, density, melting point). - Identify physical changes and link them to changes in temperature. - Verify the law of conservation of mass in physical change.	

Unit	Educational units	Teaching/learning procedures	Number of sessions	Educational objectives
	• Heating marble • Heating a platinum wire	1		

Table (02): Proposed educational units for teaching first-year middle school students.

• *Second year of middle school:* We include experiments covering most types of chemical reactions: combination, decomposition, single replacement, double replacement, and combustion, to help students recognize a considerable number of chemical substances and their physical and chemical properties, and link these reactions with changes in temperature and energy. Since the current Algerian curriculum covers only a few substances and reactions, additional experiments should be introduced—color changes, disappearance and appearance of substances, formation of precipitates—because at this age students depend on sensory observation and description. We ensured that the selected substances are colored and that their reactions yield observable products, making them suitable for the students' age. See the following table:

Unit	Educational units	Teaching/learning procedures	Number of sessions	Educational objectives
Chemical change	Combination of elements or compounds to form new substances	• Combination of iron and sulfur • Combination of iodine and aluminum	1	- Recognize chemical changes and link them to changes in energy. - Recognize a variety of chemical substances and describe them. - Identify most types of chemical changes (combination, decomposition, single replacement, double replacement, combustion). - Understand that substances react (combine, decompose, burn) to produce new substances different from the starting materials in a chemical transformation. - Express reactions using word equations, then symbols.
	• Combination of copper and oxygen • Heating magnesium ribbon	1		
	Decomposition of compounds to form new compounds	• Heating sugar • Heating copper carbonate • Heating mercury oxide	1	

Unit	Educational units	Teaching/learning procedures	Number of sessions	Educational objectives
	Combustion of substances to form new substances	• Combustion of hydrogen • Combustion of carbon	1	
	• Combustion of propane • Combustion of magnesium	1		

Table (03): Proposed educational units for teaching chemistry to second-year middle school students.

2. **Preparation of lesson cards:** The researchers prepared cards for applying the selected educational units. These cards include objectives to be achieved by the teacher at the end of the session, necessary tools, laboratory safety precautions, class activities, and the final blackboard summary, based on educational literature on lesson planning.

3. **Preparation of a teacher's guide:** Lesson cards were accompanied by a guide designed to help teachers implement this curriculum. It includes educational objectives, key concepts teachers should master, and clarifications on experiments and materials used.

4. **Preparation of an achievement test:** Two tests were prepared, one for each year, each including multiple-choice questions and one open question requiring writing equations. The aim was to measure student achievement after applying the proposed curriculum lessons. These were applied to both the experimental and control groups.

- **Validity and reliability of the test:** The achievement tests were validated by presenting them to chemistry teachers in middle education and specialists in chemistry education. Some modifications were made based on reviewers' recommendations.

Statistical Processing:

To verify the previous hypotheses, we used the independent samples *t*-test to compare two independent groups. According to Al-Munizil (p. 233), the assumptions of the independent samples *t*-test include: random sampling, normality of the two populations, independence of observations, random distribution of samples into groups, and equality of population variances. All assumptions can be confirmed through researcher procedures, except the last, which is checked using a homogeneity test (Levene's test). We also used Pearson's correlation coefficient to test the relationship between curriculum and achievement.

Results and Discussion:

Study Results and Discussion:

First Year of Middle School:

1- There are no statistically significant differences at the significance level of 0.01 between the average achievement of students in the experimental group and the average achievement of students in the control group in the first year of middle school.

By applying the Student's *t* test for independent samples, we obtain the following results:

First Year	Sample Size	Mean	Standard Deviation	Standard Error of the Mean
Academic Achievement – Experimental	38	15.53	3.85	.62

First Year	Sample Size	Mean	Standard Deviation	Standard Error of the Mean
Academic Achievement – Control	33	10.79	3.84	.67

Levene's Test for Homogeneity of Variance	*t* Test for Equality of Means	95% Confidence Interval
F	Sig.	*t*
Academic Achievement – Equal Variances Assumed	.00	.975
Academic Achievement – Equal Variances Not Assumed	5.18	67.65

Table (04): Student's *t* test results for the achievement test for first-year middle school students

Levene's test for homogeneity of variance indicates that the value of F is not statistically significant at the 0.01 significance level, which means there is homogeneity in variance. Therefore, we select the *t* test for equal variances. Looking at the results of the *t* test for equality of variances, it equals 5.18 with 69 degrees of freedom, which is statistically significant at the 0.01 level. This means that there are statistically significant differences at the 0.01 significance level. Considering the means, the experimental group had a mean of 15.53, while the control group had a mean of 10.79, meaning the differences are in favor of the experimental group. From all the above, there are statistically significant differences between the achievement of the experimental group and the control group in the first year of middle school, in favor of the experimental group.

2- There are no statistically significant differences between the achievement of males in the first year of middle school and females of the same year.

By applying the Student's *t* test for independent samples, we obtain the following results:

First Year	Sample Size	Mean	Standard Deviation	Standard Error of the Mean
Academic Achievement – Females	18	16.11	3.18	.75
Academic Achievement – Males	20	15.00	4.38	.98

Levene's Test for Homogeneity of Variance	*t* Test for Equality of Means	95% Confidence Interval
F	Sig.	*t*
Academic Achievement – Equal Variances Assumed	2.41	.129
Academic Achievement – Equal Variances Not Assumed	.90	34.54

Table (05): Student's *t* test results for the achievement test of students in the experimental group for the first year of middle school

Levene's test for homogeneity of variance indicates that the value of F is not statistically significant at the 0.01 significance level, which means there is homogeneity in variance. Therefore, we select the *t* test for equal variances. Looking at the *t* test results for equal variances, it equals 0.89 with 36 degrees of freedom, which is not statistically

significant at the 0.01 level. Thus, there are no statistically significant differences between the achievement of males and females in the first year of middle school.

3- There is no statistically significant correlation between the achievement of first-year middle school students and the proposed curriculum for the same year.

By applying Pearson's correlation test, we obtain the following results:

Variable	Academic Achievement	Curriculum Variable
Academic Achievement	Pearson Correlation = 1	.529**
	Sig. = .000	
	N = 71	N = 71
Curriculum Variable	Pearson Correlation = .529**	1
	Sig. = .000	
	N = 71	N = 71

Table (06): Pearson's correlation test results for the achievement test of first-year middle school students

From the table, the correlation coefficient equals 0.529, which means there is a moderate positive correlation between the achievement variable and the curriculum variable. The probability was 0.000, meaning this correlation is statistically significant. Thus, there is a moderate positive correlation between the achievement of first-year middle school students and the proposed curriculum for the same year at the 0.01 significance level.

Second Year of Middle School:

1- There are no statistically significant differences at the 0.01 significance level between the average achievement of students in the experimental group and the average achievement of students in the control group in the second year of middle school.

By applying the Student's *t* test for independent samples, we obtain the following results:

Group	Sample Size	Mean	Standard Deviation	Standard Error of the Mean
Academic Achievement – Experimental	41	16.6463	2.54029	.39673
Academic Achievement – Control	38	13.4474	2.13652	.34659

Levene's Test for Homogeneity of Variance	*t* Test for Equality of Means	95% Confidence Interval
F	Sig.	*t*
Equal Variances Assumed	3.322	.072
Equal Variances Not Assumed	6.072	76.306

Table (07): Student's *t* test results for the achievement test of second-year middle school students

Levene's test for homogeneity of variance indicates that the value of F is not statistically significant at the 0.01 significance level, which means there is homogeneity in variance. Therefore, we select the *t* test for equal variances. Looking at the value of *t* for equal variances, it equals 6.033 with 77 degrees of freedom, which is statistically significant at the 0.01 level. This means there are statistically significant differences at the 0.01 level. Considering the means, the experimental group had a mean of 16.64, while the control group had a mean of 13.44, which means the differences are in favor of the experimental group. From all the above, there are statistically significant differences between the achievement of the experimental group and the control group in the second year of middle school, in favor of the experimental group.

2- There are no statistically significant differences between the achievement of males in the second year of middle school and females of the same year.

By applying the Student's *t* test for independent samples, we obtain the following results:

Second Year	**Sample Size**	**Mean**	**Standard Deviation**	**Standard Error of the Mean**
Academic Achievement – Males	20	16.2000	2.72609	.60957
Academic Achievement – Females	21	17.0714	2.33605	.50977

Levene's Test for Homogeneity of Variance	***t* Test for Equality of Means**	**95% Confidence Interval**
F	Sig.	*t*
Equal Variances Assumed	.960	.333
Equal Variances Not Assumed	-1.097	37.462

Table (08): Student's *t* test results for the achievement test of students in the experimental group for the second year of middle school

Levene's test for homogeneity of variance indicates that the value of F is not statistically significant at the 0.01 level, which means there is homogeneity in variance. Therefore, we select the *t* test for equal variances. Looking at the value of *t* for equal variances, it equals -1.101 with 39 degrees of freedom, which is not statistically significant at the 0.01 level. Thus, there are no statistically significant differences between the achievement of males and females in the second year of middle school.

3- There is no statistically significant correlation between the achievement of second-year middle school students and the proposed curriculum for the same year.

By applying Pearson's correlation test, we obtain the following results:

Variable	**Academic Achievement**	**Curriculum Variable**
Academic Achievement	Pearson Correlation = 1	.567**
	Sig. = .000	
	N = 79	N = 79
Curriculum Variable	Pearson Correlation = .567**	1

Variable	Academic Achievement	Curriculum Variable
	Sig. = .000	
	N = 79	N = 79

Table (09): Pearson's correlation test results for the achievement test for second-year middle school students

From the table, the correlation coefficient equals 0.567, meaning that there is a moderate positive correlation between the achievement variable and the curriculum variable. The probability was 0.000, which means that this correlation is statistically significant. Thus, there is a moderate positive correlation between the achievement of second-year middle school students and the curriculum variable for the same year at the 0.01 significance level.

Interpretation of the Results:

From the above, we find statistically significant differences at the 0.01 significance level between the achievement of the experimental group and the achievement of the control group, and these differences are in favor of the experimental group in both the first and second years of middle school in Algeria. This is attributed to the change in the teaching approach of chemistry from a model-based approach to an energy-based approach, meaning that the new approach has a positive effect on students' achievement in middle school in Algeria.

There are no statistically significant differences between the achievement of males in the experimental group and the achievement of females in the same group in both the first and second years of middle school. This means that the chosen approach to teaching chemistry in middle school has the same effect on both females and males, which supports its use in Algerian middle schools since they are mixed schools.

There is a positive correlation between the achievement variable and the curriculum variable, and this positive correlation is statistically significant at the 0.01 level. This means that the improvement in students' achievement results was associated with the change in the curriculum, that is, the change in the teaching approach of chemistry in middle school.

Research Proposals:

1. Valuing the results of researchers in developing and revising curricula, and taking into account the results they achieve.
2. Carrying out periodic reforms of curricula in various subjects in order to keep pace with all developments in various fields, as well as keeping pace with other countries and their advanced curricula.
3. Focusing on the educational content of subjects and giving it importance.
4. Applying the proposed curriculum to larger samples and in various regions of the country.
5. Including units in the chemistry curriculum that rely on energy as an entry point to learning.

Findings

1. Improved Achievement:
- The experimental group's performance showed statistically significant improvement over the control group at the 0.01 significance level.
2. Positive Correlation:
- A strong positive correlation was found between the achievement scores of students and the energy-based curriculum design, confirming its pedagogical impact.
3. Curriculum Relevance:
- Teachers reported that the integration of energy as a central theme provided coherence across topics, making chemistry more relevant to everyday life and other sciences.
4. Scalability:
- Results suggest that the proposed approach can be effectively scaled to larger samples and implemented in diverse Algerian educational contexts.

Acknowledgment

The author expresses sincere gratitude to the participating schools, teachers, and students for their collaboration and valuable contributions. Appreciation is also extended to the Laboratory of Science Didactics at the École Normale Supérieure, Kouba, for academic and logistical support.

Funding

This research did not receive external funding. It was carried out as part of the author's independent academic work within the Laboratory of Science Didactics, École Normale Supérieure, Kouba (Algiers).

Conflict of Interest

The author declares no conflict of interest regarding the publication of this article.

Ethical Considerations

The study followed all ethical guidelines applicable to educational research. Participation of students was voluntary, and informed consent was obtained from both students and their parents/guardians. The anonymity and confidentiality of participants were strictly maintained. The research design and data collection procedures were reviewed and approved by the Laboratory of Science Didactics' internal ethics review board.

Title of research article

The Correctness of Arabic Linguistic Structures: Concepts, Foundations, and Analytical Approaches

Charef Tahar
Research Scholar
University of Ziane Achour in Djelfa
Algeria
E-mail: tahar.charef@univ-djelfa.dz

Issue web link	https://imcra-az.org/archive/385-science-education-and-innovations-in-the-context-of-modern-problems-issue-11-vol-8-2025.html
Keywords	Correctness of structures – Intuition – Flexibility of language – Contextual clues – I'rab – Avoidance of ambiguity.

Abstract
This research examines the correctness of Arabic linguistic structures by exploring their conceptual and foundational dimensions within the broader framework of Arabic grammar, discourse, and stylistics. The study argues that linguistic correctness is not merely a matter of formal rule application but is grounded in the preservation of the general system of the Arabic language—a system marked by its structural flexibility, lexical richness, and aesthetic beauty. Particular emphasis is placed on the role of iʿrāb (inflection) as a decisive marker of meaning, the dynamics of omission and reduction in syntax, and the significance of contextual clues in disambiguating structures.
By integrating descriptive analysis with interpretative approaches, this work demonstrates that grammatical knowledge alone is insufficient without the cultivation of refined linguistic taste, critical reading, and stylistic practice. Creativity in Arabic discourse arises from an informed balance between normative rules and the intuitive insights of native usage, ensuring both clarity and expressiveness. The study highlights how linguistic correctness contributes to communicative precision, prevents ambiguity, and fosters a deeper appreciation of the literary and rhetorical heritage of Arabic.

Introduction

The correctness of linguistic structures and their social circulation is a requirement through which language is elevated, gains prestige, and spreads. One manifestation of this in reality is the repeated use and circulation of language among its speakers in their daily communication—spoken, dialogued, or written—while observing normative rules and what Arabs have recognized as norms and customs, meaning adherence to linguistic conventions and prevailing usage. This applies whether in communication to fulfill needs and purposes, to express inner emotions and the depths of the soul, or to guide thought and persuade the addressee, and in working to create an Arab linguistic community, intellectually and ideologically, where the features and characteristics of its language are smoothly and correctly applied once interaction or contact is made, whether in dealing or companionship.

The correctness of structures in Arabic does not contradict pure Arab intuition, as it preserves the foundations, adheres to the rules of grammar, morphology, and phonology, and aligns with the lexical and terminological meanings of words in terms of accuracy, strength, firmness, ease, and eloquence. It also conforms with the Arabic style, characterized by simplicity, smoothness, precision of description and imagery, persuasive power, and strong impact.

In this paper, we wanted to answer such questions as: What is the path to linguistic correctness? What are the manifestations of correctness in the structures of our Arabic language? What is required to achieve this correctness and proper understanding? And should we pursue independent effort in this, working to elevate and spread this language?

1- Intuition, Origin, and Learning

Intuition (al-salīqa) is the clear path and the natural disposition; a man speaks by intuition, that is, by his nature and pure, sound taste, without learning or training. It is often used in reference to the eloquence of language; thus, the intuitive (al-salīqī) is the one who speaks eloquently by the disposition and nature on which he was raised, without learning, with fluency, unpretentiously, and without reliance on standards or imitation. The intuitive among the reciters is the one who recites the Qur'an by his nature, without having studied or recited under the reciters. For a construction to be acceptable, in circulation, and effective, it must be intuitive, easy on the tongue, palatable to both ear and mind through interaction and acceptance, not contradicting what the Arab taste has acknowledged from the pure source to which the soul leans by nature, and it must come described as being issued from disposition and instinct, and received likewise under the same description, without affectation in striving for ease and simplicity. For intuition, just as it is praised for simplicity and eloquence, may also be criticized for lack of i'rāb (inflection), or for excessive looseness in giving free rein to the tongue and its freedom to the point of contradiction and falling into linguistic error. The poet said: *"I am not a grammarian twisting his tongue ... but an intuitive speaker, I speak and inflect correctly."* It is said that Abū al-Aswad al-Duʾalī laid down grammar when linguistic error spread in the speech of the Arabs and intuition dominated, without consideration for the rules of grammar and inflection; here there was the possibility of error. In this respect, intuition is criticized. We spoke here of intuition because its basis is positive, and because speech described by it is accepted, and because it is the original foundation prior to the grammatical rules which came after intuition weakened.

2- Flexibility and Breadth of Arabic Construction

Flexibility in Arabic construction means its ease of adaptation and transformation through preposing or postposing, deletion or addition, substitution or alteration. This is a sign of the vitality, dynamism, and interaction of constructions, and thus of their development and spread. It also indicates *"the sharp intelligence of its speakers, the precision of their observation, the subtlety of their feeling, the fertility of their imagination, and their ability to innovate in expression and imagery. For this reason, it is considered among the greatest features and characteristics of the language."* Flexibility of the language corresponds to the abundance of its vocabulary and the multiplicity of its sentences, and consequently, the breadth of its meanings and its capacity for different styles, which facilitates communication and expression of all purposes, and indicates as well the abundance of its resources and the originality of thought expressed through it.

Examples indicative of the flexibility of Arabic are so numerous they cannot be confined, nor does this context allow mention of many of them. By way of example, we mention some:

- Addressing the singular in the form of addressing two, such as the words of Imru' al-Qays: *"Stop, let us weep, for the memory of a beloved and a dwelling ... at the edge of al-Liwā between al-Dakhūl and Ḥawmal."*

  It was customary among the Arabs to extend the address of the singular to two and to the plural, as part of the flexibility of their tongues. Similarly, the poet said: *"If you both rebuke me, O son of ʿAffān, I desist ... and if you both protect me, I shall defend a well-guarded honor."*

  "It is permissible that what is meant is: 'Stop, stop,' and the addition of the alif is a sign indicating that what is meant is repetition of the word, as Abū ʿUthmān al-Māzinī said about the Almighty's words: {He said: My Lord, return me} [Al-Mu'minūn: 99]—the intended meaning being: 'Return me, return me,

return me,' and the wāw was made a sign implying that the meaning is repetition of the word several times..."

- Among the forms of the flexibility of Arabic is the general permissibility of deletion, including deletion of the subject and the object when they are understood from contextual evidence of situation or speech, the aim being to strike the correct place recognized by sound Arab intuition. All this indicates the adaptability, compliance, flexibility, and breadth of Arabic constructions.

- Among the factors in realizing the flexibility and breadth of Arabic is i'rāb: *"For i'rāb gives the speaker breadth in expression, and freedom in speech, allowing preposing and postposing without affecting the correctness and soundness of meaning, as the speech remains understood; such flexibility is not found in inflected languages."* I'rāb is one of the foundations of Arabic grammar, one of its distinguishing features, a factor of its richness, and a means for diversity in its modes of expression.

3- The Value of the Word in Its Harmony with Others

The construction of the word with others, with consideration for its order and harmony in a particular way that observes their semantic connection, is what reveals its value and eloquence, and by it the purpose of communication is realized. *"The individual word has no inherent importance, however harmonious its letters may be, or pleasant its sound and tone; rather, its importance appears when it is organized with others, when it suits what is adjacent to it and agrees with it."*

Quality of composition is not realized by the mere availability of words without the talent and ability to perfect the linking and composition among them. *"If the mere availability of material were sufficient to achieve good composition—which is the arrangement of suitable words and their application to appropriate meanings—then the craft of composed speech in letters, sermons, and poetry would be easy; but the reality is otherwise, as even the eminent fall short of attaining this level."* For this reason, composition has been a sought-after goal known only among the few renowned for seriousness and diligence, while many fell short of it, and some composed but became known for the weakness of their writings, whether for awkwardness or complexity, or for poor estimation of the concord between meaning and the constructions used to express it. Thus, the quality of expression and writing appears in the perfection of linking first between the elements of construction, and second between the construction and its meaning.

4- Clues Helping Determine Meaning

4.1 I'rāb and Giving Priority to Meaning over Parsing

I'rāb, in grammatical terminology, is what attaches to the endings of words by way of change according to the factors mentioned—pronounced or implied—that enter upon these words. Giving priority to meaning over parsing in the analysis of constructions means focusing on the intended meaning of the construction and its interpretation, giving it precedence. In cases of grammatical disagreement, grammarians and linguists tend to prefer the interpretation and estimation that serve the meaning and the purpose of the construction and communication. I'rāb is not valid except after understanding the meaning, for according to the grammarians, i'rāb is secondary to meaning. Al-Zajjājī (d. 337 AH) says: *"If it is said: You have mentioned that i'rāb enters into speech, so what necessitated it and why was it needed? The answer: Since nouns are subject to various meanings—they can be subject, object, possessed, or possessor—and since their forms and structures did not indicate these meanings but were shared, the i'rāb movements were placed in them to signify these meanings. So they said: Ḍaraba Zaydun ʿAmran' (Zayd struck ʿAmr), raising Zayd to show that the action is his, and putting ʿAmr in the accusative to show that the action falls upon him."*

The i'rāb movement, just as it distinguishes between the functions of words, also distinguishes between meanings, but it is not the only clue for distinguishing between them; there are other clues such as context, order, situation, lexical meaning, intonation, and others.

4.2 Clues Clarifying and Determining Meaning

The general meaning of constructions and expressions of the language is determined by its system and conventions, and other clues may work together to direct, clarify, or define the meaning. These include the current situation, the linguistic context, social custom, community culture, and lexical-semantic meaning. Among the clues that serve as reference points in Arabic, often clarifying meaning even unintentionally—and which linguists have mentioned in different places, including Ibn Jinnī, who mentioned five with their examples—are:

1. The clue of order, as in: *"Ḍaraba Yaḥyā Bushrā"* (Yaḥyā struck Bushrā).

2. The clue of lexical appropriateness, as in: *"Akhala Yaḥyā kumtharā"* (Yaḥyā ate a pear).

3. The clue of agreement between verb and subject in gender and number, as in: *"Ḍarabat hādhā hādhihi"* (this [female] struck this [male]), and *"Kallama hādhihi hādhā"* (this [male] spoke to this [female]).

4. The clue of the i'rāb sign: the alif and yāʾ of the dual, and the wāw of the plural, as in: *"Akrama al-Yaḥyayān al-Bushrayayn"* (the two Yaḥyās honored the two Bushrās), and *"Ḍaraba al-Bushrayīn al-Yaḥyūn"* (the Yaḥyās struck the two Bushrās).

5. The clue of situation (context): *"Waladat hādhihi hādhihi"* (this one gave birth to this one); the elder is the mother, the younger is the daughter.

All these clues contribute to determining meaning and must be considered before undertaking parsing. The benefit of relying on clues in interpreting constructions or in understanding grammatical relations is that it removes from Arabic grammar

A- Every speculative or logical interpretation of contextual phenomena.

B- Every debate about the logic of this "work" or that, and the authenticity of some words in the work and the derivativeness of other words, and the strength of the factor or its weakness... These indicators are responsible for clarity of meaning and protection from ambiguity, since the abstract linguistic meaning of the text (the apparent meaning of the text) may not be the intended one itself, but the intended meaning is hidden behind the words, where the indicators play the essential role in determining what is meant.

4-3 The syntactic meaning, the linguistic meaning, and the right of parsing

The syntactic meaning is the meaning determined by grammar, and it is derived from the specific structure of words in sentences and phrases, not the original linguistic meaning of the words. It means suspension or correlation; that is, the relationship between words which in turn affects the general meaning of sentences and phrases. Among the examples is the preference of the adjective over the circumstantial clause based on context in the saying of one of the men of Banu Sulul to a native-born man:

"And indeed, I pass by the vile one insulting me * Yet I went on, then said: it does not concern me."

Some grammarians preferred that the clause (insulting me) be adjectival rather than circumstantial, meaning: a vile person whose habit is constant, even though it is related to the word (the vile one), which is definite. This contradicts the common norm that sees clauses after definite nouns as circumstantial. But meaning was more deserving of attention, and the reference here is to the syntactic meaning, not the linguistic meaning.

5.Reconciling grammatical craftsmanship, order, and serving meaning

Grammarians emphasized maintaining grammatical craftsmanship as much as possible and adhering to the general order of the language, and reconciling the two in cases of conflict or potential conflict, with a focus on prioritizing what serves meaning and removes ambiguity, giving this precedence over parsing while attempting estimation and interpretation to preserve the value and right of parsing. Among the grammarians who addressed this issue was Ibn Jinni, in a chapter he included in his book *Al-Khasa'is* which he called "Chapter on the difference between the estimation of parsing and the interpretation of meaning." He said in it:
"Do you not see the difference between the estimation of parsing and the interpretation of meaning? So if something of this sort comes from our scholars, guard yourself from it and do not be carried away by it. If you can make the estimation of parsing conform to the interpretation of meaning, that is the utmost. But if the estimation of

parsing contradicts the interpretation of meaning, then accept the interpretation of meaning as it is, and correct the path of the estimation of parsing, so that nothing escapes you. Beware of being carried away so that you corrupt what you aim to correct."

He also expressed his comfort with giving priority to meaning and correcting parsing in cases of conflict in another chapter which he called "Chapter on the tension between meanings and parsing," where he said:

"This was a place Abu Ali, may God have mercy on him, often frequented, concerned himself with, and encouraged review and careful consideration of. For you find in much prose and poetry that parsing and meaning contend with one another: this calls you to one thing, and this prevents you from it. Whenever they seize upon a piece of speech, I held fast to the bond of meaning and found ease in correcting parsing."

This is a wide field in the study of syntactic structures, and an important one that requires precision and study due to the secrets it holds, with many examples in the Book of God and in Arabic poetry. The correct understanding of Arabic texts takes into account both: meaning and parsing, for they are interdependent. The first consideration is for meaning, as it is what the speech is built upon, and the second consideration is for the principles of grammar and its rules. The perspective of grammarians aligned grammatical craftsmanship with the correctness of meaning, emphasizing the role of meaning in analyzing structures, guiding parsing, and estimating its justifications.

6- The requirement of avoiding ambiguity and ensuring clarity of meaning

The speaker always strives to compose speech that is clear and unambiguous, whether for the purpose of simplification or when deviating from the usual pattern for another communicative purpose. Likewise, researchers in analyzing structures aim to achieve the requirement of avoiding ambiguity and ensuring clarity of meaning. If ambiguity cannot be avoided, the usual pattern must not be violated in any form of transformation or alteration.

Examples of deviating from the usual pattern when ambiguity is avoided include:

- "Do they wait but that Allah should come to them in canopies of clouds" (Al-Baqara: 210). The coming of Allah means the coming of His command and His might, where the annexed word was omitted and the annexed-to was placed in its stead. "The omission of the annexed word and the placement of the annexed-to in its place is frequent and common in the speech of the people when ambiguity is avoided. And it was said: the estimation is that Allah's punishment should come to them in canopies of clouds."

- "And the thief, the male and the female, cut off their hands" (Al-Ma'ida: 38), where the dual (their hands) was used.

- "But if they of themselves be content to remit any part of it unto you, then eat it" (An-Nisa: 4), where the singular "self" was used while plural was intended.

- "And marry not those women whom your fathers married" (An-Nisa: 22), where originally "who" is used for rational beings, but ambiguity here is avoided.

- The poet's verse: "Eat in part of your stomachs and you will remain chaste ... for your time is a time of hunger," where the singular stomach was used but the plural was intended.

- The poet's verse: "Our sons are the sons of our sons, and our daughters ... their sons are the sons of distant men," where he began with "our sons" then reverted to the original with "our daughters."

7- Foundations of the soundness of constructing Arabic discourse

The soundness of Arabic structures and the correct circulation of Arabic discourse cannot be achieved except by those equipped with grammatical knowledge, practiced in refined Arabic styles, acquainted with the correct ways of expression, appreciative of the beauties and marvels of the Arabic language, and living with the masters of eloquence and artistry through reading and interaction.

7-1 Grammatical knowledge

Grammatical knowledge is the acquisition of the mechanism and ability to understand grammar rules and apply them to structures in speech or writing, maintaining the correct structure in terms of choice of words, their adjacency, and their relationship with one another. It is an ability and faculty acquired through learning and developed through conscious practice leading to the refinement of the user's language.

7-2 Mastery of refined Arabic styles

Mastery of refined Arabic styles means excelling in the use of the constructions and authentic elevated expressions of the Arabic language, to convey meanings and ideas with precision and artistry. This is only achieved through abundant conscious reading of literary prose and poetic texts that combine precision of structure, beauty of imagery, and depth of meaning, along with practice in usage, understanding, and appreciation. Thus, the one practiced in the language acquires the ability to distinguish between styles and choose appropriate words for expression.

7-3 Linguistic taste and sensitivity to the beauty of Arabic

Taste assists in selecting words appropriate to context in speech, writing, and composition. It is cultivated and grows through continuous reading and listening to selected eloquent texts. Through it one distinguishes between refined and weak styles, feels them, lives through the transformations of linguistic structures, and interacts with their beauty.

7-4 Harmony and coexistence with the language and its styles

When the speaker uses the language as a tool of thought and communication and conveys daily purposes in eloquent speech, through its various styles of description and dialogue, persuasion, and expression of emotions and feelings—intending thereby to enrich their linguistic resources and expand their ability to employ refined styles—they thereby live in harmony with it, responsive, present in their mind in every situation and statement; creative when writing, persuasive when speaking.

Conclusion:

It has become clear from the foregoing that the soundness of Arabic discourse structures, the achievement of their intended purpose, and the elevation of their styles cannot be realized except through the combination of interrelated elements that represent the pillars of composition, analysis, and understanding. Their foundation is linguistic instinct and natural disposition, but there is no escape from acquiring grammatical knowledge, practice, and training in refined styles, in order to cultivate refined taste that distinguishes between fluent and weak style, and linguistic sensibility that discerns between clarity and obscurity. The flexibility of the Arabic language, its vast resources, the precision of parsing, and the effectiveness of contextual indicators have been powerful pillars in the richness and immortality of this language, and in its ability to meet the needs of expression and communication with clarity, eloquence, and harmony. This is indispensable for every learner, scholar, and creative writer.

Findings

1. Rule-Intuition Integration – Correct Arabic structures require the harmonious application of grammar with the intuitive logic of native expression.
2. Role of Contextual Clues – Interpretation of meaning cannot rely solely on syntactic markers; pragmatic and contextual indicators are essential for accuracy.
3. Centrality of Iʿrāb – Inflection remains a foundational element in distinguishing syntactic functions, semantic relations, and rhetorical effects.
4. Linguistic Creativity – True innovation in Arabic discourse emerges through mastery of grammar, exposure to refined texts, and active stylistic practice.
5. Aesthetic Dimension – Correctness extends beyond function to include eloquence, clarity, and the preservation of Arabic's literary identity.

Ethical Considerations

This research adheres to academic integrity by providing a transparent analysis of linguistic structures without distortion or misrepresentation. All sources used in the literature review have been acknowledged, and no part of

the study involves human or animal experimentation. The work respects cultural sensitivities by treating Arabic linguistic heritage with accuracy and responsibility.

Funding

This research did not receive any specific grant from funding agencies in the public, commercial, or not-for-profit sectors.

Conflict of Interest

The author declares no conflict of interest.

Acknowledgments

The author expresses gratitude to colleagues at the University of Ziane Achour in Djelfa for their encouragement and to the broader community of Arabic linguists and grammarians whose insights continue to inspire the study of the Arabic language. Special thanks are extended to the reviewers and peers who provided constructive feedback on earlier versions of this work.

Keywords Resource-saving culture; natural resources; preschool education; older preschool children; diagnostics.

Abstract
This study investigates the relevance and methodology of diagnosing the level of formation of a resource-saving culture in older preschool children. The research highlights the increasing urgency of rational and careful use of natural resources in the context of global ecological and economic challenges. A pedagogical experiment was conducted in a state preschool institution in Minsk, where diagnostic tools such as structured interviews, picture-based tasks, and targeted observations were applied to assess children's knowledge, attitudes, and behavioral readiness for resource-saving practices. The results revealed significant variations in children's understanding of natural resources and their conservation, indicating that the process of forming a culture of resource-saving at this age is still at an early developmental stage. The study emphasizes the importance of initiating resource-saving education during preschool years as a foundation for sustainable behavior in adulthood.

Actuality

In today's world, the worsening ecological and economic situation is directly linked to the overconsumption of natural resources, depletion of non-renewable reserves, and increasing environmental pollution. Against this background, the need for rational and careful use of resources has become an urgent global priority. The preschool period is a critical developmental stage when the foundations of future personality are formed, and social norms and behaviors are internalized. Introducing children to resource-saving culture during this period fosters ecological consciousness, responsibility, and respect for nature from the earliest stages of development. Despite the theoretical recognition of the im-

portance of resource-saving culture, its practical implementation in preschool education remains limited, which underlines the significance and timeliness of this research.

1. Introduction

In the contemporary world, the global community faces an aggravation of both economic and ecological conditions, largely due to increased resource consumption, depletion of non-renewable natural resources, and environmental pollution caused by industrial and domestic waste. Under these circumstances, the necessity for rational and careful use of natural resources has acquired critical urgency.

One of the key tasks of the preschool education system is therefore the formation of the foundations of a culture of resource-saving in young children. The importance of addressing this issue at an early age is explained by the fact that the preschool period is a unique stage of human development, during which the foundations of future personality are laid. At this age, a child begins to form multifaceted relationships with the surrounding world and with themselves, while developing qualities that will later determine their "face" as a socially responsible individual. Entering life, mastering social norms and rules, and engaging in diverse activities, the child's behavior is shaped and refined.

A review of psychological and pedagogical literature has shown that various aspects of this problem are being developed. The close relationship between the general state of economic development of society and the individual's economic maturity was emphasized by ancient philosophers (Aristotle, Xenophon, Plato) as well as modern economists (L.P. Ponomarev, V.D. Popov, V.P. Chikanov, B.F. Shemyakin). The necessity of economic education at the preschool stage is also underlined in the works of many national pedagogues (L.I. Galkina, L.A. Golub, L.D. Glazyrina, M.F. Grischenko, E.A. Kurak, N. Selivanova, A.A. Smolentseva, A.D. Shatova). Methodologies for the formation of resource-consumption and resource-saving culture are detailed in the works of S.D. Galkina, E.V. Glushchenko, L.B. Klimkovich, I.P. Roslovtseva, and others.

At the current stage, however, the problem of fostering a resource-saving culture, despite its theoretical and practical significance, remains more at the level of problem-setting than of practical resolution.

2. Materials and Methods

2.1. Study Base

The experimental research was carried out at the State Preschool Education Institution "Nursery–Kindergarten No. 244 of Minsk." A total of 52 children from two senior preschool groups were divided into experimental and control cohorts.

2.2. Research Aim

The purpose of the diagnostic stage of the pedagogical experiment was to determine the level of formation of the components of a resource-saving culture among older preschool children.

2.3. Procedure

The diagnostic procedures were conducted in the morning hours. On average, 30 minutes were allocated for each child, taking into account the time needed to establish contact with the participant. The study was organized in a familiar environment with the presence of a close relative or preschool teacher to minimize stress and ensure the child's emotional comfort.

Three diagnostic methods were applied:

1. **Diagnostic conversation** – assessing the child's conceptual understanding of natural resources and conservation;

2. **Picture-based tasks** – designed to match the visual-imaginative thinking characteristic of this age group, accompanied by oral explanations from the researcher;

3. **Targeted diagnostic observation** – to capture children's real-life behaviors over one week in relation to the use of resources such as water, electricity, heat, and waste management.

3. Diagnostic Tools

3.1. Diagnostic Conversation

During the conversation, children were asked the following questions:

1. What are natural resources?
2. Which natural resources do you know?
3. Should natural resources be preserved? Why?
4. Do you personally save natural resources? How?

Responses were evaluated on a 0–4 point scale:

- 0 points – no answer or incorrect answer;
- 1 point – partial or prompted answer;
- 3 points – correct but incomplete answer, given independently;
- 4 points – full, correct, and independent answer.

3.2. Picture-Based Tasks

Children were presented with a set of illustrated tasks, each allocated 30–60 seconds for completion. Questions included:

- What natural resource is shown in this picture? (one-word answer)
- What will happen if this natural resource disappears or becomes excessive?
- What should be done to prevent the disappearance of this natural resource?

Stimulating and guiding assistance was provided if the child struggled.

3.3. Diagnostic Observation

For one week, children's everyday actions were observed in relation to four domains of resource-saving:

- use of water,
- use of electricity,
- use of heat,
- waste disposal.

One point was awarded for each observed act of compliance with resource-saving practices.

4. Assessment Criteria

The levels of formation of a resource-saving culture were categorized as follows:

- **Very High (25–32 points):** Child answers quickly and correctly, demonstrates knowledge and consistent behaviors, concentrated and independent in tasks.
- **High (17–24 points):** Child possesses knowledge, answers most questions, but occasionally needs prompting; demonstrates partial adherence to rules.
- **Medium (9–16 points):** Child struggles to answer independently, requires constant stimulation, provides partial or incorrect answers, rarely demonstrates resource-saving behaviors.
- **Low (0–8 points):** Child cannot answer even with assistance, guesses randomly, shows almost no resource-saving behaviors.

5. Results

5.1. Responses to the Question "What are Natural Resources?"

This question posed considerable difficulty. Only 2 children in the experimental group and 3 in the control group answered independently at a very high level. Several children displayed high-level understanding with minor clarification from the researcher. The majority of children demonstrated only a medium level of comprehension, while 6 children in each group provided irrelevant or fantastical answers such as "a picture" or "a magic marker."

5.2. Quantitative Distribution of Knowledge Levels

Table 1. Children's knowledge levels for the question "What are natural resources?"

Level of knowledge	Experimental group (n=26)	Control group (n=26)
Very High	2	3
High	8	7
Medium	10	10
Low	6	6

The data are also illustrated in Figure 1 (bar chart).

5. Results (continued)

5.2. Responses to the Question "Which Natural Resources Do You Know?"

Children generally managed this task more easily than the previous one, yet the results were not particularly high. Many still required assistance from the researcher. In the control group, 35% of children achieved high and medium levels of knowledge, but only 4% demonstrated a very high level. In contrast, in the experimental group, 46% of children were at the medium level, 23% at the high level, and 8% at the very high level.

Table 2. Children's knowledge levels for the question "Which natural resources do you know?"

Level of knowledge	Experimental group (n=26)	Control group (n=26)
Very High	2	1

High	6	9
Medium	12	9
Low	6	7

Figure 2. Level of children's knowledge for the question "Which natural resources do you know?"

5.3. Responses to the Question "Should Natural Resources Be Preserved? Why Do You Think So?"

This question was aimed at revealing whether children understood the finite nature of natural resources and the need for their careful use. Many children showed signs of surprise, responding that "resources exist, so why should they be preserved?" This indicated a lack of awareness about scarcity and the importance of conservation. The majority of participants demonstrated a medium level of understanding. Only 2 children in the experimental group and 3 in the control group were able to answer affirmatively and provide arguments for the necessity of preserving resources.

Table 3. Children's responses to the question "Should natural resources be preserved? Why do you think so?"

Level of knowledge	Experimental group (n=26)	Control group (n=26)
Very High	2	3
High	6	7
Medium	11	12
Low	7	4

Figure 3. Children's responses to the question "Should natural resources be preserved? Why do you think so?"

5.4. Responses to the Question "Do You Save Natural Resources? How?"

This question aimed to assess children's personal attitude toward conservation and their readiness to perform simple but necessary actions for saving resources. The results showed that children in the experimental group achieved higher levels of formation of resource-saving culture compared to the control group. In the experimental group, 11 children were at medium and high levels, and only 2 were at a low level. In contrast, in the control group, more children remained at the low level, while fewer reached the high level.

Table 4. Children's responses to the question "Do you save natural resources? How?"

Level of knowledge	Experimental group (n=26)	Control group (n=26)
Very High	2	2
High	11	9
Medium	11	11
Low	2	4

Figure 4. Children's responses to the question "Do you save natural resources? How?"

5.5. Picture-Based Task: "What Natural Resource Is This? Name It in One Word"

This task required children to identify the natural resource shown in a picture and name it with one word. The control group experienced greater difficulties: 9 children could not cope with the task and demonstrated a low level. In the experimental group, only 2 children showed such difficulties. Most of the experimental group demonstrated medium-level results in distinguishing natural resources.

Table 5. Results of the task "What natural resource is this? Name it in one word"

Level of knowledge	Experimental group (n=26)	Control group (n=26)
Very High	1	2
High	7	9
Medium	15	6
Low	3	9

Figure 5. Results of the task "What natural resource is this? Name it in one word"

5.6. Picture-Based Task: "What Will Happen If This Natural Resource Disappears or Becomes Excessive?"

In this exercise, children were presented with a second set of pictures that required them to establish the logical consequences of resource disappearance or overabundance. This task was difficult for both groups: approximately 27% of children in both experimental and control groups showed low-level results. The distribution of responses was generally similar across groups: 31% of children demonstrated medium-level understanding, 27% high-level, and only 15% reached a very high level of logical reasoning.

Table 6. Results of the task "What will happen if this natural resource disappears or becomes excessive?"

Level of knowledge	Experimental group (n=26)	Control group (n=26)
Very High	[data from next block]*	[data from next block]*

Figure 6. Results of the task "What will happen if this natural resource disappears or becomes excessive?"

5.7. Picture-Based Task: "What Will Happen If This Natural Resource Disappears or Becomes Excessive?"

This exercise required children to establish logical cause-and-effect connections between the disappearance or excessive presence of a natural resource. Both groups faced difficulties: 27% of children in both the experimental and control groups demonstrated low-level results. Overall distributions were nearly identical between the two groups: 31% of children showed medium-level understanding, 27% high-level, and only 15% demonstrated a very high level of logical reasoning.

Table 6. Results of the task "What will happen if this natural resource disappears or becomes excessive?"

Level of knowledge	Experimental group (n=26)	Control group (n=26)

Very High	4	4
High	7	7
Medium	8	8
Low	7	7

Figure 6. Results of the task "What will happen if this natural resource disappears or becomes excessive?"

5.8. Picture-Based Task: "What Is the Best Way to Prevent the Disappearance of Natural Resources?"

In the final block of picture-based exercises, children were presented with illustrations of behaviors either leading to conservation or to the disappearance of resources. They were asked to select the appropriate behavior. This task proved difficult for 8 children in the experimental group and 7 in the control group, who all showed low-level results. Twelve children in each group demonstrated a medium level, while 6 children in the control group and 4 in the experimental group demonstrated a high level. Very few children reached the very high level.

Table 7. Results of the task "What is the best way to prevent the disappearance of natural resources?"

Level of knowledge	Experimental group (n=26)	Control group (n=26)
Very High	2	1
High	4	6
Medium	12	12
Low	8	7

Figure 7. Results of the task "What is the best way to prevent the disappearance of natural resources?"

5.9. Diagnostic Observation

The final stage of the diagnostic assessment involved structured observation of children's daily behavior in relation to resource-saving (water, electricity, heat, waste disposal). This allowed the researchers to determine real-life manifestations of resource-saving culture. The results indicated that for the majority of children, a resource-saving culture had not yet formed. Eleven children in the control group and eight in the experimental group demonstrated low-level results.

Table 8. Results of diagnostic observation of children's behavior

Level of knowledge	Experimental group (n=26)	Control group (n=26)
Very High	3	1
High	9	6
Medium	6	8
Low	8	11

Figure 8. Results of diagnostic observation of children's behavior.

5.10. General Results of the Diagnostic Study

Upon completion of the diagnostics, a general summary was compiled. The findings indicated that the two groups were at approximately equal levels of development, with differences being minor and statistically insignificant.

Table 9. Summary of diagnostics of the formation of a resource-saving culture

Level of knowledge	Experimental group (n=26)	Control group (n=26)
Very High	4	3
High	11	13
Medium	7	7
Low	4	3

Figure 9. Summary of diagnostics of the formation of a resource-saving culture.

6. Discussion

The diagnostic results show that children in both the experimental and control groups have similar levels of formation of resource-saving culture, with only slight differences. Most children demonstrated medium or low levels of knowledge and behavior regarding resource conservation. While some children were able to articulate the importance of resource-saving and demonstrate appropriate behavior, the majority lacked a deep understanding of the finiteness of natural resources and failed to consistently apply resource-saving practices in everyday life.

These findings align with previous studies in the field (Galkina, 2008; Klimkovich et al., 2003; Chabanenko, 2015), which emphasize that while preschool children are capable of acquiring basic knowledge about environmental conservation, systematic pedagogical methods are required to ensure the internalization of resource-saving habits. The results also indicate that picture-based tasks and structured observation are effective tools for identifying children's comprehension levels and practical behaviors.

Based on the conducted diagnostic study, it can be concluded that the current level of formation of a resource-saving culture among older preschool children is insufficient. Both experimental and control groups showed similar results, with the majority of children positioned at medium and low levels. These outcomes highlight the need for the development and implementation of specialized pedagogical methods and programs aimed at fostering resource-saving knowledge, attitudes, and behaviors during the preschool stage. Such interventions should combine cognitive, emotional, and practical components to ensure that children not only understand the importance of saving resources but also consistently demonstrate corresponding behaviors in daily life.

Findings

The study was conducted at the State Preschool Education Institution "Nursery–Kindergarten No. 244 of Minsk," involving 52 children from senior preschool groups divided into experimental and control cohorts. The diagnostic phase used three main tools: (1) a diagnostic conversation to assess children's knowledge of natural resources and awareness of the need for conservation; (2) tasks with pictures, adapted to children's visual-imaginative thinking, supported by oral explanations; and (3) purposeful diagnostic observations in a familiar environment to avoid stress or anxiety.

Key findings include:

- A significant proportion of children demonstrated only partial understanding of what natural resources are.
- Many children expressed awareness of the importance of saving resources but lacked consistent behavioral readiness to apply this understanding.

- A smaller group of children showed clear readiness to engage in resource-saving practices, which correlated with prior exposure to environmental education at home or preschool.

The data indicate that the formation of resource-saving culture in preschool children is uneven and requires systematic pedagogical interventions. This confirms the need for integrated educational programs that develop both cognitive awareness and practical behavioral skills.

7. Conclusion

The present study has provided a comprehensive diagnostic analysis of the level of formation of a resource-saving culture among older preschool children. The results obtained demonstrate that, despite the increasing global importance of rational resource use, the culture of resource conservation is not yet sufficiently developed at this age stage. Both the experimental and control groups revealed comparable outcomes, with the majority of children displaying medium and low levels of knowledge and behavior regarding natural resource conservation. Only a small proportion of participants were able to independently articulate the concept of natural resources, justify the need for their preservation, and demonstrate consistent resource-saving behaviors in everyday activities.

The findings suggest that the preschool period, while recognized as a critical stage for the formation of personality traits and social behaviors, currently lacks systematic and targeted pedagogical interventions aimed at instilling a culture of resource-saving. The difficulty that many children encountered in tasks requiring logical reasoning (e.g., predicting the consequences of resource depletion or selecting behaviors that promote conservation) highlights the necessity of developing age-appropriate didactic tools. Furthermore, the results of diagnostic observation confirmed that, although children may express partial awareness in structured settings, their spontaneous behaviors often fail to reflect sustainable practices, reinforcing the need for continuous educational reinforcement.

From a theoretical perspective, the outcomes confirm the relevance of integrating economic and ecological education into early childhood pedagogy, as emphasized by both classical thinkers (Aristotle, Xenophon, Plato) and modern researchers in psychology and pedagogy. The close relationship between individual economic maturity and societal development underscores the importance of beginning resource-saving education as early as preschool. Without a deliberate and consistent methodological framework, children's understanding remains fragmented, and their behaviors inconsistent.

From a practical standpoint, the study underscores the urgent requirement to design and implement specialized educational programs that combine cognitive, emotional, and behavioral components of resource-saving. Such programs should employ interactive, visual, and activity-based learning methods to match the developmental characteristics of preschool children. In addition, cooperation between families and preschool institutions is essential to ensure that the principles of resource conservation are consistently modeled and reinforced in both educational and home environments.

In conclusion, the diagnostic study clearly indicates that while preschool children demonstrate potential for developing a resource-saving culture, their current level remains inadequate. The results justify the need for the creation of targeted pedagogical strategies, methodological guidelines, and diagnostic tools to promote sustainable attitudes and behaviors. This will contribute not only to the personal development of children but also to the long-term formation of environmentally responsible citizens, capable of addressing the ecological and economic challenges of the modern world.

Ethical Considerations

The study adhered to ethical principles of pedagogical research. Participation was voluntary, and informed consent was obtained from the children's parents or legal guardians. The diagnostic activities were conducted in a familiar and supportive environment to avoid stress, fear, or discomfort. Confidentiality of personal data was ensured, and the study design prioritized the psychological well-being of all participants.

Funding

This research did not receive any specific grant from funding agencies in the public, commercial, or not-for-profit sectors.

Acknowledgments

The authors express their gratitude to the administration and staff of State Preschool Education Institution "Nursery–Kindergarten No. 244 of Minsk" for their cooperation and support in conducting the research, as well as to the children and their families for their participation.

Conflict of Interest

The authors declare no conflict of interest.

Issue web link https://imcra-az.org/archive/385-science-education-and-innovations-in-the-context-of-modern-problems-issue-11-vol-8-2025.html

Keywords Public expenditures; investment expenditures; economic growth; ARDL model; Algeria

Abstract

This study examines the dynamic relationship between investment expenditures and economic growth in Algeria over the period 1992–2022. The research highlights the strategic importance of investment spending in resource-dependent economies and situates Algeria's fiscal trajectory within broader theoretical frameworks, including classical and endogenous growth models.

Methodologically, the study employs the Autoregressive Distributed Lag (ARDL) model to assess both the short-run and long-run linkages between investment expenditures and gross domestic product (GDP) growth. The results reveal a statistically significant positive relationship: a 1% increase in investment expenditures is associated with a 0.11% rise in GDP growth. The findings demonstrate long-run complementarities between investment policies and sustainable growth, alongside short-run adjustments that reflect gradual transmission of expenditure shocks to growth outcomes.

The policy implications underscore the necessity for Algeria to consolidate stable investment frameworks, strengthen resource allocation efficiency, and pursue economic diversification beyond hydrocarbons. Investment in infrastructure, human capital, and technological capacity is identified as a critical pathway toward resilience against external shocks and sustainable development.

1. Introduction

Economic growth represents one of the most critical indicators of a nation's economic performance, standard of living, and development trajectory. Consequently, it has been the focal point of extensive research exploring determinants and policy levers. Among these, public expenditures constitute a fundamental fiscal instrument influencing growth, though their impact varies depending on country-specific structures and resource bases.

In Algeria, successive governments have adopted large-scale expenditure programs to stimulate growth and reduce structural vulnerabilities. These initiatives reflect both developmental imperatives and the challenges of a hydrocarbon-dependent economy. Against this backdrop, this study addresses the following central research question:

How do investment expenditures affect economic growth in Algeria during the period 1992–2022?

To guide the investigation, three sub-questions are posed:

1. What are the classifications of public expenditures in Algeria?
2. To what extent have investment expenditures contributed to economic growth?
3. What is the nature of the relationship between investment expenditures and growth in the Algerian context?

The objectives are fourfold:

- To delineate the theoretical foundations of public expenditures and economic growth.
- To classify and analyze public expenditures in Algeria.
- To quantify the impact of investment expenditures on economic growth between 1992–2022.
- To provide policy insights for future fiscal planning.

The remainder of the article is structured as follows. Section 2 reviews the conceptual underpinnings of public and investment expenditures. Section 3 presents the methodological approach, including the ARDL framework. Section 4 discusses the empirical results. Section 5 outlines policy implications, while Section 6 concludes.

2. Conceptual Framework: Investment Expenditures and Economic Growth

2.1 Public Expenditures

Public expenditures are generally defined as the financial resources disbursed by the state or its institutions to meet collective needs and promote socio-economic objectives. They represent cash outflows from the state treasury authorized by legislative bodies to provide public goods and services (Mustafa, 2007). Scholars emphasize that such expenditures embody both economic and social dimensions, aiming to secure public welfare and stimulate development (Mokhtari & Haddad, 2021; Youcef, 2023).

Over time, public expenditures have displayed a tendency to increase, driven by multiple factors: expansion of public sector activities, higher spending on housing, education, health, and social protection; subsidies for production and consumption; rising public sector wages; increasing defense budgets; and the burden of debt servicing (Lahcen, 2013).

2.2 Classification of Public Expenditures

No single classification system applies universally, as countries adopt varied approaches depending on policy priorities and institutional contexts (Youcef, 2023). Commonly, expenditures are categorized as follows:

- **By purpose:**
    - Administrative expenditures: resources allocated to the functioning of state institutions.
    - Social expenditures: transfers aimed at social welfare, including subsidies and pensions.
    - Economic expenditures: investments targeting economic activity and production.
- **By recurrence:**

- Regular expenditures: periodic allocations such as salaries, maintenance, and social services.
- Extraordinary expenditures: irregular spending, including large-scale investment projects or disaster responses.

- **By economic impact:**
  - Current expenditures: recurrent spending necessary for public administration.
  - Capital expenditures: outlays that contribute to capital formation and production capacity, including infrastructure and investment projects.

2.3 Investment Expenditures and Growth

Investment expenditures, as a subset of public spending, are particularly significant in growth theory. According to classical and Keynesian perspectives, such expenditures stimulate aggregate demand and employment, while endogenous growth models highlight their role in fostering innovation, human capital, and long-term productivity.

In Algeria, investment expenditures have historically focused on infrastructure, housing, and industrial development, serving as a mechanism for diversifying the economy beyond hydrocarbons. Their effectiveness, however, depends on institutional efficiency, governance, and the absorptive capacity of the domestic economy.

2.1.2 Classification of Public Expenditures in Algeria

The classification of public expenditures in Algeria has evolved through successive financial legislations, reflecting institutional reforms and shifts in fiscal governance.

a) Classification under Law 84-17 (1984)

According to Article 20 of Finance Law No. 84-17, public expenditures were initially classified into **management expenditures** and **equipment (investment) expenditures**.

- **Management expenditures** (Article 24) included:
  - Public debt burdens and deductions from revenues.
  - Allocations of public authorities.
  - Expenditures related to operating resources.
  - Public interventions.
- **Equipment (investment) expenditures** (Article 35) comprised:
  - Direct investments undertaken by the state.
  - Investment subsidies granted by the state.
  - Other capital-related expenditures.

This classification reflected Algeria's early post-independence development policies, which emphasized centralized planning and state-led industrialization.

b) Classification under Law 18-15 (2018)

Following the 2018 budgetary reform, Finance Law No. 18-15 introduced a more modern classification system, aligning Algeria with international standards of fiscal transparency and performance-based budgeting. Expenditures are now categorized by:

- **Activity:** encompassing programs and their subdivisions.
- **Economic purpose:** including chapters and sections of expenditure.
- **Major state functions:** assigning responsibilities to specific sectors.
- **Administrative responsibility:** distribution of appropriations among ministries and institutions.

Article 29 further details the composition of economic expenditures, which include: user expenses, management expenses, investment expenses, transfer payments, public debt servicing, financial operations, and contingency expenditures.

2.2 Economic Growth

Economic growth is broadly defined as a sustained increase in a country's gross domestic product (GDP), accompanied by improvements in real per capita income (Dardouri & Sararma, 2021). More specifically, it reflects an expansion of productive capacity through increased resource utilization, technological progress, and structural transformation (Mohammed, 2023).

2.2.1 Types of Economic Growth

According to Hafsi (2022), economic growth can be categorized into three main types:

- **Natural growth:** evolving through historical processes, e.g., transitions from feudalism to capitalism.
- **Transient growth:** driven by temporary or external shocks, such as resource booms, that dissipate over time.
- **Planned growth:** stemming from deliberate national development strategies, dependent on planning efficiency, institutional capacity, and broad societal participation.

2.2.2 Determinants of Economic Growth

Key determinants of growth include (Abdullah & Chikhaoui, 2022):

- **Labor:** the quantitative and qualitative contribution of the workforce, influenced by demographics and productivity.
- **Capital:** accumulation and effective utilization of physical, financial, and human capital resources.
- **Technological development:** the most critical determinant, facilitating innovation, efficiency, and competitiveness across sectors.

3. Relationship Between Investment Expenditures and Economic Growth in Algeria

3.1 Model Specification

To empirically assess the link between investment expenditures and economic growth in Algeria (1992–2022), the study employs the **Autoregressive Distributed Lag (ARDL)** framework introduced by Pesaran et al. (2001). This approach is particularly suitable for small-sample studies involving mixed integration orders [I(0) and I(1)].

The analysis draws upon annual data from the Bank of Algeria and the World Bank, ensuring robustness and comparability. The ARDL model specification is expressed as:

ΔYt=α+∑i=1pβiΔYt−i+∑j=0qγjΔXt−j+ϕYt−1+θXt−1+εt\Delta Y_t = \alpha + \sum_{i=1}^{p}\beta_i \Delta Y_{t-i} + \sum_{j=0}^{q}\gamma_j \Delta X_{t-j} + \phi Y_{t-1} + \theta X_{t-1} + \varepsilon_tΔYt=α+i=1∑pβiΔYt−i+j=0∑qγjΔXt−j+ϕYt−1+θXt−1+εt

Where YtY_tYt represents GDP growth, XtX_tXt represents investment expenditures, and the coefficients capture both short-run and long-run relationships.

3.2 Empirical Results

3.2.1 Unit Root Test

Prior to estimation, the stationarity of the time series was tested using the **Phillips–Perron (PP) test**. Results (Table 1) indicate that both GDP and investment expenditure series are **non-stationary at levels** but become **stationary at first differences**, implying integration of order I(1).

Table 1. Unit Root Test Results (Phillips–Perron Test)

Variables	At Level I(0) (No const., No trend)	At Level I(0) (Const.)	At Level I(0) (Const. & Trend)	At First Diff. I(1) (No const., No trend)	At First Diff. I(1) (Const.)	At First Diff. I(1) (Const. & Trend)	Result
LGDP	1.5229 (0.9654)	-1.0547 (0.9203)	-0.9748 (0.7492)	-3.5730 (0.0009)	-4.3654 (0.0088)	-4.0767 (0.0038)	I(1)
LINVEXP	1.8019 (0.9803)	-1.0061 (0.9281)	-1.5853 (0.4775)	-4.3819 (0.0001)	-4.8447 (0.0028)	-4.7328 (0.0007)	I(1)

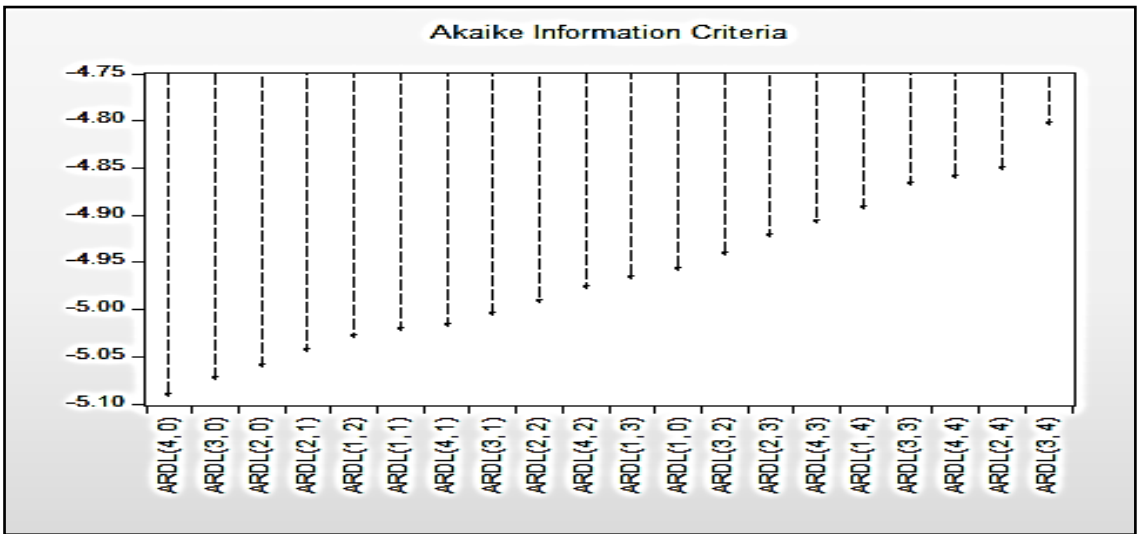
Note: Probability values in parentheses; Source: Author's calculations using EViews 10.

These results satisfy the ARDL preconditions, allowing estimation with a mixture of I(0) and I(1) variables.

3.2.2 Lag Selection

Optimal lag selection was determined using the **Akaike Information Criterion (AIC)**. As shown in Figure 1, the ARDL(4,0) specification yielded the lowest AIC value, confirming its suitability for modeling the dynamic relationship.

Figure 1: : Results of The Optimal Lag periodsTest



Source: Eviews 10 output

3.2.3 Cointegration Test Using the Bounds Approach

To determine whether a long-run equilibrium relationship exists between investment expenditures and economic growth, the **Bounds cointegration test** was applied. The results, presented in Table 2, show that the calculated F-statistic (7.124696) exceeds the upper and lower critical values at the 1%, 2.5%, 5%, and 10% significance levels. Accordingly, the null hypothesis of no cointegration is rejected in favor of the alternative, confirming the existence of a **long-run equilibrium relationship** between the dependent and independent variables.

Table 2. Bounds Cointegration Test Results

Test Statistic	Value	K
F-Statistic	7.124696	1

Significance Level	I(0) Bound	I(1) Bound
10%	3.02	3.51
5%	3.62	4.16
2.5%	4.18	4.79
1%	4.94	5.58

Source: Author's calculations using EViews 10.

3.3 Long-Run and Short-Run Relationship Estimates

3.3.1 Long-Run Relationship

Table 3 reports the long-run coefficients estimated under the ARDL model. The results confirm a **positive and statistically significant effect** of investment expenditures on economic growth. Specifically, a 1% increase in investment expenditures leads to a 0.11% increase in GDP. While the coefficient is modest, it demonstrates that investment spending in Algeria contributes to income expansion and long-term growth dynamics.

Table 3. Long-Run Relationship Estimates

Variable	Coefficient	SE	T-Statistic	Probability
LINVEXP	0.119017	0.007921	15.02571	0.0000
Constant	12.06594	0.058248	207.1488	0.0000

Source: Author's calculations using EViews 10.

3.3.2 Short-Run Relationship

Table 4 presents the short-run dynamics derived from the error correction representation of the ARDL model. The coefficient of the error correction term (CointEq(-1)) is **negative and statistically significant (-0.5935; $p < 0.01$)**, confirming the existence of an adjustment mechanism. This implies that approximately 59.35% of short-term disequilibria are corrected each year to restore the system to long-run equilibrium.

By contrast, investment expenditures exert no statistically significant effect on growth in the short run, underscoring the delayed nature of investment payoffs in the Algerian context.

Table 4. Short-Run Relationship Estimates

Variable	Coefficient	SE	T-Statistic	Probability
D(LGDP(-1))	0.248729	0.143000	1.739366	0.0966
D(LGDP(-2))	0.099747	0.154316	0.646385	0.5250
D(LGDP(-3))	0.285264	0.174389	1.635787	0.1168
CointEq(-1)	-0.593524	0.122671	-4.838350	0.0001

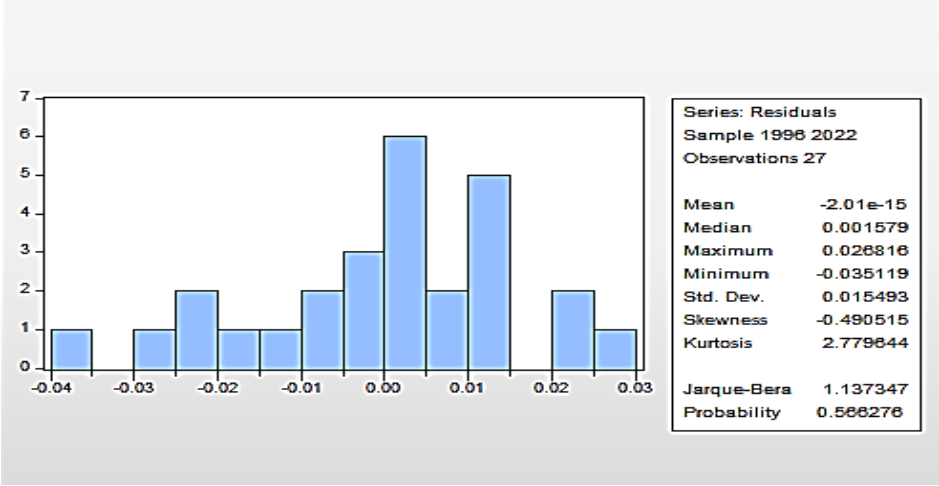
Source: Author's calculations using EViews 10.

3.4 Diagnostic Tests

3.4.1 Normality of Residuals

The **Jarque–Bera (JB) test** was applied to evaluate the normality of the residuals. Figure 2 illustrates that the JB statistic (1.13) is lower than the χ^2 critical value (5.99) at the 5% significance level. Furthermore, the probability value (0.56) exceeds the conventional thresholds, confirming that the model residuals are **normally distributed**, thereby satisfying one of the core assumptions of the ARDL framework.

Figure 2: Results Test of the normality distribution of residuals



Source: Eviews 10 output

3.4.2 Autocorrelation Test of Errors

The Breusch–Godfrey LM test was employed to detect the presence of serial correlation in the residuals. As reported in Table 5, the F-statistic (0.279386) and the Chi-square probability (0.6800) both exceed the 5% significance level. Therefore, the null hypothesis of no autocorrelation cannot be rejected, confirming that the model residuals are **free from serial correlation.**

Table 5. Autocorrelation Test of Errors (LM Test)

Test Statistic	Value	df	Probability
F-Statistic	0.279386	(2,19)	0.7593

Test Statistic	Value	df	Probability
Obs*R-squared	0.771361	(2)	0.6800

Source: Author's calculations using EViews 10.

3.4.3 Heteroskedasticity Test

The Breusch–Pagan–Godfrey test was applied to examine the homoscedasticity of residuals. The results in Table 6 indicate that the F-statistic (0.373600) is statistically insignificant (p = 0.8610), suggesting the absence of heteroskedasticity. Thus, the model satisfies the assumption of constant variance in the residuals.

Table 6. Heteroskedasticity Test Results (Breusch–Pagan–Godfrey)

Test Statistic	Value	df	Probability
F-Statistic	0.373600	(5,21)	0.8610
Obs*R-squared	2.205525	(5)	0.8200

3.4.4 Structural Stability Test

To evaluate the stability of the estimated parameters over the sample period, the **CUSUM and CUSUM of Squares** tests were conducted. Figure 3 illustrates that the plots remained within the 5% critical bounds, thereby confirming that the model is **structurally stable** and reliable for inference throughout the study period.

Figure 3: Structural Stability Tests – CUSUM and CUSUMSQ Plots

4. Conclusion and Policy Recommendations

This study analyzed the dynamic impact of investment expenditures on economic growth in Algeria for the period 1992–2022 using the **Autoregressive Distributed Lag (ARDL)** approach. Several conclusions emerge:

1. **Model reliability:** Diagnostic tests (normality, autocorrelation, heteroskedasticity, and stability) confirm the robustness and validity of the estimated ARDL model.

2. **Error correction mechanism:** The negative and statistically significant coefficient of the error correction term (-0.5935) indicates that approximately 59.35% of disequilibria are corrected annually, ensuring a rapid return to long-run equilibrium.

3. **Long-run effect:** Investment expenditures exert a positive and statistically significant effect on economic growth. A 1% increase in investment expenditures raises GDP by 0.11%. However, the elasticity is relatively weak, underscoring the need for complementary growth-enhancing policies.

4. **Short-run effect:** No statistically significant relationship was found between investment expenditures and growth in the short run, reflecting the delayed realization of investment benefits in Algeria's economy.

Policy Recommendations:

- Rationalize investment expenditures, prioritizing sectors with higher productivity and stronger growth spillovers (infrastructure, education, and technology).

- Strengthen oversight and accountability mechanisms to ensure efficient allocation and disbursement of public resources.

- Promote economic diversification by reducing overreliance on hydrocarbons and channeling investments into non-oil sectors.

- Improve institutional quality and governance to enhance the multiplier effect of public investment.

5. Findings

1. **Positive Long-Run Relationship:** Investment expenditures were found to have a long-run elasticity of 0.11, confirming their contribution to Algeria's GDP performance.

2. **Short-Run Dynamics:** Short-run effects are limited, though the strong error correction mechanism ensures that shocks are quickly corrected.

3. **Policy Implications:** Effective resource allocation, diversification of investment, and institutional reforms are required to amplify the modest long-run impact of investment on growth.

Funding

This research did not receive any specific grant from funding agencies in the public, commercial, or not-for-profit sectors.

Ethical Considerations

This study relies exclusively on secondary macroeconomic data sourced from publicly accessible databases, including the World Bank, the Bank of Algeria, and the International Monetary Fund (IMF). No human or animal subjects were involved, and therefore ethical approval was not required. All data sources are properly acknowledged and cited.

Acknowledgments

The author expresses gratitude to colleagues at the University of Biskra for their insightful feedback on the econometric framework and research design. Sincere appreciation is also extended to the anonymous reviewers for their valuable comments, which significantly improved the quality of this manuscript.

Conflict of Interest

The author declares no conflicts of interest regarding the publication of this study.

Keywords Administrative oversight, organizational efficiency, human resources management, governance, sports institutions, Algeria.

Abstract

Administrative oversight constitutes a cornerstone of effective governance and performance enhancement in public institutions, particularly within the sports sector, where resource optimization, human capital management, and transparency are critical. This study investigates the role of administrative oversight in developing organizational efficiency in the Directorate of Youth and Sports of Biskra. Employing a descriptive-analytical approach, the research relied on a structured questionnaire distributed to a randomly selected sample of 35 employees working within the directorate.

The results underscore the significant role of administrative oversight in improving organizational performance across several dimensions. Oversight mechanisms positively influenced decision-making accuracy, improved coordination between administrative units, and strengthened governance practices. Furthermore, the findings highlight the capacity of oversight to enhance organizational adaptability to internal and external challenges, thereby reinforcing institutional resilience. However, challenges persist in reducing resource misallocation and promoting transparency in reporting mechanisms.

The study concludes that strengthening oversight practices through digital tools, systematic employee training, and flexible procedural mechanisms are imperative for advancing organizational efficiency. The results provide both theoretical insights into the relationship between oversight and efficiency, as well as practical recommendations for policymakers and institutional leaders seeking to reinforce accountability and optimize performance in sports institutions.

1. Introduction:

Administrative control is a cornerstone of effective organizational management, operating synergistically with planning, organizing, and directing to form an integrated framework that ensures the efficient and effective attainment of organizational objectives. In recent decades, administrative control has undergone significant qualitative evolution, transitioning from its traditional role of performance monitoring and deviation detection to a strategic mechanism that enhances institutional performance, improves operational quality, and supports the implementation of modern governance principles.

The contemporary administrative landscape is characterized by rapid transformations driven by technological advancements, intensified competition, and evolving societal expectations. These dynamics necessitate the adoption of adaptive, flexible, and proactive control systems capable of addressing emerging challenges and mitigating potential risks. Such systems are critical for organizations to maintain resilience and achieve strategic goals in an increasingly complex environment.

Sports institutions are particularly significant due to their multifaceted contributions to public health, social development, and economic and athletic achievements at both local and global levels. Beyond their traditional recreational role, sports organizations have emerged as a global industry, bolstering national identity, enhancing quality of life, and attracting investment opportunities. However, these institutions face complex challenges, including financial constraints, limited managerial expertise, frequent legislative changes, and growing societal expectations for exceptional performance. These pressures underscore the need for a critical reevaluation of conventional management practices and the adoption of modern, evidence-based managerial models grounded in transparency, innovation, and operational efficiency (Charifi & Al-Aidani, 2017).

Organizational efficiency is a critical determinant of success for sports institutions, reflecting their ability to achieve objectives with minimal resource expenditure while maximizing quality. This is accomplished through the optimal allocation of human and material resources, the refinement of internal processes, and enhanced coordination among organizational units. Efficiency is pivotal in enabling institutions to adapt to environmental changes, meet societal expectations, and ensure sustainability in increasingly competitive contexts. Within this framework, administrative control serves as a vital mechanism for enhancing efficiency by monitoring performance, optimizing resource utilization, and addressing deviations. These functions collectively improve managerial quality, enhance decision-making, and foster innovation within the institution (Al-Munif, 1983, p. 350).

Administrative control in sports institutions is inherently multidimensional, encompassing financial performance monitoring, evaluation of human competencies, assessment of coordination among administrative structures, and assurance of compliance with legal and ethical standards. For example, effective administrative oversight can strengthen financial management in sports clubs by minimizing waste and enhancing fiscal sustainability. Similarly, it supports coaches and administrators in achieving athletic and organizational goals through constructive feedback and strategic decision-making guidance. However, the effectiveness of administrative oversight hinges on adopting a balanced approach that prioritizes improvement and development over punitive measures. This requires scientifically grounded and methodical strategies to ensure the attainment of desired outcomes (Boussak et al., 2021).

Sports institutions face mounting challenges, including inadequate infrastructure, shortages of qualified personnel, and fluctuations in funding and sponsorship policies. These issues necessitate the redesign of oversight systems to be more adaptive and responsive. Traditional control mechanisms, which primarily focus on error detection, are often inadequate in dynamic environments that require proactive problem-solving and innovative solutions. Consequently, this study investigates the relationship between administrative control and organizational efficiency in sports institutions, with a focus on how control systems enhance organizational performance, improve managerial quality, and promote institutional sustainability within a complex and competitive sports landscape.

The central research question is: To what extent can current oversight systems effectively address organizational needs and enhance efficiency in sports institutions? Many sports institutions rely on traditional regulatory models that emphasize punitive measures over constructive guidance, limiting their capacity to improve performance and achieve sustainability. Moreover, the lack of adaptive and flexible control systems exacerbates challenges such as poor coordination among administrative units, inefficient resource utilization, and delayed decision-making. Thus, the research problem is articulated as follows: **To what extent does administrative control contribute to organizational efficiency in sports institutions, particularly in addressing the challenges of a dynamic and competitive environment?**

Building upon the central research problem, this study addresses the following subsidiary research questions:

- What are the regulatory systems currently implemented in sports institutions, and how do these systems influence organizational performance?
- What factors facilitate or impede the effectiveness of administrative control in enhancing organizational efficiency?
- How can administrative oversight strengthen transparency and governance within sports institutions?

Study hypotheses:

General Hypothesis: Administrative control significantly enhances organizational efficiency in sports institutions by optimizing resource utilization and improving operational performance.

Subsidiary hypotheses:

- Effective administrative control strengthens organizational efficiency in sports institutions by improving coordination and minimizing operational deviations.
- The effectiveness of administrative control depends on its flexibility and adaptability to dynamic environmental conditions.
- Regulatory systems that prioritize guidance and continuous monitoring enhance the quality of decision-making in sports institutions.

Objectives of the study:

- To analyze the role of administrative control in enhancing organizational efficiency within sports institutions.
- To evaluate the effectiveness of regulatory systems implemented in sports institutions in achieving organizational objectives.
- To identify key factors influencing the effectiveness of administrative control in sports institutions.
- To examine the relationship between administrative oversight and the quality of internal coordination and decision-making processes.

The importance of the study:

This study holds significant theoretical and practical value. Theoretically, it addresses a critical knowledge gap concerning the relationship between administrative control and organizational efficiency in sports institutions, an area that has received limited scholarly attention compared to other sectors. It also provides a conceptual framework to guide future research in sports management and organizational studies.

Practically, the study offers evidence-based recommendations for decision-makers in sports institutions to enhance organizational performance, promote transparency, and ensure long-term sustainability. Furthermore, it contributes to the development of modern, adaptive control systems that align with principles of good governance, innovation, and competitiveness in the sports sector.

2. Defining concepts and terms:

- **Administrative Control**: Administrative control is a core function of the administrative process, designed to monitor operations, evaluate actual performance against planned objectives, and apply control standards. This process identifies positive achievements to be reinforced and negative deviations requiring correction, thereby ensuring the attainment of organizational goals (Harim, 2010, p. 302).
  Procedurally: Administrative control refers to the systematic process of monitoring and evaluating organizational performance in sports institutions, comparing it with predetermined objectives, and implementing corrective measures to achieve these objectives efficiently and effectively.
- **Organizational Efficiency**: Organizational efficiency denotes the extent to which an organization optimizes its human, material, financial, and informational resources. For institutions seeking growth and development, efficiency entails ensuring the continuous and effective allocation of these resources to sustain operations (Al-Munif, 1983, p. 286).
  Procedurally: Organizational efficiency is the capacity of a sports institution to achieve its objectives with minimal resource expenditure and maximal quality through the optimal allocation of human and material resources, the enhancement of internal processes, and the improvement of coordination and decision-making.
- **Sports Institutions**: Sports institutions are organizational entities responsible for managing and promoting sports activities. They encompass human and material resources and administrative processes, including planning, organizing, evaluating, and controlling (Kashway, 2006, p. 12).

Procedurally: Sports institutions are operational frameworks, such as facilities, sports complexes, or organizations, that deliver sports activities and are managed by structured administrative systems comprising groups of individuals.

3. Previous Studies

Dheeb and Jahemi (2024)

Title: The Role of Administrative Control in Enhancing Organizational Performance
This study explored administrative control as a critical mechanism for ensuring organizational continuity, success, and effective performance, emphasizing the pivotal role of human resources in achieving organizational objectives. Employing a theoretical analysis, the study examined the relationship between administrative control and organizational performance. Findings indicated that administrative control enhances performance and discipline by establishing clear standards, measuring actual performance, analyzing deviations, and implementing corrective actions. The integration of technology into control systems was found to improve efficiency by reducing costs, saving time, and enabling digital management. The study concluded that administrative control enhances human resource efficiency and service quality, with technology serving as a supportive tool to increase speed and effectiveness. Recommendations included educating employees about the importance of oversight, providing training for effective control, and adopting flexible supervisory approaches to avoid rigidity, which may lead to employee resistance or reduced motivation (Dheeb & Jahemi, 2024).

Boussak et al. (2021)

Title: The Role of Management Control Systems in Improving the Administrative Performance of Sports Institutions in Algeria: A Field Study of Sports Facilities in M'sila Governorate
This study highlighted the significance of management control systems in sports facilities as mechanisms for enhancing administrative practices and achieving institutional objectives. Using a descriptive-analytical approach, the researchers conducted a comprehensive survey of 19 sports complexes in M'sila Governorate, collecting data via questionnaires. Results revealed that inadequate sports facilities negatively impact the effectiveness of monitoring systems and, consequently, employees' administrative performance. However, both traditional and modern monitoring tools significantly improved administrative performance despite operational challenges. The study emphasized the role of comprehensive information systems in enhancing data collection, processing, and storage, thereby improving performance. Periodic audits and updates to these systems were deemed essential for sustained effectiveness. Additionally, dashboards were identified as critical tools for communication and decision-making, directing administrative processes toward efficiency and effectiveness in Algerian sports institutions (Boussak et al., 2021).

Charifi and Al-Aidani (2017)

Title: The Impact of Administrative Control on the Job Performance of Youth Home Staff
This study investigated the influence of administrative control on the job performance of youth home staff, focusing on control practices, performance evaluation, and their effects on performance outcomes. Employing a descriptive method, the researchers surveyed 30 educators from youth homes in Bouira, Laghouat, and Ain Sefra governorates, using questionnaires and interviews analyzed with percentages and the Chi-square (χ^2) test. Results confirmed that administrative control significantly enhances job performance, with the method of oversight directly influencing outcomes. The study recommended establishing specialized committees to design regulatory structures, clarify control regulations, and oversee their implementation. It also emphasized the need for motivational supervisory approaches and increased awareness among educators about the importance of administrative control for improving management effectiveness and quality (Charifi & Al-Aidani, 2017).

Zedam (2011)

Title: The Impact of Administrative Control on Employee Performance Efficiency in Sports Facilities
This study examined the effect of administrative control on employee performance efficiency in sports facilities, utilizing a descriptive survey method. Conducted at the Martyr Hamlawi Sports Complex in Constantine, the research included all staff and workers. Findings revealed a positive relationship between systematically designed administrative control mechanisms and performance efficiency, particularly when controls were purposefully applied to achieve organizational objectives. However, excessive or indiscriminate control was found to negatively impact employee efficiency. The study underscored the importance of balanced control mechanisms to optimize performance in sports facilities (Zedam, 2011).

Commenting on previous studies:

The present study intersects with several prior studies in its focus, methodology, and research tools, reinforcing the credibility of its theoretical framework and methodological choices. It aligns closely with research examining the

role of administrative control in enhancing organizational performance, particularly through the integration of technology to improve control system effectiveness and flexibility. This aligns with the current study's emphasis on adaptive and efficient control systems in sports institutions (Dheeb & Jahemi, 2024).

Contextually, the study shares similarities with research investigating the impact of management control systems on sports facilities, which highlights the role of both traditional and modern control tools in enhancing administrative performance (Boussak et al., 2021). It also connects functionally with studies exploring administrative control's influence on job performance in youth homes, particularly regarding how control methods affect employee behavior and motivation—an aspect addressed in the present study's evaluation of control effectiveness in improving organizational efficiency (Charifi & Al-Aidani, 2017). Additionally, the study converges with research demonstrating that systematically designed administrative control, guided by clear objectives, positively impacts employee efficiency in sports facilities (Zedam, 2011).

Methodologically, the current study adopts a descriptive-analytical approach, consistent with the methodologies of the reviewed studies, which validates its suitability for investigating administrative phenomena related to organizational efficiency. The use of questionnaires for data collection further aligns with established research practices in this field, enhancing the study's methodological rigor.

However, the present study distinguishes itself through its specific focus on the relationship between administrative control and organizational efficiency within the Algerian context, via a field study conducted at the Directorate of Youth and Sports in Biskra Province. This localized, applied focus provides spatial specificity and originality, contributing uniquely to the literature on sports management.

4. Field Procedures of the Study

4.1 Survey Study

The preliminary survey aimed to assess the suitability of the research setting and validate the research instrument in relation to the study's objectives. This step sought to explore key aspects of the phenomenon under investigation. The survey involved semi-structured interviews with a purposive sample of five key stakeholders from the Directorate of Youth and Sports in Biskra Province, comprising four department heads and one sports inspector. Additionally, a questionnaire was distributed to this sample to collect their insights, suggestions, and perspectives on critical aspects of administrative control and organizational efficiency. The data collected were used to refine the research instrument, ensuring its alignment with the research questions and the accuracy of the information gathered.

4.2 Temporal and Spatial Domain

Spatial Domain: The field study was conducted at the headquarters of the Directorate of Youth and Sports in Biskra Province, Algeria.

Temporal Domain: The study was carried out from March 2025 to May 2025. During this period, the theoretical framework was developed concurrently with the fieldwork.

4.3 Methodology

A research method is defined as a systematic set of rules, procedures, and techniques designed to facilitate the discovery of truth with minimal effort (Marwan, 2000, p. 60).

This study adopted a descriptive-analytical approach to achieve its objectives and test its hypotheses. This approach is well-suited for examining phenomena by systematically collecting and analyzing data on their characteristics and dimensions, identifying influencing factors, and deriving generalizable conclusions (Othman, 1998, p. 29). It involves the rigorous collection, classification, analysis, and interpretation of data to describe and quantify the phenomenon under study (Bouhouche & Al-Dhunaybat, 2007, p. 139).

4.4 Study Population and Sample

The study population included all employees of the Directorate of Youth and Sports in Biskra Province. A random sample of 35 employees was selected for participation, with questionnaires distributed to collect data. The study examined specific demographic and professional characteristics of the participants, including gender, age, and job level, to ensure a comprehensive analysis of the research variables.

Distribution of the study sample by gender:

Table 1: Distribution of the Study Sample by Gender

Gender	Frequency	Percentage
male	23	65%
female	12	35%
Total	35	100%

Source: Prepared by researchers based on SPSS V 25 outputs

- Distribution of the research sample by age:

Table 2: Shows the distribution of the study sample by age

Age	Frequency	Percentage
30–20 years	06	17%
31–40 years	14	40%
40years and above	15	43%
Total	35	100%

Source: Prepared by researchers based on SPSS V 25 outputs

- Distribution of the research sample by job level:

Table 3: Distribution of the study sample by job level

Job Level	Frequency	Percentage
employee	21	60%
Head of Department	10	29%
inspector	04	11%
Total	35	100%

Source: Prepared by researchers based on SPSS V 25 outputs

5- Scientific Properties of the Study Tool (Psychometric Characteristics)

5.1 Study Tool (Questionnaire):

The study utilized a questionnaire as the primary data collection instrument. A questionnaire is defined as a structured set of questions designed to gather information on a specific topic or phenomenon from respondents (Othman, 1998, p. 45). The questionnaire was developed and refined through a preliminary survey and expert review to ensure clarity, relevance, and alignment with the study's objectives. It comprises three main axes:

1. Effectiveness of Administrative Control in Enhancing Organizational Efficiency
2. Flexibility of Administrative Control and Its Adaptation to Organizational Variables
3. Role of Administrative Control in Enhancing Decision-Making and Governance

- Validity and Reliability of the Study Tool

The initial version of the questionnaire was submitted to three expert referees specializing in the principles and science of physical and sports activities. The purpose of this review was to ensure the clarity, relevance, and suitability of each item in relation to its corresponding axis. Based on the referees' feedback, necessary adjustments were made to refine the phrasing and enhance the alignment of the statements with the study objectives. This process ensured that the questionnaire was clear, comprehensible, and appropriate for data collection.

The items were distributed across a three-point Likert scale, as follows:

Range of arithmetic mean	01 to 1.66	From 1.66 to 2.32	2.32 to 3
Degree of approval	Low	Moderate	High
Responsiveness	01	02	03

- Reliability (Pearson correlation coefficient):

between the total scores of the axes Table 4: Pearson correlation coefficient values

Pearson		Axis 2	Theme 3
Axis 1	**Pearson correlation coefficient**	0,936**	0,959**
	Itself.	0,000	0,000
Axis 2	**Pearson correlation coefficient**		0,911**
	Itself.		0,000
** The level of statistical significance of the correlation coefficient at: 0.01			

Source: Prepared by researchers based on SPSS V 25 outputs

The table demonstrates the Pearson correlation coefficients between the axes:

- Between Axis 1 and Axis 2: 0.936
- Between Axis 1 and Axis 3: 0.959
- Between Axis 2 and Axis 3: 0.911

All correlation coefficients are statistically significant ($p < 0.01$), with a significance level of 0.000 for all calculated coefficients, which is below the 0.01 threshold. These results indicate strong and acceptable correlations between the axes, reflecting a high degree of internal consistency among the questionnaire items. The proximity of

the coefficients to 1 further confirms that the statements are closely related and reliably measure the intended constructs.

- Consistency of the questionnaire:

The reliability of the questionnaire was assessed using Cronbach's alpha to evaluate internal consistency. The overall reliability coefficient for the entire scale was 0.90, indicating excellent internal consistency and confirming the questionnaire's stability and suitability for the study. Reliability coefficients for each axis are presented in the following Table

Table 5: Cronbach's Alpha Coefficients for Questionnaire Axes

axles	Cronbach's Alpha	Number of Items
The first axis: effectiveness of administrative control in enhancing ficiencyorganizational ef	0.745	05
The second axis: flexibility of administrative control and its adaptation to environmental variables	0.789	05
-The Third Theme: Role of Administrative Control in Enhancing Decision Making and Governance	0.823	05

Source: Prepared by researchers based on SPSS V 25 outputs

6- Presentation and discussion of the results

Table 6: Responses of the study sample on the first theme: the effectiveness of administrative control in enhancing organizational efficiency

Item / Statement	Agree	neutral	Disagree	Mean	SD	Degree of approval	Rank
1. Administrative control procedures help reduce the waste of financial and material resources in the Directorate.	23	8	4	2,55	0.700	High	5
	%65.7	%22.9	11.4				
2. Administrative control contributes to improving coordination between administrative and sports departments to achieve institutional goals.	26	6	3	2.66	0.581	High	2
	%74.3	%17.1	8.6%				
3. Regular oversight enhances the job performance of employees through clear directives.	24	7	4	2,57	0.698	High	4
	%68.6	%20	11.4%				
4. Administrative control reports provide accurate data to correct errors and improve organizational processes.	26	7	2	2,69	0.582	High	1
	%74.3	%20	5.7%				
5. Administrative control supports the achievement of the strategic objectives of the Directorate with high efficiency and lower cost.	25	6	4	2,60	0.694	High	3
	%71.4	%17.1	11.4%				
Overall Axis				2.61	/	High	/

Source: Prepared by researchers based on SPSS V 25 outputs

The arithmetic means for the five items range from 2.55 to 2.69, all within the "High" degree of approval (2.33–3.00), indicating strong agreement among employees that administrative control enhances organizational efficiency at the Directorate of Youth and Sports in Biskra Province. The low standard deviations (0.581–0.700) reflect homogeneity in responses, reinforcing the reliability and consistency of the data.

Item 4: Accuracy of Reports (M = 2.69, SD = 0.582, Rank 1): The highest mean underscores the critical role of accurate administrative control reports in correcting errors and improving organizational processes. This aligns with Charifi and Al-Aidani (2017), who highlighted the importance of reliable data for reducing deviations and enhancing performance. Item 2: Coordination Between Departments (M = 2.66, SD = 0.581, Rank 2): The high mean reflects employees' recognition of administrative control as a mechanism for fostering coordination

between administrative and sports departments, supporting Boussak et al. (2021), who emphasized internal integration in sports institutions. Item 5: Strategic Objectives (M = 2.60, SD = 0.694, Rank 3): This mean indicates employees' awareness of administrative control's role in optimizing resource utilization to achieve strategic objectives efficiently, consistent with Dheeb and Jahemi (2024), who linked control systems to strategic efficiency. Item 3: Job Performance (M = 2.57, SD = 0.698, Rank 4): The mean confirms that regular oversight enhances employee performance through clear directives, aligning with Zedam (2011), who noted the positive impact of systematic oversight on sports facility workers. Item 1: Resource Waste (M = 2.55, SD = 0.700, Rank 5): The lowest mean, though still within the high approval range, suggests challenges in implementing financial and material resource control, potentially due to limited technological infrastructure or staff training, as noted by Boussak et al. (2021).

The overall axis mean of 2.61 supports the first subsidiary hypothesis: "Effective administrative control improves organizational efficiency in sports institutions by enhancing coordination and minimizing deviations." The results reflect a strong positive evaluation of administrative control practices, yet they highlight the need for enhanced electronic control systems and specialized training to address challenges in resource management, ensuring more effective achievement of strategic objectives.

These findings are consistent with prior research. Charifi and Al-Aidani (2017) emphasized that administrative oversight improves organizational performance through accurate reporting and deviation reduction, while Dheeb and Jahemi (2024) underscored the role of technological integration in enhancing efficiency. Boussak et al. (2021) noted that limited resources in sports institutions can constrain control effectiveness, explaining the lower mean for Item 1. Zedam (2011) highlighted oversight's positive impact on employee performance but cautioned against overly rigid control mechanisms that may reduce motivation, suggesting the adoption of incentive-based approaches.

Table 7: Responses of the study sample on the second axis: the flexibility of administrative control and its adaptation to environmental variables

Item / Statement	Agree	neutral	Disagree	Mean	SD	Degree of approval	Rank
6. Administrative control relies on flexible performance indicators that adapt to changes in the work environment.	26 %74.3	7 %20	2 5.7%	2.68	0.581	High	2
7. Administrative control tools are updated periodically to keep pace with legislative and technological changes.	26 %74.3	7 %20	2 5.7%	2.70	0.583	High	1
8. Administrative control uses modern electronic systems to facilitate adaptation to interim objectives.	25 %71.4	6 %17.1	4 11.4%	2.62	0.694	High	3
9. Administrative control takes into account the different particularities of the departments and interests in the Directorate.	24 %68.6	7 %20	4 11.4%	2.56	0.698	High	5
10. Flexible management control allows for quick response to challenges without bureaucratic complexities.	25 %71.4	6 %17.1	4 11.4%	2.60	0.693	High	4
Overall Axis				2.63	/	High	/

Source: Prepared by researchers based on SPSS V 25 outputs

The arithmetic means for the five items range from 2.56 to 2.70, all within the "High" degree of approval (2.33–3.00), indicating strong agreement among employees that administrative control is flexible and adaptable to internal and external environmental variables at the Directorate of Youth and Sports in Biskra Province. The low standard deviations (0.581–0.698) reflect homogeneity in responses, reinforcing the reliability and consistency of the data.

Item 7: Updating Control Tools (M = 2.70, SD = 0.583, Rank 1): The highest mean underscores employees' strong awareness of the importance of periodically updating administrative control tools to align with

legislative and technological changes. This aligns with Dheeb and Jahemi (2024), who emphasized that technological integration enhances oversight flexibility and reduces costs. Item 6: Flexible Performance Indicators (M = 2.68, SD = 0.581, Rank 2): The high mean reflects recognition of dynamic mechanisms that allow control systems to adapt to changing work environment requirements, supporting Charifi and Al-Aidani (2017), who noted the role of accurate and up-to-date systems in enhancing flexibility. Item 8: Modern Electronic Systems (M = 2.62, SD = 0.694, Rank 3): This mean highlights the role of technology in facilitating adaptation to interim objectives, consistent with Dheeb and Jahemi (2024), who underscored technology's contribution to oversight flexibility. Item 10: Rapid Response to Challenges (M = 2.60, SD = 0.693, Rank 4): The mean indicates a positive perception of flexible control in addressing challenges without bureaucratic complexities, though some administrative obstacles persist, as noted by Zedam (2011), who recommended incentive-based approaches to avoid employee frustration. Item 9: Departmental Particularities (M = 2.56, SD = 0.698, Rank 5): The lowest mean, though still within the high approval range, suggests that administrative control could better account for the specific needs of different departments, potentially due to resource constraints, as highlighted by Boussak et al. (2021).

The overall axis mean of 2.63 supports the second subsidiary hypothesis: "The effectiveness of administrative control depends on its flexibility and ability to adapt to environmental changes." The results reflect strong institutional awareness of the importance of flexible administrative control, yet they highlight the need to strengthen electronic systems, reduce bureaucratic obstacles, and enhance adaptation to departmental particularities to improve alignment with regulatory and legislative changes.

These findings are consistent with prior research. Dheeb and Jahemi (2024) confirmed that integrating technology into oversight enhances flexibility and cost-efficiency, supporting the high ratings for Items 7 and 8. Charifi and Al-Aidani (2017) noted that accurate information systems bolster oversight flexibility, though challenges like resource limitations, as identified by Boussak et al. (2021), may explain the lower mean for Item 9. Zedam (2011) emphasized that systematic oversight boosts efficiency but cautioned against random application, aligning with the need to improve adaptation to departmental specificities and reduce bureaucracy.

Table 8: Responses of the study sample on the third theme: The role of administrative control in enhancing decision-making and governance

Item / Statement	Agree	neutral	Disagree	Mean	SD	Degree of approval	Rank
11. Administrative control provides accurate and up-to-date data that supports rational management decision-making.	26	7	2	2.68	0.581	High	2
	%74.3	%20	5.7%				
12. Administrative control contributes to improving the quality of decisions related to the management of sports resources and activities.	27	5	3	2.71	0.631	High	1
	%77.4	%14.3	8.6%				
13. Administrative control enhances transparency in the management of human and financial resources within the Directorate.	23	8	4	2.54	0.700	High	5
	%65.7	%22.9	11.4				
14. The results of management control are used to develop management policies that meet the needs of stakeholders.	25	6	4	2.60	0.694	High	3
	%71.4	%17.1	11.4%				
15. Administrative control supports the application of good governance principles to ensure the satisfaction of athletes and the community.	24	7	4	2.57	0.698	High	4
	%68.6	%20	11.4%				
Overall Axis				2.62	/	High	/

Source: Prepared by researchers based on SPSS V 25 outputs

The arithmetic means for the five items range from 2.54 to 2.71, all within the "High" degree of approval (2.33–3.00), indicating strong agreement among employees that administrative control enhances decision-making

and governance at the Directorate of Youth and Sports in Biskra Province. The low standard deviations (0.581–0.700) reflect homogeneity in responses, reinforcing the reliability and consistency of the data.

Item 12: Decision Quality (M = 2.71, SD = 0.631, Rank 1): The highest mean underscores employees' strong awareness of administrative control's role in improving the quality of decisions related to sports resource and activity management. This aligns with Dheeb and Jahemi (2024), who emphasized that oversight systems provide accurate data to rationalize strategic and daily decisions. Item 11: Accurate Data for Decision-Making (M = 2.68, SD = 0.581, Rank 2): The high mean highlights the importance of accurate and up-to-date control data in reducing randomness in administrative management, supporting Charifi and Al-Aidani (2017), who noted the role of micro-information systems in decision-making. Item 14: Developing Management Policies (M = 2.60, SD = 0.694, Rank 3): This mean reflects the strategic use of oversight results to develop policies meeting stakeholder needs, consistent with Boussak et al. (2021), who linked control outputs to improved public policies. Item 15: Good Governance Principles (M = 2.57, SD = 0.698, Rank 4): The mean indicates a positive perception of administrative control's role in supporting governance principles to ensure athlete and community satisfaction, though further institutionalization is needed, as suggested by Zedam (2011). Item 13: Transparency in Resource Management (M = 2.54, SD = 0.700, Rank 5): The lowest mean, though still within the high approval range, suggests challenges in implementing transparency, particularly in financial and human resource management, potentially due to limited resources, as noted by Boussak et al. (2021).

The overall axis mean of 2.62 supports the third subsidiary hypothesis: "Regulatory systems based on guidance and follow-up contribute to improving the quality of decision-making within sports institutions." The results reflect a strong positive evaluation of administrative control's role in enhancing decision-making and governance, yet they highlight the need to develop electronic information systems, improve transparency in financial and human resource management, and intensify training to support the institutionalization of good governance.

These findings are consistent with prior research. Dheeb and Jahemi (2024) confirmed that oversight enhances decision-making and governance through technological integration, supporting the high ratings for Items 11 and 12. Charifi and Al-Aidani (2017) noted that micro-information systems improve decision-making but highlighted resource constraints, aligning with the lower mean for Item 13. Boussak et al. (2021) emphasized challenges in resource-limited settings, explaining transparency issues. Zedam (2011) highlighted the positive impact of systematic oversight on efficiency but cautioned against unregulated implementation, supporting the need for improved transparency mechanisms and incentive-based approaches.

7- Conclusion:

The analysis of questionnaire data from a sample of employees at the Directorate of Youth and Sports in Biskra Province elucidates the pivotal role of administrative control in enhancing organizational efficiency across three dimensions: effectiveness, flexibility, and decision-making/governance. The findings across these dimensions substantiate the study's general hypothesis and highlight both strengths and areas for improvement.

The results of the first axis demonstrated the effectiveness of administrative control in fostering coordination between administrative and sports departments, providing accurate reports that facilitate error correction and operational improvements, and supporting the efficient achievement of strategic objectives. However, challenges in reducing financial and material resource waste underscore the need to strengthen financial control mechanisms and adopt advanced resource management tools.

The findings of the second axis affirmed the flexibility of administrative control, evidenced by the periodic updating of control tools to align with legislative and technological advancements, the adoption of dynamic performance indicators responsive to work environment demands, and the use of electronic systems to facilitate adaptation to interim objectives. Nonetheless, the results highlighted the necessity of greater consideration for the unique needs of various departments and the reduction of bureaucratic complexities that may impede rapid responses to emerging challenges.

The third axis underscored the role of administrative control in enhancing the quality of decisions related to sports resource and activity management, providing reliable data to support rational decision-making, and leveraging audit outcomes to formulate administrative policies that address stakeholder needs. Furthermore, control mechanisms significantly contributed to reinforcing good governance principles, promoting the satisfaction of athletes and the broader community. However, a relative shortfall in transparency, particularly in managing human and financial resources, indicates challenges that necessitate stronger institutionalization of accountability mechanisms.

Collectively, these findings confirm the validity of the general hypothesis: "Administrative control contributes to the development of organizational efficiency within sports institutions." Administrative control

enhances internal coordination, improves job performance, supports rational decision-making, and promotes effective governance. Nevertheless, the results emphasize the urgent need to address challenges related to reducing resource waste, enhancing transparency, and improving adaptation to departmental specificities to ensure the long-term sustainability of organizational efficiency in sports institutions.

Suggestions:

Based on the findings from the questionnaire data analysis conducted with employees at the Directorate of Youth and Sports in Biskra Province, the following proposals are recommended to strengthen the role of administrative control in enhancing organizational efficiency within sports institutions:

- Development of Electronic Control Systems: Implement advanced digital solutions and specialized software to monitor financial and human resources. These systems aim to enhance report accuracy, minimize resource waste, and ensure timely access to reliable data, thereby supporting operational efficiency and decision-making.
- Capacity-Building and Training: Organize ongoing training programs and periodic workshops for employees to enhance their proficiency in using electronic control tools. These initiatives should also deepen employees' understanding of governance principles to foster transparency, efficiency, and accountability.
- Design of Flexible Control Mechanisms: Develop adaptable control frameworks that account for the unique needs of various departments and activities. Such frameworks ensure alignment with diverse operational requirements and facilitate responsiveness to legislative, technological, and environmental changes.
- Enhancing Transparency and Accountability: Establish electronic dashboards for the regular publication of audit and performance reports. This initiative would bolster stakeholder trust, reinforce good governance practices, and institutionalize robust accountability mechanisms.
- Stakeholder Engagement: Conduct periodic surveys and consultations with administrators, athletes, coaches, and local community members to assess their satisfaction with management policies and governance practices. This approach promotes inclusive, stakeholder-responsive, and sustainable decision-making.
- Periodic Review of Management Policies: Implement systematic evaluations and updates of management policies within sports institutions to ensure alignment with the objectives of administrative control, organizational efficiency, and continuous improvement.

Findings

- Positive Influence on Decision-Making: Oversight practices contributed to the accuracy and timeliness of decisions, reducing administrative errors and delays.
- Improved Coordination: The mechanisms fostered integration and cooperation across departments, facilitating collective achievement of institutional objectives.
- Strengthened Governance: Oversight enhanced accountability and compliance, supporting sustainable institutional development.
- Adaptability: The presence of oversight enabled the institution to respond more effectively to environmental changes, both internal and external.
- Persistent Challenges: Despite these strengths, oversight mechanisms were less effective in addressing waste reduction and in promoting complete transparency across reporting systems.

Funding

This study was conducted with the institutional support of the Laboratory of Modern Sciences in Physical and Sport Activities, Institute of Science and Technology of Physical and Sport Activities, University of Bouira, Algeria. No external funding was received.

Ethical Considerations

The research was carried out in full compliance with academic ethical standards. Participation was voluntary, and all respondents provided informed consent prior to completing the questionnaire. Confidentiality and anonymity of participants were strictly preserved, and data were used solely for scientific purposes.

Acknowledgment
The authors express their gratitude to the Directorate of Youth and Sports of Biskra for facilitating the research process, as well as to the employees who willingly participated in the study. Special thanks are also extended to the University of Bouira for academic and logistical support.

Conflict of Interest
The authors declare no conflict of interest regarding the publication of this study.

Keywords higher education, stakeholder analysis, quality of education, educational program, strategic management, governance

Abstract
This article substantiates the necessity of implementing stakeholder analysis into the strategic management of higher education institutions (HEIs) to ensure and continuously improve educational quality. The study highlights the recognition of stakeholder concepts in education policy through the methodological frameworks developed by the National Agency for Higher Education Quality Assurance of Ukraine. It identifies fundamental differences between the strategic concepts applied to firms and those adapted to higher education, while assessing the substantive similarities between "quality of education" and "quality of educational programs." Document analysis and comparative methods were employed to evaluate the rational limits of stakeholder theory application in HEIs. Findings demonstrate that the integration of stakeholder perspectives strengthens accountability, promotes transparency, and enhances the legitimacy of higher education institutions in society. The research also identifies gaps in adapting classical stakeholder theory—originally developed for corporations—to the context of higher education, pointing to the need for flexible models that consider the multiplicity of stakeholders (students, faculty, employers, regulators, and local communities). The article concludes that stakeholder analysis has significant potential for advancing higher education quality strategies, provided it is adapted to educational contexts rather than directly transferred from corporate frameworks.

1. Introduction

An important direction in the development of organizational management theory, based on the value approach, has been the stakeholder theory of the firm. This concept has been positively received by scholars and practitioners across many spheres of public life and has been adopted by leading corporations, regulatory bodies, and non-profit organizations. A vast number of academic studies and practice-oriented publications have been devoted to its development. Persistent interest in this field of knowledge indicates, on the one hand, its theoretical and practical significance, and on the other, the certain incompleteness of the approach, which, despite its conceptual appeal and simplicity, requires deeper elaboration in practical application.

2. Aim of the Study

The objective of this study is to examine the analytical possibilities of stakeholder analysis in the field of higher education.

3. Materials and Methods

The theoretical foundation of the study is stakeholder theory and its operational tool—stakeholder analysis. To evaluate the rational boundaries of applying stakeholder analysis to higher education institutions (HEIs), the methods of document analysis and comparison were employed. Generalizations were derived from the authors' reasoning and interpretation.

4. Results and Discussion

4.1. The Emergence of Stakeholder Theory

The origins of stakeholder theory are associated with the pioneering monograph of R. E. Freeman *Strategic Management: A Stakeholder Approach* (1984) [1]. According to Freeman's definition, company stakeholders are "any individuals, groups, or organizations that can significantly affect, or are affected by, the firm's decisions" [1, p. 25]. His generalized list of stakeholders included owners, employees, consumers, competitors, suppliers, the state, and local community organizations. Consequently, corporate management, in proving its social responsibility and economic rationality, is expected to act in ways that satisfy—or at least do not infringe upon—the interests of stakeholders. Today, the stakeholder approach has become one of the dominant streams of strategic management, and its ideas and tools are widely employed in organizational governance. At the same time, within this branch of management, there remain "bottlenecks" that limit its effective application in other spheres of activity.

4.2. Strategic Context and Stakeholder Models in HEIs

A key problem in building applied models based on stakeholder analysis, in our view, lies in defining the strategic context of organizational activity. The correctness of the initial stages of stakeholder analysis—identifying stakeholders and formally describing their behavior—depends on this definition. When an organization makes a strategic decision, the justification of its appropriateness must include an assessment of the expectations of all interested parties. Strategic analysis methods grounded in stakeholder theory may thus prove useful in substantiating organizational goals, considering both their complexity and multidimensionality as well as the heterogeneity of stakeholders in terms of interest and influence. At the same time, stakeholder theory requires managers to regard stakeholders as an integral yet contradictory whole, where the balance of their interests defines the developmental trajectory of the organization. However, the theory also has certain limitations as an autonomous tool of organizational management.

4.3. Stakeholder Models in Educational Management

The application of stakeholder theory and its instruments in educational management significantly expands analytical capabilities, especially in light of the modern concept of ensuring and enhancing education quality. As O. V. Yeremenko has noted in the context of developing the National Agency for Higher Education Quality Assurance

(NAQA): "In documents concerning higher education quality, the concept of 'stakeholders'—the so-called interested parties—has already become common and frequently used" [2, p. 177].

In recent years, NAQA has focused on developing the normative base related to program accreditation. In 2019, NAQA developed the *Criteria for Assessing the Quality of Educational Programs*, later reflected in methodological guidelines for experts. These criteria are less formalized rules for program content and process than general provisions aimed at evaluating implementation practices. Their universality and flexibility are ensured by adherence to three principles: (i) respect for HEI autonomy, (ii) consideration of contextual conditions, and (iii) direct involvement of stakeholders [3]. Importantly, the guidelines state: *"Criteria can only be meaningfully applied in the context of stakeholder positions. It is stakeholder participation that enables an HEI to identify the environment in which it functions and to determine the requirements that define the quality of a specific educational program"* [3, sec. I].

As a result, in preparation for accreditation, many HEIs formalized relations between internal and external stakeholders by adopting "Regulations on Program Stakeholders" [4–6]. These documents defined stakeholders in education as direct participants in producing and consuming higher education outcomes (faculty, applicants, students, graduates, employers, and state institutions), as well as business structures, other HEIs, banks and financial institutions, sponsors, research funding organizations, media, civil associations, investors, recruitment agencies, publishers, and academic societies [4, p. 5].

4.4. The Strategic Context of Educational Quality

When defining the strategic context of HEIs through the prism of educational quality, i.e., continuous improvement of all processes, universities set wide-ranging development goals that account for diverse stakeholder needs. The list of relevant stakeholders is extensive: students and households, faculty and management, the state and local communities, employers, and external partners. Hence, universities realize their strategic goals primarily through the implementation of educational programs. In this sense, institutional stakeholders are transformed into program stakeholders.

This interpretation is supported by European recommendations on higher education reforms in Ukraine, which emphasize that educational programs should be developed in alignment with HEI strategy [7]. Yet, while valid, this recommendation requires further clarification within the framework of strategic management. Unlike corporate business units, educational programs are semi-virtual environments that are not always fully institutionalized. Faculty from different departments contribute to program delivery, but current labor law does not formalize their participation in program teams. Similarly, program guarantors perform managerial functions on a voluntary basis, often limited to program design and methodological oversight, while program implementation follows the general functional structure of the HEI.

Therefore, an educational program cannot, in our opinion, be regarded as a separate strategic unit of an HEI. Research analogies between the educational and business sectors, as well as direct application of strategic management tools, require more nuanced academic substantiation.

4.5. Beyond Program-Level Stakeholder Management

It is evident that stakeholders in higher education should be analyzed in the broader strategic context of ensuring and improving education quality. This corresponds with NAQA's methodological guidelines and aligns with the argument of S. M. Kvit, head of NAQA, who noted that accreditation should focus "not on the outcomes of the educational process, but on the process itself—that is, the capacity of HEIs to organize a high-quality educational process based on the principles of institutional autonomy" [8, p. 172].

Thus, the scope of stakeholder analysis and stakeholder management in higher education extends beyond individual educational programs. Programs, though strategic priorities, are inseparable from the institutional environment and from one another. This indicates a conceptual gap between "quality of education" and "quality of an educational program," as well as attempts to substitute one for the other.

Actuality of the Research

The actuality of this study arises from the ongoing transformation of higher education systems in Ukraine and globally, where the traditional models of governance, evaluation, and quality assurance are increasingly being replaced by approaches based on accountability, transparency, and stakeholder participation. The shift from a provider-centered to a stakeholder-centered paradigm reflects profound changes in the mission of universities, which are no longer regarded solely as knowledge producers, but also as service providers, societal partners, and key actors in national and regional development strategies.

In the global educational landscape, international organizations such as UNESCO, OECD, and the European Higher Education Area have emphasized the need for inclusive, responsive, and socially oriented education systems that actively engage diverse stakeholders. This requirement is particularly urgent in transitional economies, where higher education institutions (HEIs) face multiple challenges: the need to align academic programs with labor market demands, to meet international accreditation and ranking standards, and to justify their societal value in conditions of limited resources and intensified competition.

In Ukraine, the establishment of the National Agency for Higher Education Quality Assurance has formalized the role of stakeholder participation in accreditation, governance, and strategic management. However, while the term "stakeholder" is increasingly used in methodological and policy documents, its theoretical and applied integration into higher education practices remains incomplete. Stakeholder theory, originally developed for corporations, cannot be directly transplanted into the educational sphere without adaptation, since HEIs operate in a multidimensional environment with broader social and cultural missions. This creates both opportunities and risks: opportunities for expanding accountability and improving quality, and risks of misinterpretation, superficial formalization, or reductionism in applying business-based models to education.

The actuality of the present study also stems from the need to bridge the gap between theory and practice. While stakeholder analysis has become a standard tool in corporate strategic management, its systematic application in higher education remains fragmented and underexplored. For many HEIs, the stakeholder approach is still perceived as a formal requirement of accreditation rather than as an integrated strategic resource. A comprehensive scientific substantiation of the analytical possibilities of stakeholder theory in the higher education context is therefore essential for creating robust, evidence-based, and context-sensitive governance models.

In this sense, the research not only contributes to academic discourse but also offers practical insights for policymakers, administrators, and educators. By adapting the instruments of stakeholder theory to higher education, it becomes possible to enhance institutional autonomy, strengthen trust between HEIs and society, and ensure sustainable quality development in line with European and global standards.

Findings

1. **Adaptability of Stakeholder Theory:**
   While originally conceptualized in the corporate sector, stakeholder theory can be successfully adapted to higher education, provided that modifications are made to address its broader societal mission.

2. **Quality Assurance Perspective:**
   The concepts of "quality of education" and "quality of educational programs" are strongly interrelated. Stakeholder analysis offers practical tools for aligning institutional strategies with accreditation and quality assurance requirements.

3. **Stakeholder Diversity in HEIs:**
   Unlike firms, HEIs have a wider and more complex stakeholder base, including students, academic staff, government agencies, employers, professional associations, and society at large. Their diverse and sometimes conflicting expectations require balanced and transparent governance approaches.

4. **Policy Implications:**
   Methodological documents of the National Agency for Higher Education Quality Assurance acknowledge the

importance of stakeholder engagement. Their effective use can enhance legitimacy, accountability, and innovation in higher education policy and practice.

5. **Strategic Outcomes:**
   Universities that integrate stakeholder perspectives into their quality strategies demonstrate improved responsiveness to labor market demands, enhanced student satisfaction, and stronger institutional reputation.

Funding

This research did not receive any specific grant from funding agencies in the public, commercial, or not-for-profit sectors. The study was conducted within the framework of academic responsibilities of the authors and supported by their respective institutions.

Ethical Considerations

The study involved no human or animal participants, experiments, or personal data collection. All analyses were based on publicly available documents, policy frameworks, and theoretical literature. Ethical standards in academic writing and referencing were rigorously followed.

Acknowledgment

The authors express gratitude to the Kyiv National Economic University named after Vadym Hetman and the Public Organization *Club of Economists* for providing institutional support and access to relevant academic resources. Special appreciation is extended to colleagues and reviewers who offered constructive comments on earlier drafts of this work.

Conflict of Interest

The authors declare that there is no conflict of interest regarding the publication of this article.

Keywords scientific research, management of training programs, human resources, municipality.

Abstract
This research paper aims to study and analyze the role that scientific research can play in developing the management of training programs for human resources in the municipality, in light of contemporary developments that include the administrative, economic, social, and cultural fields, and their impact on the process of local development. Among the most important results reached is that the activation of scientific research requires adopting several mechanisms, the most important of which is activating the idea of community participation with the aim of providing real opportunities for local actors active in the field of scientific research to initiate their scientific efforts, establishing digital platforms to document and strengthen continuous communication and interaction between those managing municipal affairs and the scientific elite, in order to address development issues, including the issue of developing the management of training programs. Added to the above is also the necessity of adopting an artificial intelligence system under the supervision of actors active in the field of scientific research to contribute to rationalizing the management of training programs.

Introduction:

The human resources that perform their functional activity at the level of the municipality constitute a main component in the management of local affairs, considering the nature of the tasks they have become responsible for performing, such as planning, coordinating, and implementing policies and decisions. Among the most important forms of these resources are the locally elected members and public employees. In order for these categories to perform their tasks to the fullest, training programs must be organized periodically with the aim of developing their capacities in the fields they occupy.

In light of the continuous development witnessed in administrative and technical fields, in addition to the growing requirements of the local community and their increasing flow at higher rates, the matter requires adopting more effective approaches that make it possible to develop the content of training programs, and thereby contribute to developing their outcomes at the individual and institutional level. Scientific research is one of the most important approaches that can contribute to addressing this issue, given the standards it is characterized by, which include accuracy and objectivity. From this standpoint, we raise the following problem:

Problem:

What are the most important mechanisms that must be adopted to activate the role of scientific research in developing the management of training programs for human resources in the municipality?
Sub-questions:

1. What role does the idea of community participation play in activating the role of scientific research?
2. How does the digitization system contribute to documenting

communication between those managing municipal affairs and the actors active in the field of scientific research? And what are its implications for developing the management of training programs?

3. What is the importance of activating the artificial intelligence system in the management of training programs?

Study Hypotheses:

1. The higher the level of activation of community participation, the higher the level of activation of scientific research in the management of training programs.
2. The higher the level of reliance on digital platforms, the more it enhances the level of cooperation between those managing municipal affairs and local actors active in the field of scientific research.
3. The higher the level of activation of artificial intelligence, the greater the rationalization of training programs.

Study Methodology:

In order to address the raised problem and verify the validity of the hypotheses we formulated, we attempted to adopt the descriptive and analytical method, by employing the descriptive approach, which is one of the most important methods that helps to describe and diagnose the study variables and determine the relationship between them. We also tried to employ scientific research as an approach to developing the management of training programs.

Study Objectives:

Through this study, we seek to achieve a set of objectives, the most important of which are:

1. To determine the nature of the relationship between scientific research and the process of developing the management of training programs for human resources in the municipality.
2. To determine the most important mechanisms that can be adopted to activate the role of scientific research in preparing and managing training programs for human resources in the municipality.
3. To evaluate the extent of the contribution of scientific research to developing the management of training programs for human resources in the municipality.
4. To take the initiative in presenting a scientific vision that includes the most important mechanisms that would contribute to developing the process of training human resources in the municipality in light of contemporary development challenges.

Division of the Study:

In order to determine the nature of the relationship between the study variables, and thereby address the research problem, we divided this study according to the following plan:

- First axis: The theoretical rooting of the study concepts.
- Second axis: Mechanisms for documenting communication between scientific research and the process of managing training programs.

First Axis: The Theoretical Rooting of the Study Concepts

First: Scientific Research

Scientific research constitutes one of the most important responsibilities borne by the elites and competencies active at the level of universities, institutes, and centers of a scientific and technological nature, including professors, researchers, and students at various stages. Accordingly, we will attempt below to define the general meaning of scientific research.

1. Definition of Scientific Research:

"Scientific research is a systematic, controlled, empirical and critical investigation of natural phenomena guided by theory and hypothesis about the presumed relations among such phenomena."

"Scientific research is the process of investigating natural phenomena using the scientific method for the purpose of discovering new facts and developing scientific theory."

"Scientific research also aims at the review of facts, laws and theories in view of newly discovered facts, and the practical applications of such facts, laws and theories. Therefore, scientific research is the continuous search for knowledge and understanding of reality carried out through the scientific method. Its result is scientific knowledge." Some view scientific research as: "An organized scientific activity, a way of thinking, and a method of looking into phenomena and uncovering facts, relying on objective methods in order to understand the relationship between these facts, and then deriving interpretative principles and laws."

Thuraya Malhas defines it as: "A method of discovering, exploring, developing, testing, and verifying knowledge in a precise way, with deep critique, then presenting it in a complete manner with intelligence and awareness so that it proceeds within the path of global civilization, and contributes to it in a living and comprehensive way. But if research strays from this goal, it will not be given life, and the efforts expended for it will be wasted."

Based on the definitions previously presented, an operational definition can be proposed as follows:

Scientific research is an organized process based on specific standards, including accuracy, objectivity, and the avoidance of subjectivity and randomness. This process is undertaken by the competent entities possessing the necessary qualifications in scientific fields, such as professors, researchers, and students in the three stages (Bachelor's, Master's, Doctorate), with the aim of addressing various current and future phenomena, issues, and problems, in order to achieve comprehensive sustainable development.

2. Characteristics of Scientific Research:

Scientific research is characterized by a set of features, the most important of which are:

- It begins with raising a question or a set of questions in the researcher's mind about certain life issues and matters that provoke inquiry.
- Defining the problem and formulating it in specific terms with clear and uncomplicated scientific terminology.
- Establishing a plan that directs the researcher toward finding solutions to the raised problem.
- Scientific research addresses the main problem by raising sub-problems, and the solutions to the sub-problems constitute a solution to the main problem.
- The directions of scientific research are determined by hypotheses based on clear assumptions or premises.
- Scientific research is not limited to collecting known information, data, and facts only, but also to deriving new meanings, concepts, and interpretations that may differ among researchers.
- Scientific research is characterized by periodicity, which means that solving a research problem may constitute the beginning of the emergence of new research problems, and other researchers may follow the same procedures in addressing new research and thus verify its validity, and they may also use the research results to formulate a new research problem.
- Scientific research relies on facts, not on imagination and guesswork.
- It relies on analysis and the derivation of relationships, since the human mind has a limited ability to understand and comprehend complex phenomena unless it depends on analysis to simplify those phenomena and understand the factors and relationships governing them.
- It relies on accurate measuring tools, with the aim of reaching precise results.
- The focus in scientific research is on adopting scientific methods based on objectivity and neutrality in identifying, analyzing, and addressing problems, finding appropriate, convincing, and legitimate scientific evidence and presenting it with honesty and integrity, as well as mental and scientific openness and a

sincere willingness to accept other opinions. Added to the above is also determining the purpose and goal of the research and combining theory and practice in addressing the raised research problem.

Second: Training Programs

In order to know and understand the general meaning of training programs, it is necessary to understand the meaning of training, which we will address in the following steps:

1. Training:
   Edwin Flippo defines it as: "... the process of increasing the knowledge and skills of an employee to perform a specific job."

Michel Armstrong defines it as: "... the systematic development of the knowledge, skills, and attitudes required by an individual to perform a specific task or job appropriately."

It can also be defined as: "A planned process of modifying behavior, knowledge, or skill through learning experiences to achieve effective performance in an activity or a set of activities. Its purpose, in the case of work, is to develop the individual's capabilities and meet the current and future needs of the organization."

Thus, training can be described as an organized process that enables employees and workers to learn and acquire new knowledge, skills, and behaviors that qualify them to deliver distinguished job performance characterized by quality and high efficiency, thereby contributing to enabling the institution to improve its performance and ability to respond to current and future development challenges.

2. Guide to Managing Training Programs:

There are a set of methodological rules that must be followed during the preparation and management of any training program, which usually include four methodological rules defined as follows:

2-1. Identifying Training Needs:

This is a basic step in preparing and managing training programs, because of its significant impact on the efficiency of training programs and the effectiveness of training policies in improving the performance of the individual and the institution. For this reason, it is classified as the first and most important stage in developing the workforce.

2-2. Planning and Designing Training Programs:

This is the process that connects the training needs and the objectives that must be achieved through the training program, and links the methods, resources, and training topics together in an organized manner.

2-3. **Implementing Training Programs:**

This is the process in which the outputs of the training needs assessment and the planning and design process are translated from the theoretical level to the practical level.

2-4. Evaluating Training Programs:

According to Goldstein, training evaluation is the systematic collection of data and information related to the success of training programs.
The model of Donald L. Kirkpatrick is one of the most important models adopted in evaluating training programs, as this model focuses on four levels: the level of reaction, the level of learning, the level of behavior, and the level of overall results achieved by the organization.

Third: Human Resources in the Municipality

1. The Municipality:

It is one of the most important administrative bodies reflected by the local administration system. It thus represents one of the forms of administrative organization in the state, undertaking a set of powers and duties, which makes it responsible for efficiently managing its facilities, and obligated to strive to achieve its legitimate purposes.

Therefore, it can be concluded from the above that the municipality is one of the outputs of the administrative reform policies in the state, aimed at reducing the burdens and responsibilities of central bodies, in order to bring the administration closer to the citizen. This contributes to speeding up the response to citizens' needs. Thus, the municipality has become responsible for improving and developing public service and the process of local development.

2. Human Resources Active in the Municipality:

In order for the municipality to perform its assigned tasks, it must have qualified human resources to perform a set of functions that have become within the jurisdiction of the municipality. The municipality often has diverse human resources, due to several reasons, the most important of which is that the municipality is an administrative body for activating the local administration system.

Among the elements of local administration is the possession of legal personality, which is the legal basis that distinguishes it from administrative centralization. This truth was confirmed by the French jurist Georges Vedel, who said: "Legal personality is the natural result of the establishment of decentralization and for the protection of its legal interests."

However, possessing legal personality is not sufficient to embody the idea of local administration; there must be elected local bodies that supervise the management of public affairs of local populations on their behalf. This idea comes from the premise that since it is impossible for all residents of regions or countries to directly manage their public affairs themselves, it is necessary that those elected on their behalf carry out that task. Thus, elections are the basic method by which local councils representing the will of the regional public legal personality are formed. This is considered by many researchers to be the essence of local administration.

From this, it can be concluded that the elected members constitute one of the most important human resources active in the municipality and often take on the task of managing local affairs.

In light of the accelerating and endless diversity of local community needs, this has led to the development of the functions undertaken by the municipality in many administrative, economic, social, and cultural fields. These functions require planning and implementation by qualified public employees, including administrators, engineers, and technicians. This category is referred to as local employees.

John Stuart Mill provided a definition describing local employees as follows: "They constitute the permanent force of governmental interests. Those who do not change with political changes but remain in their positions to assist the elected body with their experience and traditions, placing at its disposal their knowledge of technical performance methods, and carrying out the details of work under its general supervision..."

In addition to the above, the municipality includes other categories within its human resources. Among these categories are the professional workers, who constitute the group responsible for technical tasks such as maintenance, as well as tasks related to hygiene, public cleanliness, and urban planning. Alongside this, the municipality may resort to contracting experts and consultants in order to benefit from their expertise in the process of local development. This group forms a vital element within the municipality's human resources, due to the knowledge, skills, and behaviors they possess which are consistent with contemporary developments.

Axis Two:
Mechanisms for Strengthening Communication and Interaction Between Scientific Research and the Management of Training Programs

What is meant by strengthening communication is providing the appropriate environment that enhances continuous communication and interaction between the actors operating at the level of universities, institutes, research centers, and laboratories—professors, researchers, and students—and the actors operating at the level of the municipality and its affiliated institutions—elected members and local employees. This is for the purpose of studying and analyzing development issues concerning the municipality, including the issue of developing the capacities of its human resources through the preparation and management of training programs according to objective standards that are consistent with the nature of contemporary developments.

Therefore, we will attempt to present a proposed scientific conception for strengthening communication between scientific research and the management of training programs as follows:

First: Activating the Idea of Community Participation in the Municipality

The current and future development challenges cannot be faced or responded to by the municipality in isolation from the active parties within the local community, particularly the scientific elites active in the field of scientific research. Hence, it has become necessary to activate the idea of community participation as an approach to respond to developmental challenges and to manage local affairs in a manner that meets the needs of the local community.

Community participation is considered one of the pillars of the new concept of the state, which adopts what is called "governance" or "societal governance." This refers to the political, economic, and social practice of state authorities, aimed at managing state affairs across all fields and levels. It reflects the mechanisms and procedures of the various institutions of the state, with the aim of enabling citizens to express their opinions, practice their rights, and fulfill their obligations.

Thus, activating the idea of participation—considered one of the components of governance or societal governance—requires providing opportunities to all qualified individuals and groups of the local community, in accordance with the law, enabling them to express their opinions and participate in preparing, implementing, monitoring, and supervising local plans and projects, either directly or indirectly. This is in order to achieve political, economic, and social development, thereby improving the quality of life for local residents and meeting their needs fairly, without harming national interests through regional disparity conflicts.

The local actors active in the field of scientific research are among the most important actors whose capacities should be relied upon in managing local affairs. This is because they are closely connected to the developments occurring in administrative, technological, economic, social, and cultural fields globally, especially in advanced countries pioneering in local governance. Moreover, these actors focus on handling issues in their field of specialization with objectivity and avoiding subjectivity, which results in accurate recommendations and findings that can be implemented in reality.

Since the beginning of the 21st century, the development process has been measured by the level of investment in minds, as confirmed by the thinker *Mehdi El-Mandjra* through his vision that "the real capital that is not subject to decay is the type of minds being shaped, and the quality of people who are genuinely trained."

Therefore, it is very important to provide opportunities for actors in the field of scientific research to participate in the management of municipal affairs, including the aspect related to the management of training programs for its human resources, which is the cornerstone for preparing competent individuals capable of delivering outstanding performance.

Speaking of the importance of scientific research in managing municipal affairs, Professor *Adel Khudair Al-Kubaisi* explained, through his intervention entitled *"Aspects of Shortcomings and Deficiencies in Theses and Dissertations Regarding Development Problems and Challenges: Causes and Remedies"* during the scientific forum at the College of Graduate Studies at Naif University for Security Sciences in Riyadh, that "scientific research contributes to identifying the needs of comprehensive and sustainable development, addressing its problems, anticipating its challenges, providing its requirements, weighing its options, introducing its theories, distributing its expertise, and sustaining its resources. Since man is both the goal and means of development, research and studies must give him priority and subject him to study and analysis in all his forms, conditions, and activities."

The emphasis on the importance of involving local actors in the field of scientific research did not come out of nowhere. Rather, it stems from the growing global attention to several issues closely linked to development, chief among them the role of universities and scientific research centers in managing the process of local development. These have become the tools through which this process is rationalized, given that universities and research centers serve as consultative centers, think tanks, and knowledge banks. They conduct scientific studies aimed at monitoring reality and defining future features for all.

Moreover, scientific research is no longer an academic luxury practiced by a group of researchers isolated in ivory towers. Rather, its essence is now measured by the effective role it plays in the development of contemporary human societies, regardless of their rank on the ladder of civilizational progress. No two disagree on the importance of scientific research in opening the way for creativity and excellence among individuals and peoples of these societies, and in equipping them with the ability to acquire the foundations of growth on sound principles.

On another note, allowing local actors to participate in managing local affairs requires re-engineering the level of competence of municipal human resources, especially elected members in the form of presidents of municipal popular assemblies, since they represent the authority supervising administrative leadership within the municipality. This is intended to enable them to know, understand, and activate the idea of involving actors in scientific research as an approach to studying and addressing issues related to local development. This requires organizing periodic training programs for local administrative leaders, including themes on the idea of community participation and its importance in rationalizing the management of local development. It also requires encouraging professors, researchers, and university graduates, especially youth, to run for local elections, as they are the group knowledgeable about modern approaches in managing local development, including the approach of community participation.

As for local actors, they must bear their responsibility, which lies in striving to present initiatives that would enhance the municipality's performance. This requires preparing theoretical and applied scientific research consistent with contemporary developments and applicable to the local environment.

Second: Electronic Platforms and Their Role in Enhancing Means of Communication and Continuous Cooperation Between Actors in Scientific Research and Those Managing Municipal Affairs

Activating the community participation approach at the municipal level is a necessary orientation to provide real opportunities for local actors in the field of scientific research to enrich the management of local affairs, including the aspect related to managing training programs, with the scientific knowledge, skills, and expertise they possess. However, it is also necessary to support this approach with other approaches of a technological nature, as they provide the appropriate foundation for strengthening communication and continuous interaction between the municipality and local actors.
Therefore, it is very important to establish electronic platforms to enhance the role of scientific research in developing the management of training programs. As an initial conception, the main elements that these platforms should contain can be presented as follows:

1. **At the level of participants in the digital platforms:**

The digital platform should serve as a space for continuous communication between the municipality's human resources—specifically elected members, public employees, and professional workers—and local actors active in the field of scientific research—specifically university professors, researchers, PhD students, and experts in capacity-building and development. It is very important to subscribe to the platform by opening a professional electronic account and attaching all personal, academic, and professional information of the participants.

2. **At the level of activities to be addressed through the digital platforms**:

The scientific conception of creating a digital platform to strengthen communication and interaction between the municipality and local actors in the field of scientific research generally aims to address development issues based on objective and precise standards, in order to reach the highest levels of quality and rationality in providing public services and managing local development.
There is no doubt that developing human resource capacities is a key factor in enhancing performance levels. However, developing capacities requires preparing and managing training programs according to precise and objective standards. Therefore, among the most important activities to be considered when addressing development issues through digital platforms are all aspects related to training programs: identifying training needs, planning and design, implementation, and evaluation. These four stages constitute the basic starting point for any capacity development process. The main elements to focus on can be outlined as follows:

2-1. Job description:

Relying on scientific methods in preparing job descriptions helps achieve accurate and clear results. A scientifically based job description makes it possible to determine the qualifications required for each position, thereby facilitating the measurement of training needs. This process should be carried out in coordination between the municipality and actors in scientific research. Undoubtedly, adopting digital platforms will enhance the proper management of this developmental task.

2-2. Adopting periodic field studies for training program management:

It is very important to rely on digital platforms in conducting periodic field studies every quarter, semester, or year, by preparing electronic questionnaires and distributing them through the platform to the target sample. This aims to collect the necessary information and data to achieve a number of objectives, most importantly evaluating the performance level of individuals, groups, and the municipality as a whole. At the same time, it is essential to emphasize the importance of these field studies in enabling the development of individual and institutional capacities, with the aim of attracting as many human resources as possible to participate in such important studies.
In addition, the results of the evaluation must be used as a starting point for future studies such as scientific articles, national and international conferences, academic training research projects, and doctoral projects. This helps achieve the following benefits:

2-2-1. At the level of identifying training needs:

- Identifying strengths and weaknesses in performance and the main problems that may hinder performance improvement and development at the level of municipal human resources, organizational structures, and departments managing municipal affairs, as well as at the level of the municipality as a whole.

- Determining whether improving and developing performance in the municipality requires nominating its human resources for training.
- Identifying the organizations and departments that need to nominate their human resources for training.

2-2-2. At the level of planning and implementing training programs:

- Identifying the groups in need of training programs (elected members, public employees, professional workers).
- Identifying the level of capacities to be developed among the trainees, generally consisting of three levels: knowledge, skills, and behaviors.
- Determining the type of training program (internal at the municipal level, external at the level of local, regional, or central training institutions, or external at the level of international training institutions).
- Defining the time frame of the training program—whether developing the capacities of municipal human resources requires a long-term or short-term program.
- Specifying the subjects and content of the training program, the training methods to be adopted during the program, the type of trainers supervising the training sessions, as well as the budget to be prepared for participation in the training program.
- Proposing leading institutions in the field of capacity-building and development that are distinguished by successful experiences in fields that have become part of the municipality's responsibilities, which helps achieve positive feedback at the level of performance.

2-2-3. At the level of evaluating the outputs of training programs:

Evaluating training programs is one of the most important stages that must be observed to determine the effectiveness and efficiency of the program in enabling trainees to develop their knowledge, skills, and behaviors, and the impact of this on their individual performance as well as the performance of their institution as a whole. Therefore, it is very important to take into account the results of field studies adopted through digital platforms in order to reach the following conclusions:

- Determining levels of reaction, learning, behavior, and overall results achieved at the level of organizations and departments whose human resources participated in training programs.
- Determining whether the training program should continue.
- Identifying needs related to improving and developing the training program.
- Ensuring learning.
- Rationalizing the impact of the training process.
- Determining a training program that is aligned with the organization's goals (aligning training with the objectives the municipality seeks to achieve).
- Identifying methods and mechanisms that make the training program contribute to improving and developing the knowledge, skills, and behaviors of the trainees.
- Comparing the cost and return of the training process.
- Identifying strengths and weaknesses in the training program.
- Assessing whether the trainees have benefited from the training process.
- Enabling the future marketing of training programs.
- Preparing a background for decision-making.
- Monitoring the quality of the training process.
- Determining whether the training program justifies the approved cost or budget.
- Acquiring the ability to make informed decisions, such as stopping ineffective training programs and expanding effective ones.
- Determining the effectiveness of the various components of the training program, such as program content, facilities, methods, equipment and supplies, trainers, and the training schedule.
- Identifying the number and type of employees likely to participate in future training programs.
- Gaining practical insight to design more effective future training programs.
- Determining the degree of alignment of the training program with training needs and its ability to cover them.
- Assessing the extent to which trainees apply the acquired knowledge, skills, or behaviors to their job performance.

Third: Activating the Artificial Intelligence System

Recent developments in deep learning have produced artificial intelligence systems capable of matching or even surpassing human intelligence in certain core functions. However, reaching the level of "general artificial intelligence," or the level that enables machines to perform the full range of cognitive tasks that the human mind can accomplish, still requires decades. Nonetheless, many machine learning systems have already been developed for specific commercial uses, with highly diverse applications. They are capable of providing customer service, managing logistics, monitoring factory equipment, rationalizing energy consumption, and analyzing medical records. The McKinsey Global Institute (MGI) confirmed in recent research that machine learning technologies are widely applicable across almost all industries.
Therefore, adopting an artificial intelligence system in the management of training programs would contribute to rationalizing this process. This requires adopting several measures to consolidate this orientation, foremost among them activating the role of scientific research as a basic entry point into this process, given that artificial intelligence is one of the recent outputs reflected by scientific research in the field of science and technology.
Accordingly, understanding and knowing the general meaning of artificial intelligence, the ability to control its different models, and the proper application of these in various fields, including the field of training program management, requires the presence of highly competent actors in scientific research. The availability of these actors will help achieve several advantages, the most important of which is the development of new artificial intelligence models in the areas of identifying training needs, planning and designing training programs, implementing training programs, and evaluating training programs.

Conclusion:

At the conclusion of this study, it can be said that scientific research has become one of the important approaches that should be adopted to rationalize the management of training programs for human resources in the municipality. This is based on the fact that scientific research contributes to aligning training programs with the current and future developments in administrative, economic, social, and cultural fields. Therefore, it is necessary to provide an appropriate environment that attracts active stakeholders in the field of scientific research to take the initiative in presenting modern studies, in order to contribute to the development and rationalization of local affairs management, particularly the management of training programs, which constitute the cornerstone for improving and developing the performance of municipalities.
We have reached a set of findings and recommendations, the most important of which can be summarized as follows:
Acknowledgements: no
Conflict of interest: no

1- Findings:

- The management of training programs for human resources in the municipality cannot be developed without the involvement of local actors active in the field of scientific research.
- Community participation is among the main approaches that help activate the role of scientific research in developing the municipality's capacities.
- Digital platforms are among the most important tools that help document and strengthen continuous communication and interaction between those managing municipal affairs and the actors active in scientific research, which contributes to achieving several outcomes related to developing training program management, most notably:
    - The ability to conduct periodic evaluation of municipal performance levels according to scientific standards.
    - Providing scientific mechanisms that help collect the necessary information and data to identify the training needs of municipal human resources.
    - The ability to plan, design, and implement training programs in a way that responds to the needs of the municipality and the local community.
    - The ability to evaluate the outputs of training programs according to scientific standards, which helps identify strengths and weaknesses, and consequently propose solutions that enhance the quality of training programs.
    - Artificial intelligence represents one of the most important outcomes of scientific research that should be adopted to rationalize the management of training programs.

2- Recommendations:

Among the most important recommendations that can contribute to the development of training program management, particularly at the level of Algeria in particular and the Arab countries in general, are the following:

- It is very important that those responsible for managing municipal affairs, especially administrative leaders, possess extensive knowledge and awareness of the importance of involving local actors, foremost among them the scientific elite, in addressing the present and future issues of local administration, including the issue of developing and rationalizing the management of training programs for local human resources.
- It is highly important to provide the necessary incentives for the scientific elite, especially young people, to run for membership in elected local councils, given that the scientific elite often rely on research in addressing development issues.
- Modern mechanisms should be adopted to document and strengthen continuous communication and interaction between municipal managers and actors active in the field of scientific research, primarily through the establishment of smart digital platforms.
- Serious and extensive attention should be given to the field of artificial intelligence in scientific research, with the aim of acquiring the ability to activate it in rationalizing training program management.
- It is very important to conclude international cooperation agreements with leading institutions in the field of scientific research, in order to enable local actors active in this field to understand and become familiar with the latest scientific research developments, particularly modern artificial intelligence models, thereby acquiring expertise that qualifies them to contribute to the preparation of training programs that respond to contemporary developments.
- Material and moral support should be provided to local actors active in scientific research to encourage them to produce scientific efforts that enhance the efficiency and quality of training programs.

Abstract

The rapid expansion of digital communication platforms has transformed social interaction among university students, creating both opportunities for engagement and risks associated with maladaptive behaviors such as cyberbullying. This study investigates the prevalence of cyberbullying and its impact on self-esteem among university students at Abdelhamid Ben Badis University, Mostaganem. Employing a descriptive-analytical approach, the study utilized two standardized instruments: the Cyberbullying Scale (Hussein, 2019) and the Self-Esteem Scale (Bin Al-Sayeh, 2023). The sample consisted of 150 male and female students from the Faculty of Humanities and Social Sciences. Psychometric analyses confirmed the reliability and validity of both scales, with Cronbach's alpha coefficients of 0.749 for the Cyberbullying Scale and 0.806 for the Self-Esteem Scale, and Guttman split-half coefficients of 0.85 and 0.79, respectively.

The results indicate a high prevalence of cyberbullying among university students, with the mean score significantly exceeding the hypothetical average ($M = 97.40$, $SD = 19.61$, $t(149) = 18.36$, $p < 0.01$). Students also exhibited high levels of self-esteem ($M = 64.67$, $SD = 10.20$, $t(149) = 12.81$, $p < 0.01$). Regression analysis revealed a statistically significant negative relationship between cyberbullying and self-esteem ($\beta = -0.614$, $p < 0.001$, $R^2 = 0.102$), indicating that increased cyberbullying predicts lower self-esteem among university students. These findings highlight that cyberbullying not only persists in higher education settings but also poses a significant threat to students' psychological well-being, particularly in the context of self-perception, social confidence, and academic motivation.

The study underscores the importance of developing preventive strategies, including institutional regulations on digital behavior, awareness campaigns, and psychological support programs aimed at enhancing self-esteem and mitigating the harmful effects of cyberbullying. Moreover, it contributes to the growing body of research on cyberpsychology and provides empirical evidence to inform policy-making in educational institutions.

Introduction

In recent decades, the world has witnessed an unprecedented technological and communications revolution that has profoundly transformed human lifestyles and reshaped the ways in which individuals and societies interact. The rapid development of information and communication technologies has made the internet and smartphones indispensable tools for knowledge transfer, social networking, and cultural exchange. Within this context, social media platforms have emerged as one of the most prominent outcomes of this digital revolution. These platforms have not only helped bridge geographical and cultural divides but have also posed significant challenges, such as the erosion of cultural identity, the rapid spread of misinformation, and concerns over social values and digital security. Furthermore, the ways individuals engage with these technologies vary considerably—from balanced and constructive use to excessive or harmful misuse—which has significant repercussions for social life (Intesar Muhammad, 2020).

Amidst this massive and accelerating digital transformation, social media platforms such as Facebook, Twitter, Instagram, and others have become double-edged tools. On the one hand, they facilitate social interaction, knowledge dissemination, and cultural dialogue; on the other hand, they have fostered new and troubling forms of deviant behavior. Among the most concerning is **cyberbullying**, defined as the deliberate and repeated use of digital technology to inflict psychological, social, or even economic harm on others. Manifestations of cyberbullying include rumor spreading, threats, intimidation, harassment, and various forms of exploitation—whether sexual, material, or intellectual. Previous studies confirm that while the internet and mobile technologies offer novel opportunities for communication, they also create fertile ground for such harmful interactions (Tokunaga, 2010; Palermiti et al., 2017).

Cyberbullying can be understood as an extension of traditional bullying behaviors, but with an alarming shift: the use of digital technologies amplifies and accelerates the scope of harm. This phenomenon has become increasingly widespread due to the proliferation of smartphones, which integrate internet connectivity and instant multimedia sharing. These features make it easier for offensive content to be disseminated quickly and widely, thereby intensifying the destructive effects of cyberbullying. Research has shown that cyberbullying can lead to severe psychological consequences, including depression, anxiety, and social isolation, and in some cases, it may even be linked to extremist behavior (Al-Ammar, 2016; Bastug & Kircaburun, 2016; Lehto & Uusitalo, 2016).

The digital environment further complicates this issue by enabling anonymity, which emboldens perpetrators to engage in aggressive behavior without immediate accountability. Moreover, harmful digital content can spread rapidly and persist indefinitely, exacerbating victims' distress. Juvonen and Gross (2008) and Della Cioppa et al. (2015) highlight that this dynamic increases the reach and permanence of cyberbullying, magnifying its psychological and social impact. Indeed, victims of cyberbullying are at heightened risk of developing depression, anxiety disorders, and even substance abuse (Takizawa et al., 2014; Palermiti et al., 2017). Ybarra (2004) also found that such victims often experience aggression, social withdrawal, loneliness, and diminished self-esteem, particularly when they engage in deceptive online self-presentation.

Bullying in all its forms represents a serious behavioral and social problem with profound implications for individuals' well-being. Among university students, the consequences of cyberbullying are especially concerning. Victims often experience fear, withdrawal, social isolation, and declining academic performance. Moreover, research has consistently identified low self-esteem as both a predictor and a consequence of exposure to cyberbullying (Egan & Perry, 1998). Conversely, high self-esteem is associated with resilience, better coping strategies, and stronger academic adjustment.

Given the central role of self-esteem in shaping personality development, social relationships, and academic success, investigating its relationship with cyberbullying is crucial. University students represent one of the groups most vulnerable to this phenomenon due to their heavy reliance on digital technologies and their constant presence in online environments. Consequently, exploring the impact of cyberbullying on students' self-esteem provides valuable insights into both the psychological costs of the digital age and the need for preventive and intervention strategies within higher education contexts.

Literature Review and Theoretical Framework

Self-Esteem: Definitions and Perspectives

Al-Baqour (2002) defined self-esteem as *"the judgments that an individual makes about himself compared to others, reflecting his perceived abilities and skills to perform a specific task or achieve success"* (Alkhasawneh & Others, 2022, p. 1931). Similarly, Brenden (1995) conceptualized self-esteem as a fundamental human need that profoundly influences multiple aspects of human existence, including conscious living, self-acceptance, personal responsibility, self-assertion, meaningful living, and the preservation of personal integrity (Adawi & El-Sherbini, 2021, p. 385).

Considering self-esteem as a central factor shaping human behavior, Hayawi and Ben Salem (2022) argue that an individual's self-perceptions and self-judgments directly determine their positive or negative motivations to engage in adaptive or maladaptive social behaviors (p. 661). Kafawin (2003) further explained that low self-esteem often results from an individual's need for external validation. Conversely, when individuals are aware of their strengths and weaknesses, they can set meaningful goals and foster motivation. Self-confidence and the expectation of success thus play crucial roles in strengthening self-esteem (Kafawin, 2017, p. 45).

Rosenberg (1979), one of the leading scholars on the subject, defined self-esteem as the evaluation an individual typically makes of themselves, involving an orientation toward approval or disapproval. High self-esteem reflects feelings of competence, self-worth, and self-respect, while low self-esteem is associated with self-rejection and diminished confidence (Ali, 2021, p. 149).

From an educational perspective, self-esteem is considered a key psychological variable, particularly at the university level. It is among the most influential determinants of the student learning experience and academic achievement. Researchers agree that the acquisition of various skills is more effective when coupled with positive self-esteem, which plays a central role in guiding students' behavior and achievement (Qadi, 2019, p. 19).

Self-Esteem and Demographic Variables

Numerous studies have examined self-esteem across demographic factors. For example, Qadi (2019) and Miri (2023) reported no significant differences in self-esteem based on gender. In contrast, Bin Al-Sayeh (2023) found higher self-esteem levels among males. Furthermore, Kafawin (2017) and Ali (2021) demonstrated that self-esteem differs significantly by academic specialization, suggesting that disciplinary contexts may influence self-perceptions.

Cyberbullying and Self-Esteem

Recent research has highlighted a negative association between cyberbullying and self-esteem. Victims of cyberbullying often report diminished self-esteem (Chang et al., 2013; Cénat et al., 2014). Although the causal direction remains contested, some scholars argue that persistent online harassment may lead to decreased self-esteem, which, in turn, can have profound consequences for young people's well-being, including heightened vulnerability to depression, psychological maladjustment, and even suicidal ideation (Palermiti et al., 2017).

For instance, Mohamed et al. (2023) reported that 24.8% of adolescent students experienced social isolation, 29.4% were victims of cyberbullying, 37.3% reported low self-esteem, and 17.1% expressed suicidal thoughts. Their findings confirmed an inverse relationship between cyberbullying exposure and self-esteem. Similarly, Patchin and Hinduja (2010), Hussein and Mahmoud (2021), and Al-Nuaimi et al. (2023) found that both bullies and victims exhibited lower levels of self-esteem, highlighting the bidirectional impact of cyberbullying. By contrast, Ahmed (2023) reported no statistically significant correlation between the two variables, suggesting that contextual or cultural differences may play a role.

Purpose of the Study

Given the widespread use of digital technologies among university students, this study aims to investigate the impact of cyberbullying on students' self-esteem, as this group is particularly vulnerable to the negative consequences of online aggression. The study seeks to answer the following research questions:

1. What is the level of cyberbullying among university students?
2. What is the level of self-esteem among university students?
3. Does cyberbullying affect self-esteem among university students?

Hypotheses

- The level of cyberbullying among university students is high.
- The level of self-esteem among university students is high.
- Cyberbullying has a significant impact on the self-esteem of university students.

Objectives of the Study

- To determine the prevalence of cyberbullying among university students.
- To assess the level of self-esteem among university students.
- To examine the impact of cyberbullying on students' self-esteem.

Significance of the Study

The importance of this study stems from both the relevance of its topic and the significance of its target population. Cyberbullying is a contemporary and pressing issue that threatens the mental health of students. In the Arab and Algerian context, research on cyberbullying remains relatively new, particularly in relation to its effects on university students. By exploring this issue, the study provides insights into how digital misuse affects self-esteem, academic achievement, and overall psychological well-being. The findings are expected to contribute to preventive and therapeutic intervention programs, as well as to the development of strategies aimed at reducing the prevalence of cyberbullying and mitigating its harmful effects.

Theoretical Framework

Cyberbullying

Patchin and Hinduja (2010) define cyberbullying as behaviors involving harassment, intimidation, or threats delivered through digital means, such as sending or posting humiliating or threatening texts, images, or videos online without consent. Similarly, Smith et al. (2008) describe cyberbullying as *"an intentional act of aggression by a group or individual, using electronic forms of communication, repeatedly and persistently against a victim who cannot easily defend themselves"* (p. 376).

Definition of Cyberbullying

According to Denmark (2014), cyberbullying is defined as the deliberate and hostile use of communication technologies to inflict harm on another person. It is regarded as a unique phenomenon of the twenty-first century, characterized by the use of cyberspace to transmit aggressive messages or content directed toward others. Billy Belsey, who first coined the term *cyberbullying*, defined it as the use of information and communication technologies to engage in intentional, repeated, and hostile behaviors—either by an individual or a group—aimed at harming others (Ramadan, 2019, cited in Yoob, 2023, p. 34).

Methods of Cyberbullying

Cyberbullying is perpetrated through a wide range of digital channels, as aggressors exploit modern communication platforms to inflict harm. These methods include the use of social media, text messages, emails, phone calls, fake web links, and chat or messaging applications. Smith et al. (2008) emphasized that these platforms allow bullies to expand the scope of psychological and social harm, facilitated by their rapid reach and the possibility of anonymity. Hinduja and Patchin (2009) further argue that the repetitive and deliberate nature of cyberbullying intensifies its effects, rendering it more severe than traditional forms of bullying, particularly because the victim often finds it difficult to defend themselves in digital environments.

Forms of Cyberbullying

Cyberbullying manifests in diverse forms, varying according to the methods used and the intent of the aggressor. Direct forms may include technical harm (e.g., sending viruses or changing passwords), verbal abuse (e.g., threats and insults), nonverbal abuse (e.g., posting disturbing images), or social exclusion (e.g., removing the victim from virtual groups). Indirect forms include more concealed practices such as hacking devices, stealing personal information, impersonation using false identities, and spreading defamatory content designed to damage reputations (Yoob, 2023).

Building on these distinctions, Beran and Li (2007), Willard (2007), and Ben Arabiya (2023) classified cyberbullying into several key categories:

- **Cyber Anger:** The transmission of hostile or offensive messages to a victim, either within group settings or through private digital communication.
- **Cyber Harassment:** Persistent and repeated sending of abusive or intimidating messages via email or messaging platforms.
- **Cyber Dialogue:** A severe form of harassment that includes explicit threats of harm, excessive verbal abuse, or defamatory online discussions.
- **Cyber Denigration:** The dissemination of harmful, false, or derogatory content about a victim to others, often in the form of posts or public statements.
- **Impersonation:** Assuming the victim's identity in order to publish damaging content or to mislead others into perceiving the victim negatively.
- **Exposure and Privacy Violation:** Unauthorized sharing of personal messages, private images, or sensitive information, whether digitally or physically.
- **Exclusion:** Intentional ostracism of the victim from online communities or platforms, often coupled with efforts to encourage others to exclude the individual, thereby amplifying their psychological distress.

Statistics on Cyberbullying

Statistical evidence underscores the growing prevalence of cyberbullying globally. Patchin (2016), reporting on findings from the Cyberbullying Research Center, revealed that:

- 18% of children and adolescents worldwide had experienced cyberbullying.
- 70% of internet users globally reported having encountered online abuse at least once.
- Only 15% of students admitted to being victims of cyberbullying.

- Approximately 10% of victims never reported their experiences to an adult.
- 64% of cyberbullying victims stated that it negatively impacted their academic performance and fostered fear and insecurity.
- 79% of parents reported that their children had received physical threats while engaged in online gaming (Yoob, 2023, p. 34).

More recent data (2018–2022) reflect an upward trend in cyberbullying. Among boys, the proportion engaging in cyberbullying increased from 11% to 14%, while among girls, it rose from 7% to 9%. Reports of victimization also grew, from 12% to 15% among boys and from 13% to 16% among girls. This escalation coincides with the increasing amount of time adolescents spend online. As the World Health Organization (2024) stresses, these findings highlight the urgent necessity for multi-stakeholder interventions involving educators, parents, policymakers, and community leaders to promote digital literacy, enhance online safety, and mitigate the harmful effects of cyberbullying.

Self-Esteem

Al-Anzi (2019) defines self-esteem as an individual's general evaluative orientation, characterized by relative stability and encompassing the person's judgment of themselves—whether positive or negative—based on both internal and external determinants. In a similar vein, Baccini and Ramdhani (2017) describe it as an affective process through which the individual evaluates the self-image shaped by beliefs, values, emotions, thoughts, and attitudes. This process includes acceptance or rejection of oneself, the perception of worthiness and merit, and the sense of competence in social interactions.

Hewitt (2009) and Smith and Mackie (2007) emphasize that self-esteem represents the overall emotional evaluation that an individual attributes to the self. It reflects cognitive assessments as well as affective experiences, such as feelings of pride or shame. In this regard, self-esteem may be viewed as the positive or negative judgments directed toward the self (Adawi & El-Sherbini, 2021). Cooper Smith adds that self-esteem consists of a set of attitudes and beliefs recalled by an individual when confronting the world, encompassing beliefs about the likelihood of success, the potential for failure, and the amount of effort required (Abo-Ghali, 2012).

Scholars have addressed self-esteem from multiple perspectives. One approach considers it as an evaluation, whereby individuals and others form judgments about the meanings attached to the self. These meanings manifest across dimensions such as physical self, identity, self-concept, and self-perception, and are reflected in communicative behaviors (Shaqfeh, 2009). Another perspective views self-esteem as a need. Maslow distinguishes between the need for self-appreciation—associated with achievement, efficiency, self-confidence, and reliability—and the need for prestige, recognition, and admiration from others (Ahmed, 2010).

Self-esteem has also been conceptualized as a condition. Kristen and colleagues (1999) describe it as an overall self-perception involving evaluative judgments of both positive and negative dimensions, with positive self-appreciation linked to psychological well-being and negative judgment associated with depressive tendencies (Ibn Al-Sayeh, 2023). From yet another perspective, self-esteem is seen as a tendency, reflecting positive feelings toward the self, such as competence, self-admiration, strength, and the perception of being worthy of love (Douara, 2023). It may also be understood as an expectation shaped by social feedback. Adler highlights the connection between inferiority feelings and low self-esteem, while Allport underscores the relationship between perseverance, strength, and self-esteem. Existential approaches, such as those of Rollo May, further associate it with the fundamental question of existence itself ("to be or not to be") (Richard & Scolt, 1989).

Several theoretical models have provided deeper insight into the dynamics of self-esteem. Carl Rogers' self-theory (1959), as explained by Al-Zyoud (2008), situates the self at the center of personality, distinguishing between the actual self and the ideal self. Psychological adjustment occurs when harmony exists between these two aspects, whereas incongruence results in maladjustment and emotional difficulties (Al-Saeedi, 2021). Rosenberg (1965), as noted by Al-Ma'aytah (2008), considers self-esteem as a general orientation toward the

self, influenced by socialization processes, family, schooling, and peer relationships. His view emphasizes the comprehensive nature of self-esteem as a global evaluation rather than a situational or fragmented judgment.

Ziller's theoretical perspective (1973) underscores the role of social interaction and comparison in shaping self-esteem. He argues that self-esteem acts as a mediator between the individual and the social environment, exerting either positive or negative effects on adjustment. Moreover, self-esteem is seen as developing within the framework of social reality, where changes in one's environment directly affect self-evaluation (Jaballah, 2002; Miri, 2023). Coopersmith's contributions (1976), discussed by Al-Hamshari (2013), distinguish between genuine self-esteem, reflecting authentic self-worth, and defensive self-esteem, which masks an underlying lack of self-worth. He identifies achievements, values, aspirations, and defenses as key determinants of self-esteem, and highlights the importance of parental practices such as empowerment, encouragement of positive behavior, and respect for autonomy in fostering healthy self-esteem (Al-Nuaimi & Abu Eish, 2023).

Previous research further illustrates the link between self-esteem and cyberbullying. Patchin and Hinduja (2010), in a study of 1,963 American students, found a negative correlation between cyberbullying and self-esteem. Both perpetrators and victims reported lower self-esteem compared to students not involved in bullying (Dahmani, 2023). Al-Kafawin (2017) examined the level of self-esteem among students at Tafila Technical University and found generally high levels, with notable differences in favor of female students, students in scientific disciplines, and those from rural areas. The study recommended further exploration of self-esteem in relation to other variables across educational contexts. Elizabeth (2018), in research on female students' use of social media, revealed that victims of cyberbullying often exhibited isolation, loss of confidence, and withdrawal from online interactions. The study highlighted both verbal and physical dimensions of bullying and underscored the mitigating role of family and school interventions in reducing its prevalence (Ada, 2023).

Basyouni and Al-Harbi (2020) conducted a study examining the relationship between cyberbullying and psychological loneliness among female students of the College of Education at Umm Al-Qura University. The study aimed to assess the prevalence of cyberbullying among female university students and its association with feelings of psychological loneliness. The sample comprised 133 female students representing various academic majors within the college. The findings revealed a statistically significant correlation between psychological loneliness and engagement in cyberbullying behaviors at the 0.05 significance level. Additionally, the mean scores on the cyberbullying scale ranged from medium to high, indicating that the scale effectively captured the reality of cyberbullying behaviors among female students. The psychological loneliness scale also yielded medium-level means, suggesting that participants experienced moderate psychological loneliness.

Hussein, Younis, and Mahmoud (2021) investigated the relationship between school bullying and self-esteem among pupils in the first cycle of basic education. The study included a sample of 210 male and female students, aged 9–12 years, from Al-Farouq Omar Institute. Data were collected using two scales measuring bullying behaviors and self-esteem. Statistical analysis demonstrated a significant negative correlation at the 0.01 level between bullying behavior and self-esteem. Gender differences were observed, with males exhibiting higher scores in total bullying, physical bullying, and property violations, whereas no significant gender differences were found in social, verbal, or psychological bullying. Female students displayed higher self-esteem levels than their male counterparts. Moreover, self-esteem scores were significant predictors of bullying behavior.

Ahmed Dahmani Abdelkader (2023) explored the relationship between cyberbullying and self-esteem among graduate students at the École Normale Supérieure in Bouzaréah, Algeria. The study sampled 52 graduate students from the English and History & Geography departments, representing both middle and secondary education specializations. Employing a descriptive methodology with cyberbullying and self-esteem scales, the results indicated no statistically significant correlation between cyberbullying and self-esteem. There were no gender differences in cyberbullying levels; however, significant differences emerged based on specialization profiles.

Douara Ahmed (2023) examined the relationship between self-esteem and learning motivation among Social Sciences students at the University of Tiaret, Algeria. The sample included 240 students from the first and third

academic years of the Social Sciences Department during the 2020–2021 academic year. Using both a self-esteem scale and a learning motivation scale, the study found that students exhibited above-average self-esteem. A positive correlation was observed between self-esteem and learning motivation. Additionally, female students displayed higher self-esteem than males, and first-year students showed higher self-esteem than third-year students. The study recommended further research to investigate the nature of the relationship between self-esteem and learning motivation.

Al-Nuaimi, Safiya Ahmed, and Abu Eish, Basina Rachad (2023) conducted research on cyberbullying and self-esteem among female students of the College of Arts at Taif University. Utilizing a descriptive correlational design, the study sampled 200 female students randomly selected from the college. Data were collected using a cyberbullying scale and the self-esteem scale developed by Al-Nuaimat (2015). The findings demonstrated a significant negative correlation between cyberbullying and self-esteem, with students exhibiting high self-esteem overall. Cyber-attacks were the most common form of bullying, followed by cyber-harassment, cyber-exclusion, and cyber-stalking. No significant differences were found in cyberbullying levels according to academic specialization.

Al-Shammari (2023) investigated university students' awareness of the concept of cyberbullying. Using a descriptive approach, the study employed a questionnaire administered to a random sample of 200 undergraduate students at the University of Hail. Results indicated a high level of awareness regarding cyberbullying. Significant differences were observed based on college specialization, favoring students in scientific disciplines, while no significant differences were attributed to age.

Ben Al-Sayah (2024) examined self-esteem among students at Laghouat University and its variation according to gender. The study applied a self-esteem scale to a randomly selected sample of 540 students. Findings revealed generally high self-esteem among participants, with male students displaying higher levels than females.

Al-Kabir (2024) studied self-esteem among students of the Faculty of Education at Sabha University – N'Djamena, considering demographic variables such as gender, academic specialization, parental education, family income, and urban background. Using a descriptive correlational method, the study sampled 342 students and employed a 50-item self-esteem questionnaire. Results indicated low overall self-esteem among participants, with higher levels observed in females. No statistically significant differences were found in self-esteem related to specialization, parental education, income, or urban/rural background.

Commentary on Previous Studies. Previous research has examined cyberbullying in relation to various psychological and social variables, including loneliness and awareness (Basyouni & Al-Harbi, 2020; Al-Shammari, 2023), as well as its manifestations among university students (Elizabeth, 2018). Most of these studies employed descriptive methodologies, confirming that cyberbullying is prevalent at moderate to high levels and has negative psychological and social consequences. Sample sizes across these studies varied, reflecting differences in research scope and population.

Regarding self-esteem, several studies investigated its level among students, highlighting differences based on gender or academic specialization (Al-Kafawin, 2017; Bin Al-Saaih, 2024; Al-Kabir, 2024; Douara, 2023). These studies generally reported high levels of self-esteem, with differences favoring female students or certain academic majors. Sample sizes in these studies ranged from medium to large.

Research exploring the relationship between cyberbullying and self-esteem (Patchin & Hinduja, 2010; Al-Nuaimi & Abu Eish, 2023; Hussein et al., 2021) typically employed correlational designs and mostly confirmed a negative relationship, indicating that increased engagement in cyberbullying is associated with lower self-esteem. However, Dahmani's (2023) study found no significant correlation, which may be attributable to the relatively small sample size compared to other larger and more diverse studies.

Practical Aspects of the Current Study

Study Context and Limitations. The study was conducted at Abdelhamid Ben Badis University, Mostaganem, within the Faculty of Humanities and Social Sciences, during the 2024/2025 academic year. The study's findings are therefore limited to this specific population and context.

Methodological Procedures. The research adopted a descriptive-analytical approach, which was considered the most appropriate for addressing the study objectives. The researchers utilized relevant instruments to collect, analyze, and interpret the necessary data effectively.

Study Instruments. Two primary scales were used to address the research questions: the Cyberbullying Scale and the Self-Esteem Scale.

The **Cyberbullying Scale**, developed by Ramadan Ashour Hussein (2019), consists of four dimensions with response options ranging from "Always" (3), "Sometimes" (2), to "Never" (1). The total scale score ranges from 34 to 102.

The **Self-Esteem Scale**, prepared by Ben Sayeh Masouda (2023), also comprises four dimensions. Responses are scored on a three-point scale: "Fully applicable" (3), "Sometimes applicable" (2), and "Never applicable" (1). Negative items are reverse-scored. Total scores range from 27 to 81.

Study Sample. The study sample included 150 male and female students from the Faculty of Social and Human Sciences at Abdelhamid Ben Badis University in Mostaganem. The distribution by gender is presented below:

Gender	Number	Percentage
Male	69	46%
Female	81	54%
Total	150	100%

The female category constituted the majority of the sample (54%), while males accounted for 46%.

Psychometric Properties of the Cyberbullying Scale

Construct Validity (Internal Consistency). The internal consistency between the scale dimensions and the total score was examined. Correlation coefficients are shown below:

Dimension	Correlation with Total Score
Cyber Harassment	0.860
Cyber Defamation	0.823
Cyber Impersonation	0.657
Cyberstalking	0.624

All correlation coefficients were positive and statistically significant at the 0.01 level, indicating that each dimension is consistent with the total score of the scale.

Discriminant Validity (Extreme Group Method). To assess the scale's discriminant validity, the extreme group comparison method was applied. Participants were divided into upper and lower groups to evaluate the scale's ability to differentiate between high and low levels of cyberbullying.

Variable	N (Lower)	Mean	SD	N (Upper)	Mean	SD	t-value	p-value
Cyberbullying	10	64.40	4.50	10	82.80	1.81	-11.989	0.000

The upper group's mean score (82.80) was significantly higher than the lower group's mean (64.40). The t-value of -11.989 and significance level of 0.000 ($p < 0.01$) indicate statistically significant differences between the groups, confirming the scale's discriminant validity and its ability to distinguish between varying levels of cyberbullying.

Scale Reliability and Psychometric Properties

Cyberbullying Scale Reliability. The reliability of the Cyberbullying Scale was assessed using two methods:

Cronbach's Alpha Coefficient. The internal consistency of the scale was evaluated using Cronbach's alpha. The results are presented in Table 4.

Table 4. Cronbach's Alpha Reliability Coefficient for the Cyberbullying Scale

Alpha Cronbach's	Number of Items	Dimensions
0.749	34	Cyberbullying

As shown in Table 4, the stability coefficient reached 0.749, indicating an acceptable level of reliability. Therefore, the Cyberbullying Scale is considered reliable for application in the study.

Split-Half Method. The split-half method was also employed to assess reliability by calculating the correlation between the first and second halves of the instrument. Because the variance between the two halves was not equal, the correlation was corrected using the Guttman split-half reliability coefficient. The results are summarized in Table 5.

Table 5. Reliability Coefficient Using the Split-Half Method

Correction Factor	Reliability Coefficient	Scale
Guttman Split	After Correction	Cyberbullying
0.81	0.85	

Table 5 indicates that the reliability coefficient was 0.81 before correction and increased to 0.85 after applying the Guttman correction, confirming high reliability suitable for research purposes.

Self-Esteem Scale Psychometric Properties

Construct Validity (Internal Consistency). The internal consistency of the Self-Esteem Scale was examined by calculating the correlation coefficients between each dimension and the total scale score, as shown in Table 6.

Table 6. Correlation Coefficients between Dimensions and Total Score of the Self-Esteem Scale

Consistency	Dimensions
0.695	Performance Goals
0.859	Psychological
0.780	Social
0.711	Physical Appearance

All correlation coefficients were positive and statistically significant at the 0.01 level, indicating that each dimension is consistent with the overall scale score.

Discriminant Validity (Extreme Group Method). To assess discriminant validity, the extreme group method was applied by comparing the scores of participants in the upper and lower extremes of the scale. The results are presented in Table 7.

Table 7. Differences Between Upper and Lower Group Means of the Self-Esteem Scale

Variable	N (Lower)	Mean	SD	N (Upper)	Mean	SD	t-value	p-value
Self-Esteem	10	50.80	4.31535	10	69.20	3.01109	-11.058	0.000

As shown in Table 7, the upper group had a mean score of 69.20 (SD = 3.01109), while the lower group had a mean of 50.80 (SD = 4.31535). The t-value of -11.058 with a significance level of 0.000 ($p < 0.01$) indicates statistically significant differences between the groups, confirming that the Self-Esteem Scale effectively discriminates between high and low levels of self-esteem.

Reliability of the Self-Esteem Scale

Cronbach's Alpha Coefficient. The internal consistency of the Self-Esteem Scale was further evaluated using Cronbach's alpha. The results are shown in Table 8.

Table 8. Cronbach's Alpha Reliability Coefficient for the Self-Esteem Scale

Alpha Cronbach's	Number of Items	Dimensions
0.806	27	Self-Esteem

As indicated in Table 8, the reliability coefficient reached 0.806, demonstrating that the Self-Esteem Scale possesses satisfactory stability and is suitable for application in the current study.

Split-Half Reliability of the Self-Esteem Scale

The reliability of the Self-Esteem Scale was further assessed using the split-half method. The instrument was divided into two halves, and the correlation between them was calculated. Due to unequal variance between the halves, the Guttman split-half reliability coefficient was applied for correction. The results are summarized in Table 9.

Table 9. Reliability Coefficient of the Self-Esteem Scale Using the Split-Half Method

Correction Factor	Reliability Coefficient	Scale
Guttman Split	After Correction	Self-Esteem
0.71	0.79	

As indicated in Table 9, the reliability coefficient reached 0.71 before correction and 0.79 after applying the Guttman correction, demonstrating adequate reliability for research purposes.

Presentation of Hypotheses

Hypothesis 1: The Level of Cyberbullying Among University Students is High

To test this hypothesis, the arithmetic mean, standard deviation, hypothetical mean, and a one-sample t-test were calculated. The results are presented in Table 10.

Table 10. One-Sample t-Test for Cyberbullying Scale Scores

Relative Weight	Significance Level	t-value	df	Hypothetical Mean	Deviation	Mean	Sample	Variable
95%	0.01	18.360	149	68	19.6161	97.40	150	Cyberbullying

The results indicate that the arithmetic mean of cyberbullying scores among the 150 participants was 97.40 (SD = 19.61), which is significantly higher than the hypothetical mean of 68 ($t = 18.360$, $p < 0.01$). These findings confirm that the level of cyberbullying among university students is high.

The elevated level of cyberbullying may be influenced by cultural, social, and psychological factors. Culturally, the finding reflects limited awareness of ethical digital practices and a deficiency in digital media literacy, making aggressive behavior more acceptable online. Socially, weak institutional controls, peer pressure, and the pursuit of self-affirmation within student groups may contribute to cyberbullying behaviors. Psychologically, feelings of anxiety, frustration, or low self-esteem may prompt some students to engage in cyberbullying as a compensatory mechanism. These results are consistent with prior studies (Elizabeth, 2018; Al-Shammari, 2023), though they differ from findings by Al-Basyouni and Al-Harbi (2020), who reported moderate or low levels of cyberbullying.

Hypothesis 2: University Students Have a High Level of Self-Esteem

To evaluate this hypothesis, the arithmetic mean, standard deviation, hypothetical mean, and a one-sample t-test were calculated. The results are presented in Table 11.

Table 11. One-Sample t-Test for Self-Esteem Scale Scores

Relative Weight	Significance Level	t-value	df	Hypothetical Mean	Deviation	Mean	Sample	Variable
80%	0.01	12.814	149	54	10.2016	64.67	150	Self-Esteem

The mean score for self-esteem was 64.67 (SD = 10.20), which is significantly higher than the hypothetical mean of 54 ($t = 12.814$, $p < 0.01$). These results confirm that university students in the study possess a high level of self-esteem.

This high self-esteem may be associated with academic engagement, social support, and personal achievement experiences within the university environment, reflecting a generally positive self-perception among students.

The results of the self-esteem scale indicate that the arithmetic mean for the 150 participating students was 64.67, with a standard deviation of 10.20 and a degree of freedom of 149. A comparison with the hypothetical mean of 54 using a one-sample t-test revealed statistically significant differences at $p < 0.01$. The mean score exceeding the hypothetical value confirms a high level of self-esteem among the students, thereby supporting the corresponding hypothesis.

This finding suggests that university students generally possess a positive self-perception and confidence in their academic and social abilities. The university stage represents a critical period for psychological and social development, during which students pursue autonomy and self-assertion in diverse contexts, thereby enhancing their sense of competence and personal worth. The academic environment, with opportunities for social engagement, experiential learning, and achievement, further contributes to the reinforcement of self-esteem. These results align with prior studies, including Kafawin (2017), which emphasized the role of social encouragement, recognition, and appreciation in shaping self-esteem. Similarly, Qadi (2019), Bin Al-Sayeh (2023), Al-Nuaimi and Abu Eish (2023), and Miri (2023) observed that university students' self-esteem tends to rise due to social support and academic successes achieved during this stage. High self-esteem may function as a protective factor, fostering motivation for learning and enhancing students' capacity to manage academic pressures and adapt to future life demands.

The elevated self-esteem observed may also reflect high academic performance, as self-evaluation often correlates with perceived competence and achievement. Conversely, these results differ from studies by Ali (2021), Al-Samadi and Al-Saud (2018), and Al-Kabir (2024), which reported lower levels of self-esteem attributed to parental challenges in meeting children's needs and exposure to negative social comparisons within the university environment.

Impact of Cyberbullying on Self-Esteem

The third hypothesis examined whether cyberbullying significantly affects university students' self-esteem. To test this hypothesis, simple linear regression analysis was employed to predict self-esteem based on levels of cyberbullying. Prior to conducting the analysis, the assumptions of normality and linearity between the variables were verified.

Table 12. Simple Regression Analysis of Cyberbullying Predicting Self-Esteem

Statistical Significance	t-value	Beta Value	F Significance	F-value	R^2	R	Explanatory Variable	Dependent Variable
0.001	-4.100	-0.614	0.001	16.807	0.102	0.31	Cyberbullying	Self-Esteem

The regression analysis indicates that the model is statistically significant ($F = 16.807$, $p < 0.001$). Cyberbullying accounts for approximately 10% of the variance in self-esteem ($R^2 = 0.102$). The negative Beta coefficient (-0.614) demonstrates a significant inverse relationship, indicating that increased levels of cyberbullying are associated with lower self-esteem. The corresponding regression equation can be expressed as:

$$Y = 137.119 - 0.614X$$

These findings confirm that cyberbullying negatively impacts self-esteem among university students. Repeated exposure to aggressive or hostile online behavior may distort self-perception, encourage excessive self-criticism, and amplify feelings of shame and social rejection, particularly when witnessed by a wider audience.

Prior research supports these results. Studies by Patchin and Hinduja (2010), Hussein and Mahmoud (2021), and Al-Nuaimi et al. (2023) similarly identified cyberbullying as a significant factor reducing self-confidence, diminishing self-image, and increasing social withdrawal among victims. Additional evidence from Igan and Perry (1998) and Kara et al. (2025) indicates that persistent cyberbullying correlates with lower self-esteem, heightened anxiety, and depressive symptoms, which in turn affect academic achievement, social adjustment, and future career prospects. However, these results differ from those of Ahmed (2023), which reported no significant relationship between cyberbullying and self-esteem.

Conclusion

The widespread use of digital media has significantly transformed social interaction patterns. However, excessive engagement in virtual environments has amplified the prevalence of cyberbullying, particularly among university students. The findings of this study highlight the negative effects of cyberbullying on personal, social, psychological, and health dimensions, with low self-esteem emerging as a prominent consequence. Key conclusions from this research include:

- Cyberbullying is prevalent at a high level among university students.
- University students generally exhibit high self-esteem.
- Cyberbullying exerts a negative impact on students' self-esteem.

Recommendations

- Implement comprehensive regulations governing the ethical use of electronic communication platforms and hold offenders accountable.
- Strengthen legal deterrents and impose stricter penalties for cyberbullying to curb its prevalence in university settings.
- Enhance the role of psychological and social support services in promoting awareness and fostering self-esteem among students.
- Organize periodic educational workshops to raise awareness about cyberbullying and its detrimental effects on individuals and society.

Findings

1. **High Prevalence of Cyberbullying:** University students reported a high frequency of cyberbullying behaviors, as evidenced by scores significantly above the hypothetical mean. The phenomenon manifests in multiple dimensions, including cyber-harassment, cyber-defamation, cyber-impersonation, and cyberstalking.
2. **High Levels of Self-Esteem:** Students demonstrated generally high levels of self-esteem, reflecting a positive self-concept, confidence in social interactions, and perceived competence in academic and social tasks. Gender and field of study influenced self-esteem levels, with females generally exhibiting higher scores.
3. **Negative Impact of Cyberbullying on Self-Esteem:** Regression analysis revealed that cyberbullying significantly predicts lower self-esteem among university students. Specifically, an increase in cyberbullying corresponds to a measurable decrease in self-esteem, highlighting the psychological vulnerability of students subjected to online aggression.
4. **Correlation Between Psychological Factors and Behavioral Outcomes:** The study indicates that exposure to cyberbullying is associated with feelings of shame, social rejection, and anxiety, which may adversely affect academic performance, social adjustment, and overall psychological well-being.
5. **Implications for Prevention and Intervention:** The findings emphasize the need for proactive measures, including digital literacy education, psychological counseling, and enforcement of behavioral policies, to mitigate cyberbullying and support the development of healthy self-esteem among university students.

Acknowledgements

The authors extend their sincere gratitude to the students of the Faculty of Social and Human Sciences at Abdelhamid Ibn Badis University, Mostaganem, for their voluntary participation in this study. Special thanks are also due to the faculty staff for facilitating access to the research environment and supporting the data collection process. The authors acknowledge the constructive feedback and guidance received from academic mentors, which significantly enriched the quality and depth of this research.

Ethical Considerations

This study adhered to the highest ethical standards in research involving human participants. Participation in the study was entirely voluntary, and all participants were provided with detailed information regarding the research objectives, procedures, and confidentiality measures. Informed consent was obtained from all participants before data collection. The researchers ensured anonymity and confidentiality by assigning codes to participants instead of using personal identifiers. The study was conducted in accordance with the ethical guidelines set forth by Abdelhamid Ibn Badis University, Mostaganem, and the principles outlined in the Declaration of Helsinki (2013) for research involving human subjects.

Funding

This research did not receive any specific grant or financial support from public, commercial, or non-profit funding agencies. The study was conducted as part of the authors' academic responsibilities and institutional research activities at Djalili Bounaama University.

Novelty of the Study

This study contributes novel insights into the relationship between cyberbullying and self-esteem within the university context in Algeria, particularly at Abdelhamid Ibn Badis University, Mostaganem. While previous research has explored cyberbullying or self-esteem separately, this study integrates both constructs using a descriptive-analytical approach and robust psychometric tools. It highlights the prevalence and psychological implications of cyberbullying on self-esteem among students, providing empirical evidence to inform prevention strategies, institutional policies, and awareness programs. Furthermore, the study extends the literature on cyberpsychology in North African higher education settings, an under-researched context in the global discourse on digital behavior and adolescent well-being.

Conflict of Interest

The authors declare that there is no conflict of interest regarding the publication of this study. The research was conducted independently, and the authors affirm that the findings are presented objectively and without any financial or personal bias.

Keywords burnout; employed women; family obligations; occupational stressors; psychological well-being; work–life balance; emotional exhaustion.

Abstract

This study investigates the phenomenon of burnout among employed women by situating it at the intersection of family responsibilities and occupational stressors. Drawing on a theoretical–analytical framework, the paper examines how cumulative demands from both domestic and professional domains interact to destabilize psychological well-being, erode job satisfaction, and amplify emotional exhaustion. The research highlights the canonical manifestations of burnout—emotional depletion, depersonalization, and reduced personal accomplishment—while contextualizing them within the dual pressures of childcare, eldercare, household management, and professional performance. Findings underscore that burnout among women is not simply the result of isolated stressors but rather of their reciprocal amplification across domains, forming what may be described as a "cross-domain feedback loop" of strain.

The study's expanded analysis contributes threefold: first, by delineating distinct occupational and family antecedents that converge to precipitate burnout; second, by mapping the interactive mechanisms that transform stress accumulation into a persistent syndrome; and third, by proposing multilevel interventions at the individual, organizational, and societal levels. Mechanisms such as family-supportive policies, institutional scaffolding of psychosocial resources, flexible work structures, and self-regulatory strategies are identified as crucial buffers against escalating burnout trajectories. The study calls for a paradigm shift toward integrated psychosocial frameworks that sustain women's dual roles, recognizing burnout as both a workplace health issue and a broader social phenomenon.

Introduction

Burnout is not a marginal topic in psychology or sociology; it is a systemic phenomenon with spillovers that touch the individual, the employing institution, and the social lattice that connects them. Attention to employed women has intensified because the exposure gradient is steeper and the temporal buffer thinner. Multiple roles accumulate; decision and care work expand; effort is rationed across domains that rarely synchronize. One person. Many scripts. The ledger resists balance.

Pressures seldom arrive in isolation; they interact, sometimes quietly, sometimes with visible turbulence. At work, task load compresses time, procedures add friction, and interpersonal climates oscillate with limited scaffolding of support. At home, responsibilities multiply under a constant injunction to keep roles aligned, even as alignment shifts with childcare, eldercare, and domestic logistics. The coupling of these streams accelerates the syndrome's canonical triad: emotional exhaustion, affective blunting, and reduced accomplishment. Motivation contracts. Quality of life declines. For employed women, work and family operate as interlinked systems in which excess demand in one node migrates to the other, and conflict becomes the conduit through which burnout gains momentum.

Prior scholarship signals similar dynamics. Maslach (1984) and Jackson (1976) reported detachment from one's field as burnout consolidates. Bardo and Sarason (1979) described a tenure effect in which prolonged exposure correlates with diminished responsiveness to contextual demands. Hook (1985) catalogued precipitating factors across psychological and social registers. Whether these patterns generalize across sectors, schedules, and care arrangements remains an empirical question; nonetheless, the causal pathways they imply are plausible and testable.

Research Problem

Entry into paid work reorganizes daily architecture and, for women who coordinate household life, reconfigures the emotional ledger as well. Professional stressors arise through workload intensity, procedural barriers, and ambiguous support structures; family stressors arise through continuous care obligations, compressed time, and normative expectations of presence. The composite yields mental and physical fatigue, a persistent anxiety tone, recurrent guilt about missed familial cues, and tension that does not clock out. These layered conditions form a staging ground for burnout. From this vantage point, the paper asks:

- What occupational causes lead to burnout among employed women?
- What family causes are associated with burnout among employed women?
- How does the interaction of family and occupational pressures elevate burnout levels?
- Which mechanisms are viable for limiting burnout among employed women?

Significance of the Study

- Contribute to the development of standardized instruments that assess and manage family and workplace pressures linked to burnout in employed women.
- Promote a constructive stance toward employed women through actionable guidance for confronting or attenuating recurrent stressors at work and at home.
- Offer measures that strengthen women's capacity to regulate these pressures and reduce the cognitive, emotional, and behavioral signatures of burnout.

Objectives

- Identify occupational causes that contribute to burnout among employed women.
- Specify family causes that intensify burnout among employed women.

- Analyze how work–family interaction contributes to rising burnout levels.
- Determine principal mechanisms that help reduce family and occupational pressures for employed women.

Operational Definitions of the Study

- **Burnout.** Defined by the researchers as a state arising from psychological and occupational pressures in which the employed woman perceives herself as unable to cope. A felt limit; the system overloads; capacity to respond contracts.
- **Employed woman.** Any woman—daughter, mother, or spouse—who holds paid work outside the family setting while simultaneously bearing full responsibility for family-related duties. Two fronts, one actor, concurrent obligations.
- **Family stressors.** Defined by the researchers as a set of challenges encountered by the employed woman within her household that adversely affect her mental health and precipitate burnout. Strain accumulates; mood and energy decline.
- **Occupational stressors.** Defined by the researchers as the woman's perception of work-related factors—role conflict, weak professional support, inadequate recognition, and ambiguous responsibilities—that collectively raise the likelihood of burnout. Signals differ, but the trajectory converges: pressure, fatigue, withdrawal.

I. Burnout: Theoretical Grounding

A. Definition

Burnout is treated as a serious outcome of sustained psychological and occupational strain. The construct is relatively recent in scholarly use yet has drawn strong attention in psychology and sociology. The term gained currency in the 1970s and 1980s through the work of Christina Maslach (1976; 1982), a leading voice whose studies clarified the phenomenon across multiple professions. In her formulation, burnout emerges when workers can no longer align themselves with continuous job-related emotional pressure; put briefly, a progressive failure to accommodate ongoing affective demands.

Short version: pressure persists; adaptation stalls.

B. Antecedents

Askar (2000) surveys several precipitating factors:

- **Role ambiguity.** Unclear responsibilities correlate with lower job satisfaction, frequent intent to quit, elevated tension at work, and diminished self-confidence. The person does the task, yet the task will not stand still; responsibilities blur, evaluation drifts, and strain accumulates.

- **Job nature.** Occupations centered on direct care or safeguarding life tend to generate more psychological pressure than primarily clerical posts. Proximity to need increases exposure to moral stressors and time compression.

- **Workload escalation.** Quantity and required skill both matter. Rising load is linked to serious mental and physical problems that degrade performance. Volume, pace, spillover—an additive pattern that behaves like a multiplier.

- **Responsibility for others.** Responsibility is stressful in general; it intensifies where the object is human life, health, or safety, far more than where the object is equipment or tools. The ethical weight itself exerts pressure.

- **Physical conditions.** Heat, lighting, ventilation, noise, and workspace design constitute a material backdrop that can steadily raise strain. Small frictions, repeated often, become large.

C. Core Dimensions

The Jackson and Maslach model remains the reference point, specifying three interrelated facets:

1. **Emotional exhaustion.** A depletion of affective resources distinct from bodily fatigue or cognitive tiredness. It signals an impaired capacity to meet the emotional demands of work because personal resources no longer match situational requirements. Central, often first to appear, and frequently the strongest predictor of downstream outcomes.

2. **Depersonalization (affective blunting).** Creating distance from clients, patients, or colleagues—treating persons as impersonal units—to make demands feel more manageable. The tactic conserves energy short-term yet erodes empathy, contact quality, and professional identity.

3. **Reduced personal accomplishment (efficacy).** A felt inability to invest effort productively or to register one's effort as effective. Energy allocated to problem-solving declines; self-evaluation turns negative; the worker infers "not up to standard," especially in high-contact roles such as nursing. Perception tightens the loop: lower perceived efficacy dampens effort, which then confirms the low-efficacy judgment.

II. Theoretical Framework of Family Stressors

Family stressors refer to the felt strain and tension experienced during interactions with parents, siblings, relatives, and other household members. They also denote the distress arising from events that unfold within family life, the consequence of which is strong emotions that are difficult to regulate.

A. Sources of Family Stress

There are several indicators that family stress is present; principal sources include:

- **Spousal-partner stress.** Harmony, mutual understanding, solidarity, and concord—each prerequisite for change—can themselves generate steady pressure. Sometimes one spouse adapts unilaterally; sometimes the husband does. Deep comprehension of the other's aspirations, emotional needs, and cognitive demands is required, yet practical obstacles routinely impede such concord. From here, pressure surfaces as marital problems linked to unclear roles and ill-defined responsibilities for both spouses—an outcome traceable to the absence of established conventions governing shared participation in daily affairs, including routine, collaborative tasks (Frih Nabila, 2020, p. 101).

- **Child-related stress.** In many cases, an employed woman lacks reliable childcare or supervision for her children during working hours, as well as consistent support in meeting their needs. Husbands frequently cannot assist with childcare while the mother is at work—either due to their own job obligations or a reluctance to assume childrearing responsibilities rooted in psychological, social, or cultural factors (Ihsan Muhammad Hasan, 2008, p. 71).

B. Types of Family Stress

Family stress can be classified into several forms:

- **Psychological stress.** Pressures tied to the emotional–affective life of family members. These arise from the family's internal environment, which functions as the primary site for many stress origins.

- **Internal stressors.** Pressures linked to transactions among family members—that is, events or conditions in which the family's internal system comes into direct contact with the external environment.

- **External stressors.** Pressures originating outside the family system, drawn from the surrounding context, encompassing all events situated at the interface between the family and its environment.

Most researchers converge on the salience of economic stress as a dominant external family stressor. Reduced household income, coupled with successive financial disruptions, exerts pronounced effects because economic crises reshape emotions, behaviors, and relational dynamics inside the family. Housing-related stress is likewise significant:

residential transitions—moves from one place to another—constitute an intense pressure event for all family members. Such relocation often involves reciprocal emotional dependence between spouses, and the change itself heightens overall family stress (Rajjaj, 2013, p. 8).

III. Methods for Addressing Family Stressors

- **Spousal action.** The husband is urged to revise inherited social attitudes that hinder his participation in domestic duties, and to share household responsibilities with his wife—especially as she now contributes to household income and material support.

- **Task sharing during work hours.** When the wife works outside the home, the husband—particularly if not constrained by his own job—should assume household tasks, care for the children, and supervise them until her return. Cooperation in dividing domestic labor and sustaining paid work outside the family sphere is a direct driver of marital success and the stability of the contemporary household.

- **Scheduling by the employed woman.** The employed woman should organize a time table that specifies hours for domestic tasks and for paid work, allocates duties across family members, and balances work periods with leisure and recovery.

- **Public education.** Mass media, educational and training institutions, and civic and professional organizations should educate men about their family and environmental obligations, prompt them to perform these tasks regardless of age, social background, or educational or professional level, and encourage women to cooperate with men in carrying out these responsibilities (Rajjaj, 2013, p. 417).

Synthesis. The woman—half of society, partner in building and maintaining the family, central to childrearing and preparation for social life—has seen her social environment change under economic, social, political, cultural, and intellectual shifts. These changes enabled participation in production across sectors and, simultaneously, highlighted dual responsibility: one role within the household and another in external employment. The outcome is exposure to significant family pressure.

IV. Theoretical Grounding of Occupational Stress

A. Definition

Occupational stress is a persistent feature of organizations; it reaches all members—leaders and subordinates—albeit with varying intensity. Individuals respond differently: for some, pressure catalyzes persistence and task focus; for others, it induces frustration, lowered productivity, and higher turnover, thereby generating organizational difficulties that obstruct goal attainment. In this perspective, occupational stress is defined as a set of person–environment interactions that produce unpleasant affective states such as tension and anxiety (Maouch & Merdawi, 2016, p. 467).

Nicker and Newman define it as a condition arising from the interaction of employees with their jobs, characterized by internal changes that push performance away from its usual level (Madfouni, 2019, p. 13).

B. Sources

Researchers differ on precise determinants, yet agree that pressures emerge from distinct loci that may operate independently or interact:

- **Environment.** External social, political, legal, and economic changes can serve as stress sources.

- **Interpersonal relations.** Work often requires multiple relational ties. These ties may be misused, turning aggressive or conflictual, or marked by political maneuvering that burdens one party. Certain relationships can compromise personal freedom or confidentiality of private information.

- **Material work conditions.** Variations in ventilation, lighting, humidity, high temperature, noise, or exposure to chemical substances such as gases can produce a sustained sense that the job and its setting are

unsuitable; given the tight link between such factors and physical health and safety, they constitute a primary source of work stress (Maher, 1986, p. 59).

C. Effects of Occupational Stress (Al-Ma'shar, 2009)

Employed women encounter multiple forms of pressure during their duties. Some pressures, in moderate range, may correlate with performance gains; others exceed reasonable levels and impair functioning. Hence, effects can be positive or negative.

Positive effects

- **Knowledge and motivation.** Stimulates learning, activates strong motives to carry out tasks, and spurs efforts to meet diverse requirements, including aspirations for self-realization.
- **Social ties.** Reinforces collegial relationships, since pressure often requires ongoing communication and collaboration between the worker and colleagues to confront stressors or prevent organization-wide problems.
- **Timely problem-solving.** Encourages addressing issues at the appropriate moment to complete work efficiently; confronting problems directly increases the likelihood of resolution.

Negative effects

- Work climate dissatisfaction and low morale.
- Deterioration of intra-organizational relations.
- Communication breakdowns driven by role ambiguity.
- Affective disequilibrium.

III. Psychological Burnout among Working Women: An Analytical Reading of Family and Professional Stressors

Scrutinizing household and workplace strain makes it possible to trace burnout's etiology in employed women and identify levers that can realistically blunt its force—thereby preserving equilibrium across both spheres.

A. Domestic Causes

1. **Cumulative household strain**

Spousal friction, childcare demands, interior and exterior psychological strains—all converge. The family role package (mother, wife, daughter, wage-earner) consumes emotional and somatic reserves at a pace that collides head-on with occupational requirements. Duties morph into an endless cognitive-affective load, and burnout is felt, quite literally, in the bones.

2. **Unequal role allocation.**

Despite paid employment, women frequently carry the heavier domestic ledger: cooking, cleaning, caregiving. Performance targets at work remain non-negotiable, yet household obligations do not shrink. The arithmetic fails; coordination falters; advancement stalls; perceptions of unfairness congeal; risk of burnout surges.

3. **Weak intra-family adaptation**

Where no clear task-sharing or cooperative routines exist, the home ceases to be a sanctuary. It becomes a site of ongoing extraction, stripping away the very energy reserves required for recovery. Exhaustion loops back, magnifying depletion.

4. **Over-inflated expectations.**

   Cultural scripts still locate total caregiving responsibility in the woman. Expectations inflate, guilt shadows performance, and the chronic sense of falling short paves a smooth path to burnout.

In this study we contend that the absence of mutual support and cohesion within the household amplifies psychological load; imbalance itself becomes a primary accelerator of burnout.

B. Occupational Causes

1. **Sparse organizational support**

   Structural and psychological resources are often insufficient. Dual-domain challenges therefore remain largely self-managed, with predictable wear-and-tear.

2. **Task stagnation**

   Repetitive assignments, minimal innovation, scarce growth prospects. Monotony weighs almost as heavily as overload; the mind idles, then chafes.

3. **Dual responsibility load**

   Paid work outside, invisible labor inside—health-care errands, emotional tutoring, extended-kin logistics. Focus fragments. Priorities duel: preserve household integrity or meet professional benchmarks (Batoush, 2018, p. 39).

4. **Extended workhours**

   Long shifts stretch cognitive bandwidth, truncate recovery windows, elevate physiological strain. Direct ignition source for burnout.

5. **Inequity and discrimination**

   Wage gaps, stalled promotions, skill-blind reward structures. Same input, diminished return. Material depletion couples with moral injury; boredom blends with resignation; burnout follows (Ahmad Dawood, 2019, p. 09).

C. Interplay of Domestic and Occupational Pressures

1. Work–family conflict as a driver of burnout

Role conflict surfaces when job demands clash with household duties, each claiming urgency yet refusing to synchronize. Rothausen (2009) notes that cultural scripts caricature the "ideal mother" and the "ideal employee" as mutually exclusive ideals; the more roles the woman occupies, the steeper the draw on time, energy, and external resources. Ibrahim et al. (2020) add that genuine work–life balance allows the individual to juggle multiple obligations across home, workplace, and community, but imbalance cuts that flexibility short—burnout follows.

2. Psychological load from rapid role-switching

Continuous toggling—employee, colleague, supervisor, then back to caregiver—imposes cognitive and affective fatigue. Swift integration into teams, constant communication, and accelerated workflow can morph into stressors that erode health, comfort, and performance. Each shift demands behavioral recalibration; repeated recalibration drains reserves.

3. Deficit of social and institutional support

Where backing is thin, the safety net frays. Ibn Aoun and Ammam (2019) show that social support feeds organizational engagement, job security, and psychological steadiness; its absence strips employed women of a buffer against professional and emotional strain.

D. Theoretical Explanations of Burnout in Employed Women

1. Spillover–extension theory

Work and family domains leak into one another. Positive spread occurs when satisfaction and vigor at home energize workplace experience; negative spread emerges when conflict-laden duties or depleted energy migrate across the boundary, triggering exhaustion that blocks constructive participation in family life (Adisa et al., 2016, p. 733).

2. Role theory

Socially scripted positions—worker, spouse, parent, colleague—carry normative expectations. Cohesion hinges on fulfilling these concurrent functions; burnout ignites when incompatible demands mandate synchronous performance of two or more roles (Madsen & Hammond, 2005, p. 153).

3. Identity theory

Work–family strife threatens self-definition. Each domain imposes standards; collision of standards obstructs self-actualization and precipitates occupational stress. The tension acts as a perceived assault on identity because professional activities are curbed by household obligations and vice versa (Madsen & Hammond, 2005, p. 154).

The theories form a lattice: spillover tracks directional flow of affect and energy; role theory catalogues the structural clashes; identity theory frames the subjective stakes. Together they clarify why domestic–work misalignment can spiral into burnout for employed women.

Mechanisms for Reducing Family and Occupational Pressures on Employed Women

Relief requires a multi-level scheme, staged rather than singular, with actions inside the household and within the workplace that speak to the same load from different angles.

1) Family level

- **Fair allocation of household roles:** Family members share domestic responsibilities in explicit, workable partitions; load is distributed, not assumed.
- **Strengthening family communication:** Conflict is addressed with skills that de-escalate, clarify, and settle disputes, thereby stabilizing the home setting.
- **Structured family time:** A shared timetable organizes tasks, prevents role collisions, and dampens day-to-day pressure.
- **Recognition and moral support:** The employed woman's contributions are acknowledged within the family; appreciation functions as a psychological buffer.

2) Occupational level

- **Supportive work climate.** Improve professional relationships; cultivate cooperation and credible recognition.
- **Organizational justice.** Ensure equitable pay and formal acknowledgment of effort.

- **Work flexibility:** Apply flexible arrangements or reduced hours where exceptional circumstances make such adjustments necessary.

- **Professional development:** Open advancement paths to counter stagnation and sustain motivation.

- **Stress-management training:** Workshops or programs that equip women to adapt in their workplace context (Jacques Orsoni, 2006, p. 381).

We think that implementing such strategies is critical: satisfaction rises, adverse health effects of pressure recede, and the prospect of balance between private life and professional life becomes materially achievable.

Conclusion

The study's treatment of burnout in employed women shows a pattern that is cumulative rather than singular: the phenomenon is not the artifact of one trigger, but the product of an active interplay between family pressures and workplace demands. This interlacing keeps women in recurrent confrontation with challenges that drain psychological and physical reserves and alter performance quality. By analyzing these facets together, the study obtains a clearer view of antecedents and pathways. The implication is direct: interventions must operate at multiple levels—organizational and familial—to thin the weight of dual burdens. On that basis, the researchers advance the following recommendation :

- Enhance psychological support programs in institutions.

- Encourage the principle of equal opportunity in sharing family roles to lighten the burden on employed women.

- Provide flexible policies, particularly regarding work schedules, aligned with the circumstances of employed women.

- Raise awareness within the family of the importance of support and assistance in reducing burnout.

- Support initiating associations that offer psychological and social counseling services for employed women.

- Encourage in-depth applied studies that connect occupational and family pressures with burnout.

Findings (Summary of Theoretical–Analytical Insights)

• Occupational burnout among employed women is closely tied to workload intensity, procedural ambiguities, and insufficient institutional support.

• Family-related burnout factors include disproportionate care responsibilities, temporal compression, and societal expectations of role performance.

• The interaction between family and occupational stressors is not additive but multiplicative, creating an amplified risk profile.

• Mitigation requires structural, cultural, and psychological strategies, including employer-driven flexibility, shared domestic labor, and mental health interventions.

Ethical Considerations

This study was conducted in alignment with ethical guidelines for psychological and social research. Although the present paper is theoretical–analytical, the review of existing empirical data respects principles of academic integrity, proper citation, and non-disclosure of private or sensitive information. No human subjects were directly involved; hence, ethical clearance was not required.

Novelty and Contribution

The originality of this study lies in its integrated approach to analyzing burnout as an interdependent phenomenon across two domains—family and occupation. Unlike previous studies that often treat stressors in isolation, this paper frames burnout as a systemic psychosocial condition, highlighting feedback loops that exacerbate women's vulnerability. Furthermore, it advances recommendations for developing standardized instruments to assess cross-domain stress interactions and offers policy-level interventions relevant to both employers and family institutions.

Funding Statement

The authors declare that this research received no specific grant from any funding agency, commercial entity, or not-for-profit organization.

Acknowledgments

The authors would like to thank the University of Biskra and 20 August 1955 University, Skikda, for their academic support and access to institutional resources that facilitated the development of this study. Special acknowledgment is extended to colleagues from the Laboratory of Psychological and Social Studies for their constructive input and intellectual engagement during manuscript preparation.

Conflict of Interest Statement

The authors declare no conflict of interest related to the preparation, analysis, or publication of this manuscript.

Keywords Vital Energy; Spirit; Social Behavior; Intention; Emotional Equilibrium; Quranic Patterns; VREBIS System; Integrative Sociology

Abstract

This article introduces the Theory of Spiritual and Vital Integration (SVI) as a novel sociological framework that addresses the limitations of classical paradigms in explaining human social behavior. Traditional sociological models—positivist, structural-functionalist, and interpretive—are criticized for their reductionism, as they focus primarily on measurable social or cognitive factors while overlooking hidden spiritual and energetic dimensions of human interaction. To overcome this gap, the study develops the VREBIS system (Value-based, Reflective, Energetic, Behavioral Intelligence System) as a conceptual and operational model. VREBIS emphasizes the interaction between values, self-reflection, vital energy, and integrative intelligence within social settings.

The methodology adopts an interpretive-constructivist approach, combining reflective interviews, self-energy tracking, and semantic analysis of Quranic texts. Applied examples in education, family life, and mental health demonstrate that VREBIS supports improved cooperation, emotional resilience, conflict resolution, and psychological balance.

The study's findings confirm that human beings operate within a field of "Energetic-Value Consciousness", where spiritual values and biofield energy regulate social interactions. This work advocates for a sociological paradigm that integrates spirit and energy into mainstream theory and practice.

1. Introduction

Classical and contemporary sociology face growing criticism for their reductionist tendencies. They predominantly explain social phenomena through material or quantifiable elements—such as class, institutional structures, or linguistic symbols—while largely overlooking a fundamental reality : that the human being is not

merely a rational social actor, but also a spiritual and energetic entity. This entity embodies intentions, values, and emotions, and both emits and receives subtle vital signals that influence the quality of its interaction with others.

A number of thinkers argue that social phenomena cannot be reduced solely to structures ; they are also influenced by the intentions, meanings, and emotions individuals harbor (Sayer, 2011). Concurrently, emerging research in energy medicine suggests that biofield energy—such as the electromagnetic fields surrounding the body—plays a crucial role in health and behavior, yet remains "poorly understood within the prevailing mechanistic paradigm" (Rubik et al. 2015).

From this standpoint, this study aims to introduce a novel theory that reinstates the spiritual and vital dimensions as essential to understanding social interaction. The core hypothesis is that social behavior cannot be adequately analyzed without studying the equilibrium between an individual's vital energy and their spiritual values. This theory is operationalized through a practical framework known as VREBIS (Value-based, Reflective, Energetic, Behavioral Intelligence System), which structures the relationship between values, energy, and self-awareness, translating them into implementable practices.

2. Theoretical Background : The Limitations of Classical Sociological Models

• The Positivist Paradigme :

The classical positivist paradigm,as seen in the works of Auguste Comte and Émile Durkheim, is grounded in treating society as an entity analyzable through scientific, generalizable laws. While powerful in explaining regular behavioral patterns, this model fails to account for phenomena beyond observable facts, particularly those pertaining to intention, faith, or energetic awareness. Sayer (2011) contends that it is erroneous to believe social phenomena are explained solely by overt social processes; there is always a deeper level of meaning and motivation. By analogy with biomedicine, the positivist paradigm overlooks elements like intention or vital energy, which play a fundamental role in processes of healing or interaction.

• Structural-Functionalism:

Structural models view society as a structure of roles and institutions interacting in a state of equilibrium.While they acknowledge cultural values as part of the social system, they treat religion and spirituality as merely symbolic phenomena or tools for cohesion. They fail to penetrate the depth of spiritual experience or its live impact on an individual's psychic and behavioral energy. In his analysis of religion, Durkheim viewed faith as a reflection of society venerating itself—that is, religion is explained only as a collective social phenomenon, not as a genuine existential connection or energetic field. Consequently, this approach cannot explain individual phenomena such as spiritual transformation, charisma, or the psychological euphoria resulting from a pure spiritual state.

• Interpretive Sociology:

Interpretive sociologists,such as Max Weber and the phenomenological school, focus on the subjective meanings individuals attribute to their actions. This represents a significant advance over positivist models. However, even this approach remains confined to the symbolic or cognitive dimension. Beliefs are analyzed as intellectual systems, not as forces that influence energy flow or the quality of physical interaction. In Weber's verstehen (interpretive understanding) method, we find no tools that enable the researcher to interpret the effect of prayer on inner peace, or how faith translates into cardiac coherence or emotional response. Thus, interpretation remains symbolic, not vital or energetic. Furthermore, interpretive sociology lacks the capacity to explain states that actors themselves cannot fully articulate in words, despite feeling their profound internal impact.

• Synthesis of this Section :

All three paradigms,despite their differences, exclude a fundamental dimension of human experience:

· The Positivist model marginalizes spirit and meaning.
· The Structural-Functionalist model disregards individual will and intention.
· The Interpretive model lacks the tools to understand non-verbal vital energy.

This study calls for a more holistic sociology that reinstates both spirit and energy within an integrated framework for explaining social behavior, which we will present in the following section.

3. The Theory of Spiritual and Vital Integration : Foundations and Components

• The General Conceptual Perspective

The theory is founded on a central hypothesis:human behavior stems not only from social or cognitive factors, but from a continuous interaction between spiritual values and the vital energy inherent in the body. From this

perspective, the human being exists within a field of "Energetic-Value Consciousness» ; that is, the self is composed of a consciousness oriented towards values, and a vital energy that is both influenced by and influences this orientation.

For instance, an individual who holds the value of compassion may feel a warmth or openness in their chest when practicing empathy. Conversely, anxiety or malice might manifest as muscular tension or constriction in the body. These changes are not merely psychological affections ; they are genuine energetic expressions that, in turn, affect the nature of social interaction.

• **The Bio-Energetic Dimension**

This dimension draws upon the concept of biofields as discussed in modern energy medicine.Rubik et al. (2015) define the biofield as "a complex, energetic field responsible for regulating the dynamic homeostatic balance of the living organism." This implies that the body not only produces energy but also emits and receives subtle energetic signals, which may be electrical, magnetic, or non-visible as in concepts like prana or qi.

Research by Alexander Lowen (1975) demonstrated that chronic muscular tensions represent a defensive armor that represses emotions and impedes energy flow, negatively affecting vitality. When anger or grief is suppressed over long periods, the body exhibits signs such as a stiff neck or a constricted chest. Socially, this translates into defensive, aggressive, or withdrawal behaviors.

The Spiritual-Value Dimension

The human being is not merely a biological entity; they harbor an internal system of values and meanings that constitutes their inner compass. Here, spirituality does not necessarily refer to religious affiliation, but encompasses any dimension related to meaning, purpose, and connection to a reality transcendent to material existence.

Within the VREBIS framework, these are referred to as "Core Values," which serve as sources guiding action and interaction: such as patience, honesty, gratitude, and compassion These values are not merely symbolic; they transform into a "spiritual intelligence" that directs action from within. Research by Pinto et al. (2022) concludes that spiritual intelligence is a trainable and developable capacity, allowing individuals to utilize spirituality to enhance their engagement with reality and solve problems with flexibility and meaning.

• **Integration and Reflexive Awareness (Reflexivity)**

The connecting element in the theory is reflexive self-awareness; that is, the human capacity to observe their internal state—in terms of both values and energy—during the very moment of social interaction. The VREBIS system terms this skill "Reflective Energetic-Value Intelligence." It is the ability to monitor emotions, values, and energy, and subsequently adjust behavior accordingly.

For example, when a person feels anger, they can consciously invoke the value of forgiveness, employ a breathing or meditative exercise to rebalance their energy, and then act calmly. Consequently, the social action results from an internal harmony between spirit and energy, rather than from random reactions or unseen disturbances.

• **The Components of the Theory as Presented by the VREBIS System** :

1. **The Core of Spiritual Values :** Encompasses the beliefs, principles, and ultimate purposes that give behavior its meaning.
2. **The Bio-Energetic Field** : Involves the flow of energy within the body and its interactions with emotions and behavior.
3. **Reflexive Awareness:** The capacity for self-monitoring during interaction and adjusting behavior to maintain equilibrium.
4. **Integrative Intelligence** : The skill of synthesizing value perception and energy management to achieve harmonious action.

According to this perspective, the quality of social interaction is hypothesized to be influenced by the degree of alignment between these dimensions. When individuals' values converge and their energetic fields resonate, the interaction tends to be harmonious, and vice versa.

4. The VREBIS System : Structure and Application

• System Structure

VREBIS (Value-based, Reflective, Energetic, Behavioral Intelligence System) represents the practical tool that embodies the Theory of Spiritual and Vital Integration. This system is presented as a multi-stage model, enabling practitioners in fields such as education, therapy, or social counseling to analyze the dynamics of human interaction and redirect them towards internal balance and social openness.

The system can be visualized as a set of interconnected circles or intersecting fields, organized around a central axis—the embodied, conscious Value—surrounded by pathways of Energy, Self-Awareness, and Behavior.

• Core Stages of the System

1. Identifying Core Values :
The work with VREBIS begins with individual or group sessions to identify the values each participant holds (e.g. compassion, respect, responsibility). This exercise can be supported by referencing religious texts, cultural sources, or life experiences. The goal is to build a personal or collective "values map" that serves as a reference point when analyzing interaction.
2. Mapping the Energetic Landscape:
Participants are asked to track their energetic states throughout the day—such as feelings of constriction, vitality, or heaviness—and record them on charts. This process is sometimes supported by physiological indicators like heart rate variability or muscle tension levels. This exercise draws on observations by Alexander Lowen, who considered chronic tensions to be a "psychosomatic armor" that impedes the flow of energy and vitality.
3. Individual and Collective Reflective Meditation:
Sessions of reflective review are conducted, where individuals analyze how their values interacted with their energetic states in specific social situations. These sessions rely on "reflective interviews," which focus not only on evaluating what happened, but also on how it was understood and what it meant for the participant. Pessoa et al. (2021) indicate that this type of interview stimulates participants to reconstruct the experience, rather than merely narrate it.
4. Formulating an Applied Action Plan :
Individual or collective plans are formulated to restore balance, utilizing tools such as breathing exercises, meditations, reinforcement of positive intentions, or value-based group rituals. For instance, if a teacher notices the classroom energy is charged with tension, they might activate a "collective intention" exercise combined with calm breathing to invoke the value of "respect," thereby restoring overall harmony.

• System Function

VREBIS integrates the following elements:

· Spiritual Values (The internal compass for behavior).
· Vital Energy (The state of the body and its surrounding field).
· Self-Awareness (The capacity for observation and adjustment).
· Behavioral Intelligence (The ability to make decisions congruent with one's inner state).

Thus, the system becomes a diagnostic and guiding tool that helps understand why interaction breaks down in a specific situation and how it can be restored by rebuilding the individual's or group's energetic-value equilibrium.
Methodology: A Multi-Tool Interpretive-Structural Approach

Studying the relationship between values and bio-energy necessitates a non-traditional methodological approach, one that respects the complexity and multi-layered nature of human experience. Consequently, this study adopts an Interpretive-Structural methodology, which integrates:

· An Interpretive dimension to understand the meanings, motivations, and values as expressed by the individual.
· A Structural dimension to analyze recurring patterns, the connections between psychological structure, social environment, emotions, and behavior.

Core Research Tools

1. Reflexive Interviews :
These are used not merely as a data collection tool,but as a shared reflective space between the researcher and the participant. Participants are encouraged to delve deeply into their experiences, recalling their stances, emotions,

and internal state transitions. The interviews employ open-ended questions and sometimes use religious or value-based texts to stimulate reflection.

As Pessoa et al. suggest, this type of interview allows the participant to "share the meanings that shape their reality, rather than being interpreted solely from the outside," which aligns with the objectives of the VREBIS system in constructing meaning subjectively.

2. Energetic Self-Tracking Cards:

Participants are asked to complete daily logs where they record their energetic state (e.g. active, contracted, scattered), their emotions, and the situations that influenced them. Simple biological indicators (such as heart rate) can also be incorporated if devices are available.

This data allows the researcher to observe subtle shifts in energetic balance and connect them to social or value-based contexts. It is also used to analyze the relationship between internal stability and the quality of interaction with one's environment.

3. Semantic Analysis of Quranic Texts:

Given that the theory is grounded in spiritual values,Quranic verses addressing the Nafs (self), Qalb (heart), intention, mercy, patience, and other concepts are analyzed using a hermeneutic approach that links them to daily experience. The text is not treated solely as a religious source, but as a value-based map expressing the cultural structure of the individual and the community.

This analysis helps in understanding how participants activate values in their practical lives and how these values manifest in their behavior and energetic state.

4. Conscious Observation :

This tool is used in group contexts,where the researcher observes non-verbal interactions among participants, such as body tension, tone of voice, movement harmony, or signs of energetic disconnection. This instrument complements subjective data and helps in understanding "what is left unsaid but is felt."

Analysis and Interpretation

Data is analyzed on two levels:

· **Subjective Value-Based Interpretation**: To understand how participants express their relationship with their values and how these values influence their emotional and physical-energy states.
· **Structure of the Value-Energy Spectrum** : To identify recurring patterns, such as a drop in energy when a value is violated, or a surge when a value is lived with sincerity.

The methodology does not rely on quantitative generalization, but on deriving interpretive models that can be applied through a profound understanding rooted in lived experience.

6. Practical Applications and Field Results

Although the VREBIS system is newly applied, preliminary case studies have demonstrated its broad potential for interacting with social contexts and achieving qualitative results in the fields of education, family therapy, and mental health. Below are some practical applications :

First : In the Field of Education (Schools)

A field experiment in a middle school involved integrating short VREBIS sessions before group activities.These sessions included:

· A collective declaration of a chosen value (e.g. respect).
· Calm, collective breathing exercises.
· Setting a shared intention to work harmoniously.

Teachers observed that conflicts (such as physical fights or verbal abuse) decreased by an estimated 30% during the weeks the system was implemented, compared to prior weeks. This finding intersects with the results of Zenner et al. who found that mindfulness meditation programs in schools contribute to improved cognitive performance and reduced stress among students.

Furthermore, some students expressed in interviews feeling "warmth" and "comfort" during cooperation, indicating that the collective energetic field was positively influenced by the practice, leading to more harmonious social interaction.

Second : In Family Relationships

In family therapy sessions,VREBIS was used to help two siblings overcome a chronic conflict.

Initially, each sibling expressed their core values (one valued freedom, while the other prioritized security).
They were trained to track their physical and emotional signals of stress during disagreements.
Subsequently,they jointly discussed a Quranic verse about brotherhood and reflected on its personal meaning for them.

Over time, each began using simple breathing techniques when angry and consciously invoked the value of "kindness" to guide their behavior The family noted that conflicts transformed into brief discussions, thanks to this new sensitivity to exchanged "energetic signals" and the conscious invocation of shared values.

This outcome aligns with the perspective of Walsh, who posits that spirituality represents a vital dimension in family life, serving as a source of cohesion, recovery, and resilience in facing crises.

Third: In Psychological Care and Mental Health

Within clinical psychology settings, practitioners have reported that integrating spiritual beliefs and energy-based exercises into treatment plans has improved outcomes for certain clients. For instance, individuals struggling with anxiety or grief were encouraged to express their emotions through physical movement—serving as a form of emotional and energetic release—and to invoke spiritual values such as contentment or hope through prayer or quiet meditation.

This integrative approach contributed to measurable reductions in anxiety indicators, enhanced overall mood, and facilitated greater emotional acceptance. These observations align with the review by Koenig, which indicates that spiritual engagement serves as a powerful source of "comfort, hope, and meaning" when confronting psychological distress.

Summary of Findings:

Across all three case studies, the VREBIS framework provided a qualitative explanation for the observed improvements that traditional approaches might overlook. Rather than simply noting that "pupils' behavior improved," VREBIS reveals that this change occurred due to a rebalancing of intention, energy, and values. Furthermore, the system allows practitioners to detect situations where superficial harmony is fragile because the underlying energetic field remains tense or unsettled.

7. Conclusion and Recommendations

The theory of "Spiritual and Bio-Energetic Integration in Social Interaction," along with its applied VREBIS framework, offers a theoretical and methodological contribution aimed at renewing sociology from within. It does so by reinstating the importance of often-invisible dimensions of human experience: values, intention, and bio-energy.

First: Challenging Sociological Reductionism

The theory reveals the limitations of traditional models that focus either on structure (like functionalism) or meaning (like symbolic interactionism), without addressing what occurs within the individual—a being who feels, reflects, and interacts according to their spiritual state and internal energy. Consequently, it advocates for moving beyond the duality of agency and structure toward an integrated understanding of the social actor as a conscious, value-driven, and energetic entity.

Second : Conceptual and Practical Contributions

On a conceptual level, the theory opens a new field of inquiry—a sociology of values and energy—and introduces novel variables such as energetic harmony, value fluctuation, and interactive intention.

On a practical level, VREBIS serves as a flexible tool applicable in education, family counseling, therapy, and social work. It enables the development of practical strategies that help individuals restore their internal equilibrium and enhance the quality of their social interactions.

Third: Avenues for Future Research

· Empirical Validation : Through quantitative and qualitative studies comparing groups that have implemented the VREBIS system with control groups that have not.
· Contextual Expansion : Adapting the framework to different religious and cultural contexts (e.g., Islamic, Christian, Buddhist).
· Interdisciplinary Integration: Bridging sociology with neuroscience, biophysics, or energy psychology to better understand the relationship between values, energy, and behavior.

Final Conclusion

This work reopens a vital horizon for sociology by reconnecting that which has been disconnected: the spirit and society, the energetic field and the social body, and abstract values with embodied behavior. The VREBIS system represents a prototype for this necessary integration and stands as an open invitation for researchers to test, refine, and expand this direction of inquiry.

Findings

- Integration of dimensions: Results highlight that spiritual values and vital energy are inseparable from social decision-making and interpersonal communication.
- Practical applications: Implementation of VREBIS in family counseling and education enhanced cooperation, reduced interpersonal conflicts, and improved psychological balance.
- Theoretical advancement: The research bridges sociology with insights from energy medicine and spirituality, providing a transdisciplinary platform.

Novelty of the Study

This study introduces the first integrative sociological model (VREBIS) that systematically combines values, reflection, energy, and intelligence. Unlike traditional frameworks that marginalize non-material aspects of human behavior, VREBIS legitimizes spiritual and energetic factors as central explanatory variables in social sciences.

Ethical Considerations

All interviews and qualitative data were collected with informed consent, ensuring confidentiality and voluntary participation. Religious and spiritual references (including Quranic texts) were analyzed with cultural sensitivity and respect for participants' beliefs.

Acknowledgments

The author expresses sincere gratitude to the colleagues and students of Hamma Lakhdar El Oued University for their valuable insights during reflective interviews. Special thanks to the research participants who generously shared their personal experiences of spiritual and energetic practices.

Funding Statement

This research received no external funding. The study was conducted as part of the author's independent academic work at Hamma Lakhdar El Oued University.
Conflict of Interest
The author declares no conflict of interest regarding the publication of this article.

Keywords Witchcraft; Sorcery; Penal Code; Law No. 24-06; Criminal Policy; Legal Reform; Algeria; Spiritual Exploitation; Fraud; Cultural Security.

Abstract

The phenomenon of witchcraft and sorcery remains deeply rooted in various societies, including Algeria, where it continues to affect the moral, psychological, and spiritual security of individuals. Despite its historical association with superstition, ignorance, and the exploitation of vulnerable persons, the legal system lacked explicit provisions addressing this issue until the promulgation of Law No. 24-06, which amended and supplemented Ordinance No. 66-156, the Algerian Penal Code. This legislative development marked a decisive transformation in Algerian criminal policy, formally criminalizing witchcraft and sorcery through Articles 303 bis 42 and 303 bis 43.

This paper provides a comprehensive legal, sociological, and analytical study of this legislative shift. It explores the conceptual foundations of witchcraft and sorcery, traces their historical evolution, and evaluates the adequacy and effectiveness of the new penal provisions in addressing these crimes. The study also examines the linguistic, terminological, and juristic dimensions of witchcraft within both Islamic and comparative legal frameworks, emphasizing the balance between legal certainty and cultural sensitivity.

Findings reveal that the criminalization of witchcraft under Law No. 24-06 represents both a legal innovation and a moral necessity, aligning Algerian law with international norms on protecting citizens from psychological exploitation and fraudulent spiritual practices. The paper concludes by offering recommendations for improving legal implementation mechanisms, enhancing judicial awareness, and developing preventive strategies through education and community engagement.

Introduction:

The phenomenon of magic and sorcery is widespread in various societies, despite its long association with ignorance, superstition, and the exploitation of deceived minds, threatening individuals' spiritual and psychological security and exploiting their emotions and psychological state to turn them into illicit gains. Despite efforts to combat this phenomenon through awareness-raising, the legal framework remained lacking explicit provisions criminalizing these acts until the latest amendment to Penal Code No. 24-06, amending and supplementing Decree 66-156.[1] These important amendments addressed the shortcomings of Article 456 of the Penal Code, which contained legal loopholes that facilitated impunity because it did not explicitly and publicly criminalize magic and sorcery. This prompted the Algerian judiciary to resort to applying Article 372 of the Penal Code, which deals with the crime of fraud and deception when its elements are present. Given the widespread phenomenon of witchcraft and sorcery in Algerian society, the legislature introduced fundamental amendments to Penal Code No. 24-06, marking a significant turning point in this regard. Articles 303 bis 42 and 303 bis 43 explicitly criminalize the crime of witchcraft and sorcery.

Hence, the question arises: **How effective are the penal provisions enacted by the Algerian legislature in reducing the crime of witchcraft and sorcery?**

To answer this question, we adopted an analytical approach to analyze all the legal texts related to this topic, in addition to a descriptive approach.

The research paper was divided into two sections as follows:

The first topic: The conceptual framework of the phenomenon of witchcraft and sorcery

The second topic: The Legal Framework for the Crime of witchcraft and Sorcery

The first topic: The Conceptual Framework of the Phenomenon of witchcraft and sorcery

In order to study the conceptual framework of the phenomenon of magic and sorcery, we will examine the concept of the crime of magic and sorcery (Section One), followed by a study of the historical development of the spread of this phenomenon (Section Two).

First requirement: The Concept of the Crime of witchcraft and sorcery .

Before addressing the legislative aspect of the crime of witchcraft and sorcery, it is necessary to address the theoretical aspect of the phenomenon in general by providing a precise definition of the phenomenon (Section One). Then, we will identify the reasons for the widespread prevalence of this phenomenon, which has spread horribly in various societies, such as Algerian society, and highlight its most significant harms (Section Two).

The first section: Definition of witchcraft and Sorcery.

The definition of magic and sorcery is determined by its linguistic, terminological, and legal definition.

First: The linguistic definition of witchcraft and sorcery.

Many meanings of magic and sorcery are mentioned in Arabic dictionaries, and linguists have differed and diverged in their opinions. Ibn Faris's "Miqyas al-Lughah" and al-Wahidi's "Tafsir" state:

[1] -Law No. 06-24, dated April 28, 2004, Official Gazette, No. 30, issued on April 30, 2024, amending and supplementing Decree No. 156-166 containing the Penal Code.

Magic, linguistically, is the act of diverting something from its intended purpose. Arabs say, "What has bewitched you from such-and-such?" meaning, "What has diverted you from it?" It is as if the magician, by making falsehood appear as truth, has bewitched something from its intended purpose.[1]

"He has bewitched," "He has bewitched," "Tashyran," "Fawwa muṣḥir," and the object is bewitched.

He bewitched his guests by offering them suhoor (pre-dawn meal). As stated in the Arabic Dictionary:

"Sahar" means to bewitch someone, to bewitch him time and time again until his mind is confused: "They said, 'You are only one of the bewitched.'"[2]

As for sorcery, its definition in Lisan al-Arab by Ibn Manzur is:

"Sha'wadhah: sleight of hand and a trick like magic, making something appear other than it is. Its origin is in the eye; a man is a "mush'awwidh" and "mush'awwidh," and it is not from the speech of the desert.

"Sha'wadhah" means speed, and it has also been said that it means lightness in any matter.

"Sha'wadhi" means the messenger of princes on their missions by mail, and it is derived from this word due to its speed.

Al-Layth said: "Sorcery and magic are used and are not part of the speech of the Bedouins." [3]

Second: The Technical Definition of witchcraft and Sorcery

Ibn Khaldun defined magic and sorcery as: "The science of how human souls are capable of influencing the world of elements, either without a source or through a source of heavenly influence."[4]

As for sorcery, the technical definition is defined as: suspicious, illusory actions and movements coupled with sleight of hand, such that things are perceived as other than what they are.[5]

Third: The Legal Definition of witchcraft and Sorcery

By referring to the text of Article 303 bis 42 of the Penal Code, paragraph four, we find that the Algerian legislator provided a legal definition of magic and sorcery. In this article, magic and sorcery are intended to instill hope or fear in the occurrence of an event or any other imaginary event, by deceiving one with imaginary power or authority, or by assuming a false identity. Divination or prophecy are considered to be acts of magic and sorcery.[6]

Thus, the Algerian legislator has filled the legislative gap and the ongoing controversy surrounding this issue. Crimes and the acts that fall under their definition are not subject to interpretation, which is consistent with the principle of the legality of crimes and punishments. These acts were included in the text of the repealed Article 456, which criminalized the profession of fortune-telling, predicting the future, and interpreting dreams. Sometimes, the judiciary resorts to other texts to criminalize these acts, such as Article 160 regarding the desecration of the Holy Qur'an, as well as crimes related to cemeteries and the sanctity of the dead.[7]

The second section: The Reason for Criminalizing witchcraft and Sorcery

Magic and sorcery are dangerous methods that have long destroyed people's lives and caused harm to others, both psychologically and materially.

[1] See "Miqyas al-Lughah" by Ibn Faris (3/138), "Al-Tafsir al-Basit" by al-Wahidi (3/193).

[4] Abd al-Rahman Ibn Khaldun, Al-Muqaddimah, Part 5, House of Arts, Publications, and Literature, Casablanca, 1st ed., 2005, p. 251.
[5] Bouhentalah Yassin, Dhibih Hisham, Criminalization of Acts of Witchcraft and Sorcery in the Algerian Penal Code, Tabna Journal of Academic Scientific Studies, 7, No. 2, p. 775.
[6] 303 bis 42 C. the Algerian Penal., op. cit.
[7] Bohentalah Yassin, Dhibih Hisham, op. cit., p. 776.

First: The Family Level

On the family level, magic has long threatened and contributed to harmful effects, primarily manifested in:

- Separation of marriages

- Exploitation of children in search of worldly treasures

- Spreading enmity among family members, the foundation of society, which leads to the spread of hostility within it

- Harming children through sorcery

- The head of the household leaving the home

- Accelerating marriage ceremonies despite the disapproval of one party.[1]

Second: On the personal level:

The harms of magic on the personal level are primarily:

- Using magic to cause someone to lose their job

- Using magic to destroy someone's life[2]

- Sexual exploitation for therapeutic purposes

- Taking people's money by deception

- Using human organs for the purpose of magic

- Making a person psychologically unstable

- Using drugs and intoxicants to deceive people in exchange for money.[3]

Third: On the religious level:

Magic harms the five objectives of Islamic law, as follows:

1- The purpose of preserving religion

Magic is religiously forbidden because of the religious and worldly harm it causes. It is a major sin and constitutes disbelief and polytheism in God Almighty by resorting to jinn and devils instead of supplication, prayer, and worship.[4]

2- The purpose of preserving life

This harm is manifested in illness, insanity, and outright assault on the human soul.

3- The purpose of preserving the mind

The human mind is the foundation of life and the responsibility of every responsible person, so what about someone who causes it? Destroying a person's mind solely for personal gain, whether by making them insane or suffering from any mental illness, neglecting their public appearance, or destabilizing and unbalancing them.[1]

[3] Hajjaj Reda, Maash Nasreen, op. cit., p. 610.
[4] Sidra Al-Sharif Mustafa Muhammad, Yaqoub Ali Salem Al-Mashifri, Bouhamda Ghalia, op. cit., p. 73.

4- The Purpose of Preserving Life

This involves violating the purpose of preserving life with regard to offspring, honor, and lineage, whether through moral ugliness, aggression, blind jealousy, infertility magic, preventing marriage, plagiarism, abortion, etc.[2]

5- The Purpose of Preserving Money

The purpose of preserving money is to unlawfully take people's money and prevent them from working. There is a type of magic that can make a person wasteful and foolish. There are many ways magicians steal money, as this is their primary goal.

The second requirement: The Historical Development of the Phenomenon of witchcraft and Sorcery

Given that magic and sorcery are a social phenomenon that spans time and space, this phenomenon has spread and evolved over the ages in various parts of the world. This necessitates providing a historical overview of its development across the ages, beginning with ancient civilizations (section one) and continuing to its development in modern civilizations (section two).

The first section : witchcraft and Sorcery in Ancient Civilizations

The phenomenon of magic and sorcery was widely used in ancient civilizations in all matters and in all fields.

First: witchcraft and Sorcery among the Babylonians

The Babylonians were among the first nations to practice magic, which relied on the planets. They worshipped the seven planets, worshipped them through acts of worship, and called them gods. They believed that all worldly events were the work of the planets. They based their magical practices on the movements of these planets, their timing, their alignment, their distance, and everything related to them, based on their firm belief in their influence on human life. The Persians also practiced magic and relied on the stars to achieve their victories. Historians mention that Khosrow's banner, called "Zarqash Kuyan," was inscribed in gold by magicians, according to their instructions, and the numerical horoscopes were inscribed in specific astronomical positions. The purpose was to ensure the stability of the Persians' victory in all the battlefields they waged against their neighbors and enemies. [3]

Second: witchcraft and Sorcery among the Egyptians

Ancient Egypt is considered the cradle of human civilization and the most advanced of human civilizations, and a home for arts and industry in all their forms[4]. However, it was also famous for its heavy reliance on magic. It is said that Egyptian markets were teeming with sorcerers, and magic was the exclusive domain of kings and priests, excluding other classes of society. This facilitated the subjugation of other classes and their obedience to the ruling class in the name of sorcerers[5]. One of the effects of this was the temple's control over magical affairs, and priests were present at night after calm had prevailed in the city and deserts to beg their gods and perform their magical rituals, incantations, and talismans. They often relied on magic for their natural healing, seeking healing from all ailments. Cazeneuve says: "Rituals in general, whether magical or religious, are symbolic acts, and symbols are related to what they symbolize; both are linked to feelings and thoughts."

Third: witchcraft and Sorcery among the Greeks

Despite Greece being the cradle of philosophy and science, this did not prevent the Greeks from practicing some magical rituals, as he said. Zilber notes that the philosopher Empedophilus believed in his ability to practice magic, claiming that he had the ability to heal old age and illness, provoke storms, bring down rain, and summon the oracle in the afterlife.[1]

Fourth: witchcraft and Sorcery among the Romans

Ancient Roman medicine was a mixture of religious traditions and magic, using the practice of seeking healing from the gods and sacred dogs to ward off illness. Mythology has always supported magic among the Romans, who believed that the spirits of heroes hovered immortally to ward off evil spirits. Following these superstitions, they turned to the worship of natural elements, animals, etc.[2]

The second section : witchcraft and Sorcery in the Modern era.

Despite the advancement of science in the modern era, the practice of magic has not diminished. Rather, its forms and manifestations have multiplied, and the sorcerer has become a means of obstructing guidance and plundering people's wealth unjustly. Once limited to a specific group of people, magic has become popular in the current era, as social media has contributed to this and has spread to include sensitive topics affecting human life, such as separating spouses and spreading illness and psychological delusions. Magicians have become willing to do anything for money. [3]

Social media and judicial channels are the most widespread avenues for the spread of this phenomenon, such as programs related to the study of horoscopes (astrology), gemology, and channels specializing in fortune-telling, magic, and sorcery, which carry subliminal messages such as "servant" and "follower" for the sake of comedy and entertainment. These channels also include those who have misrepresented the image of legitimate ruqyah and used their magic in a religious manner, far removed from the authentic Islamic ruqyah.[4]

You don't have to be interested in these actions and practices to fall victim. Games specifically for children have become widespread, closely linked to these games, such as the Maryam game and the Blue Whale game. Random calls are also made by those who practice these professions to influence people and infect victims who believe they have the disease and magic, and that they possess the cure for it. Clips have been posted on social media by those claiming to have knowledge of others, such as Laila Abdel Latif and others, and horoscope news has been disseminated through newspapers, daily magazines, and social media.

The second topic: The Legal Framework for the Crime of witchcraft and Sorcery

The Algerian legislator intervened to fill the legislative gap by addressing the phenomenon of magic and sorcery, aiming to limit the spread of this vile act. Like other crimes, the crime of magic and sorcery was given a criminal framework that encompasses the various elements of this crime (Section One). It also defined a penal framework, represented by the prescribed punishment for this crime (Section Two).

First requirement: Elements of the Crime of witchcraft and Sorcery

The crime of magic and sorcery is established by the presence of three elements: a legal element (Section One), criminal behavior or the material element (Section Two).

The First Section : Legal Element

[1] Omar Suleiman, "The World of Magic and Sorcery," Dar al-Naqais, 3rd ed., Jordan, 1997, p. 37.
[2] Is'ad Faiza Zerhouni, op. cit., p. 661.
[3] Yudan Kawthar, Jahar Samia, "The Crime of Magic and Sorcery in Electronic Newspapers: The Jararis Website as a Model," Journal of Studies in Development and Society, Volume 4, Algeria, 2021, pp. 103-104.
[4] Muhammad bin Ibrahim Al-Hamad, Magic Between Past and Present, Qassim University, College of Sharia and Fundamentals of Religion, Department of Aqeedah, Saudi Arabia, 2008, p. 77.

The Algerian legislator attempted to combat the crime of magic and sorcery by relying on Article 456 of the Penal Code, which criminalizes the profession of fortune-telling, predicting the future, and interpreting dreams. However, this article was characterized by shortcomings due to its deficiencies and flaws, which prevented it from effectively combating the phenomenon of magic and sorcery. This prompted the legislator to introduce significant amendments to the Penal Code.[1]

Hence, Algerian legislation did not include an explicit text criminalizing these behaviors until the 2024 amendment to the Penal Code, with explicit texts in Articles 303 bis 42 and 303 bis 43. These two articles were included in Section Six of Chapter One of Part Two of Book Three of the Penal Code, entitled "Acts of Magic and Sorcery."

The Second Section: The Material Element

The material element generally consists of criminal behavior and the realization of a criminal result, along with a causal relationship. The material element of the crime of witchcraft and sorcery is represented by the following:

First: The criminal behavior of the crime of witchcraft and sorcery

The criminalization of witchcraft and sorcery includes practicing witchcraft and sorcery, or performing any of its acts for a material or moral reward. The Algerian legislator has defined, under Article 303 bis 42, the means or actions used in practicing witchcraft and sorcery, as follows:

1- Creating hope:

This involves creating in the victim the idea that a positive event will occur in the future. For example, if the person proposing to the witch is a girl who desires marriage, the witch will delude her into believing that he has the ability to facilitate the marriage, or to convince a merchant that he has won a deal, or a woman that she will give birth, or that she will be cured of a specific illness.

2- Fear of another imaginary incident or event:

This occurs by instilling fear in the person that something will happen, such as by making an employee with a job problem believe they will be laid off and that they have the power to prevent it, or by making a woman believe she will divorce and that they have the power to reconcile her with her husband.

The sorcerer or charlatan does this by making people believe they have imaginary powers, such as spiritual authority and supernatural powers that enable them to communicate with jinn to fulfill their requests, or by assuming false attributes. The perpetrator claims to be a saint of the righteous, to possess miracles, or to be of noble lineage.[2]

3- Violating the privacy of individuals, their honor, and dignity, and defrauding and defrauding them.

In many cases, practitioners of sorcery and witchcraft resort to requesting information, photos, or personal items from the person they are going to practice these acts on.

Here, we point to the ongoing controversy surrounding the practice of ruqyah, which has become a widespread phenomenon in Algerian society, with some ruqyah practitioners resorting to opening clinics. In many cases, the practice of ruqyah has led to dire consequences, including the violation of people's honor and the creation of enmity between individuals under the guise of legitimate ruqyah. Its practitioners resort to using methods that cause physical or psychological harm, and in some cases, even death. Thus, the dividing line between ruqyah and sorcery becomes very close. However, Article 342, although it does not explicitly refer to ruqyah, stipulates that

[1] Somati Sharifah, The Crime of Magic and Sorcery in the Amendment to the Algerian Penal Code No. 24-06, Journal of Human Rights and Public Liberties, Abdelhamid Ibn Badis University-Mostaganem, Volume 9, Issue 2, Algeria, p. 622.
[2] Bouhentala Yassin, Dhibih Hisham, op. cit., p. 782.

ruqyah performed by genuine ruqyah practitioners is legally and socially acceptable[1]. It criminalizes any act based on fraud and deception in the name of ruqyah, particularly if it involves an infringement on the privacy or dignity of individuals, as indicated in the third paragraph of Article 303 bis 42 of the Algerian Penal Code.[2]

Second: The Criminal Result

Referring to the first paragraph of Article 303 bis 42 above, we note that the Algerian legislator did not require the occurrence of a criminal result, but rather considered the result an aggravating circumstance for the penalty.

The third Section: The Moral Element

The crime of witchcraft and sorcery is considered a crime in which the moral element takes the form of criminal intent, represented by the perpetrator's knowledge of the elements of the crime and his intention to commit it. This is achieved in the crime of witchcraft and sorcery through the perpetrator's knowledge of the acts considered to be witchcraft and sorcery and his intention to commit them by deceiving people with his ability to fulfill their demands or avoid a problem, or by defrauding them.[3]

Second Requirement: Penal Treatment for the Crime of witchcraft and Sorcery

Under Article 456 of the Penal Code, before its repeal, the legislature criminalized the practice of magic and sorcery under the various names of "fortune-telling, divination, and dream interpretation," criminalizing violations of which were punishable by imprisonment for a maximum of five days and a fine of 1,000 to 300 DZD, as well as the seizure and confiscation of the devices, tools, and clothing used or prepared for such practice. Regarding the penalty prescribed for the crime of magic and sorcery, the provisions of Article 303 bis 42 distinguish between three cases:

The First Section : The first case

Penalty for anyone who practices magic and sorcery as a profession or practices any of its activities for the purpose of obtaining a material or moral benefit. The penalty is imprisonment for a period of one to three years and a fine of 100,000 to 300,000 DZD.

The Second Section : The second case

Represents the case where magic acts result in Sorcery is physical or moral harm unless the act constitutes a more serious crime, the penalty for which is imprisonment from three to seven years and a fine of 300,000 to 700,000 DZD.

The third Section : The third case

In which the criminal act results in violation of the privacy, honor, and dignity of individuals, or fraud and deception, the penalty is imprisonment from five to ten years and a fine of 500,000 to 1.000.000 DZD

Conclusion:

[1] Bouhentala Yassin, Dhibih Hisham, op. cit., p. 782.
[2] Article 303 bis 42 of the Algerian Penal Code, op. cit.
[3] Ibid., p. 782.

From what has been studied in this research paper, it is clear that criminalizing magic and sorcery represents an important step that reflects the wisdom of the Algerian legislator and his commitment to keeping pace with the demands of social life, phenomena that undermine public order, and the religious and spiritual values of individuals. Magic has become a means of harming societal security, exploiting individuals' physical and psychological weaknesses and religious restraints, and even threatening family stability. **Through what has been analyzed in this study, we have reached the following important conclusions:**

1- The new amendment to the Algerian Penal Code demonstrates the awareness and wisdom of the legislator, reflecting his commitment to keeping pace with the demands of social life, phenomena that undermine public order, and the religious and spiritual values of individuals.

2- Practical reality has demonstrated the widespread prevalence of magic and sorcery practices, the development of their methods, and the contribution of technology to their dissemination and promotion.

3- The absence of methods and mechanisms of proof that facilitate the detection of these crimes.

Based on the overall results recorded in this study, we propose the following key recommendations:

4- The need to activate law enforcement officers to conduct inspections to detect and prove the commission of these crimes.

5- Strengthening the role of the media in refuting myths and exposing the practices of witchcraft and sorcery.

6- Boycotting channels and pages that promote such practices.

7- Establishing a hotline to report crimes of witchcraft and sorcery.

8- Establishing centers that provide psychological and social support to people suffering from problems that may lead them to resort to witchcraft and sorcery.

Findings

1. Legal Modernization: Law No. 24-06 fills a long-standing legislative gap in Algerian criminal law by providing explicit penal provisions against witchcraft and sorcery, previously treated under general fraud articles.
2. Judicial Clarity: The inclusion of Articles 303 bis 42 and 303 bis 43 offers clearer judicial guidance and strengthens the capacity of the judiciary to combat fraudulent magical practices that exploit emotional and psychological vulnerabilities.
3. Cultural and Spiritual Impact: The law recognizes the socio-cultural dimensions of witchcraft as not merely spiritual or religious deviations, but as acts of psychological and economic harm to society.
4. Implementation Challenges: Despite legislative clarity, challenges remain in evidence collection, differentiation between superstition and criminal deception, and the balance between freedom of belief and protection against manipulation.

Novelty of the Study

This research is among the first comprehensive academic analyses of Law No. 24-06, situating the criminalization of witchcraft and sorcery within a broader socio-legal and anthropological context. Unlike earlier studies that addressed witchcraft merely as a moral or cultural issue, this study demonstrates how Algeria has transitioned from moral condemnation to legal accountability, reflecting a progressive harmonization between traditional cultural values and modern legal principles.

Furthermore, the paper contributes to the emerging field of comparative criminal law of spiritual practices, offering an interpretive model that other MENA countries could adopt when framing similar legislation.

Methodology

The study employs a qualitative legal-analytical approach combining three complementary dimensions:
1. Doctrinal Legal Analysis – examining the textual and structural elements of Articles 303 bis 42 and 303 bis 43 in light of prior legislative frameworks and judicial interpretations.
2. Comparative Legal Review – evaluating Algeria's legislative approach in contrast with other Arab and African jurisdictions that criminalize witchcraft under customary or penal laws.
3. Descriptive-Analytical Approach – utilizing historical, linguistic, and jurisprudential sources (including classical Arabic dictionaries and Islamic juristic thought) to establish a conceptual foundation for the crime of witchcraft and its manifestations.

This mixed approach ensures a comprehensive understanding of both the legal and sociocultural dimensions of the topic, offering analytical depth beyond mere statutory interpretation.

Ethical Considerations

This study adheres to ethical standards of academic integrity and legal scholarship. All legal texts and references were cited accurately, and interpretive analyses were conducted with respect for religious and cultural sensitivities. The research does not advocate or endorse any supernatural belief system but seeks to evaluate the legal and societal impact of criminalizing related acts.

No personal or confidential data were collected, and all secondary sources were used under fair academic use.

Acknowledgments

The author extends sincere appreciation to the Laboratory of Environmental Legal Studies at the University of Guelma for providing access to legislative databases and academic resources. Gratitude is also expressed to colleagues in the Faculty of Law and Political Science for their constructive feedback and engagement during seminars on criminal law reform.

Funding Statement

This research received no external funding. It was conducted as part of the author's independent scholarly activities within the University of Guelma's legal research program.

Conflict of Interest

The author declares no conflict of interest related to this publication.

Keywords Emir Abdelkader; French colonial historiography; Western historians; realism and bias; colonial discourse; Orientalism; resistance narrative; Franco-Algerian relations

Abstract
This study explores the multifaceted representation of Emir Abdelkader in Western European historiography, focusing particularly on French and British narratives between the nineteenth and early twentieth centuries. The paper revisits how European historians, biographers, and travelers constructed the image of the Algerian resistance leader—oscillating between admiration for his chivalric ethics and distortion through colonial ideology. Through comparative historical and textual analysis, the study reveals the interplay of realism, bias, and ideological framing in the portrayal of Emir Abdelkader's personal virtues, political strategies, and intellectual legacy. Primary attention is devoted to authors such as Henry Churchill, Alexandre Bellemare, Léon Roches, Bruno Étienne, and Denzin, whose works constitute the foundational corpus of Western interpretations of the Emir's life and resistance. The analysis highlights how the Emir's image evolved from a rebellious "enemy" into a "noble ally" following his exile to France, thus reflecting the shifting political needs of colonial discourse. The study concludes that Western historical writings, while preserving valuable documentary material, often reflect a dual narrative—one recognizing Abdelkader's universal humanitarianism, and another constrained by the limits of imperial ideology.

Introduction:

Emir Abdelkader is one of the prominent historical figures of Algeria who has received considerable attention from researchers and historians. Many French historians and writers have written extensively about his personality and his struggle, given that the Emir is regarded as a global figure. His resistance resonated not only in Europe but

also in the Arab world, and his character and achievements added to his international stature. Western writings addressed various aspects of his life, personality, resistance, and even the state he established in Algeria—a state that France itself recognized and which was respected by Western nations.

From this perspective, the following problem arises: How did French and Western writings portray Emir Abdelkader in terms of his personality and his resistance against French colonialism? To what extent were these writings objective in their treatment of his personality and his struggle?

In conducting this study, we adopted the historical method, which traces historical events, in addition to the descriptive-analytical approach, applied in the scientific examination of selected events and incidents relevant to the subject. We also employed a comparative approach, as it provides further clarification and enriches the analysis.

1- Western Historical Studies on the Personality of Emir Abdelkader

Much has been written about the personality of the Emir, among them Henry Churchill, who mentioned that Emir Abdelkader was born on Friday, the 23rd of Rajab 1222 AH / 1807 AD (Henry, 1991, p. 39).

Both the French writers Alexandre Bellemare and Léon Roches agreed that the birth of Abdelkader ibn Muhieddine was on Tuesday, the 15th of Rajab 1223 AH, corresponding to September 6, 1808 (Léon Roches, 1884: 140). Meanwhile, Bruno Étienne stated that the Emir was born in 1807 or 1808 in the plain of Mascara, in the Oran region (Etienne, 1997, p. 15).

Regarding his upbringing, Henry Churchill noted that Emir Abdelkader grew up under the care of his father, who devoted to him unusual attention as a child whose future was destined to be surrounded by glory and tied to the destiny of his country. His intellectual abilities revealed an exceptional brilliance, as he was able to read and write at the age of five, and by the age of twelve he had mastered the Qur'an, Hadith, and the principles of Sharia, after which he became a student (Churchill, 1974, p. 39).

The Emir was his father's favorite and closest son, as he practiced religious rituals with him—a fact mentioned by Alexandre Bellemare (Bellemare, 1863, p. 12). Étienne also noted that the Emir spent most of his time with horses (Etienne, 1997, p. 44).

Churchill further reported that at the age of seventeen, the Emir became renowned among his peers for his remarkable strength and evident vitality. He also began giving lessons in the family mosque, explaining and interpreting the most complex and profound verses and texts. His greatest ambition in youth was to become a marabout, like his father whom he deeply admired (Churchill, 1974, pp. 39-40).

Churchill also stated that no one could equal him in horsemanship; he was not only an imposing rider but also demonstrated astonishing superiority in all the skills required of horsemanship—keen eyesight, steady hand, and true manliness—earning the admiration of all who knew him. He took pleasure in all forms of entertainment demanding skill and courage, and took pride in mastering falconry, as well as hunting gazelles, ostriches, and wild boars (Churchill, 1974, pp. 40-41).

2- Western Writings and Historical Studies on the Resistance of Emir Abdelkader

Many writings have addressed the resistance of Emir Abdelkader, from 1832 until his surrender in 1847. Denzin noted that the French occupation of the city of Oran was, for the Arabs, an invitation to free themselves from Turkish rule in the entire province. The city of Mascara, located inland, rose up against the Turks who believed their presence there was sustainable. Some of them were killed, others expelled, and the city turned into a republic. During these circumstances, the Emir's father was an elderly sheikh who, in 1832, was elected leader of the Arab tribes inhabiting the Mascara region. However, due to his old age, the sheikh declined this position and entrusted it to his son Abdelkader (Denzin, 2003, p. 22).

As for the first pledge of allegiance, known as the "private pledge," Paul Azan mentioned that Emir Abdelkader was no more than twenty-four years old at the time (Azan, 2003, p. 15). Léon Roches noted that Abdelkader's first

appearance was in May 1832 under the walls of Oran, where he displayed great courage by infiltrating the French army and assisting the wounded. From this incident, he earned a special status among them, and they regarded him as Emir, Sultan of the Arabs, and their commander in the field (Roches, 1884, p. 35). Bruno Étienne, however, stated that Abdelkader entered the plain of Macta and dictated to his scribe the text of the pledge, which was later read before all tribes and in the squares of towns and villages (Etienne, 1997, p. 152).

As for the second pledge of allegiance, known as the "public pledge," Churchill noted that the Emir realized that love of country and zeal for religion were the only tools with which he could unify all tribes. He therefore called for a general assembly in the city of Mascara in the spring of 1833, a call that was welcomed by a large number of major tribes from both the Tell and the Sahara (Churchill, 1974, p. 62).

The public pledge marked the beginning of the legitimate rule of Emir Abdelkader, who confronted colonialism in numerous battles. He also concluded two treaties: the Treaty of Tafna and the Treaty of Desmichels. The latter, signed between General Desmichels and Emir Abdelkader, drew significant attention from Western writers. Churchill noted that General Desmichels signed this treaty after realizing from bitter experience that he could not occupy the Oran region with the limited forces his government had placed at his disposal (Churchill, 1974, p. 84).

The Emir wrote:

"If you wish to maintain the prominent position that circumstances have placed you in, I see no better course than to accept my invitation, so that the tribes may devote themselves to cultivating the land and enjoy the fruits and blessings of peace under a treaty that binds us firmly together."

The letter was carried by the Jew Mordechai, who acted as intermediary between Emir Abdelkader and General Desmichels. He was the bearer of peace messages and was among those present at the signing of the treaty between the two parties. He is credited with playing a major role in securing for the Emir the significant privileges obtained through the treaty (Al-Jazairi, 1903, p. 114)

Johann Carl Bernet noted that the Emir understood the importance of concluding a treaty with the French, as it would consolidate his authority domestically on a firm foundation and enhance his strength to resist an enemy such as the French. This realization drove him to conclude the treaty (Bernet, 2009, p. 75)

According to Emir Abdelkader's own letter, the meeting between his representatives and the representative of French authority (see note 1) took place outside Oran with Mordechai Amar. He wrote: "I am sending to you two envoys, namely the Minister of Foreign Affairs, al-Mawlud ibn 'Arash, and Agha Khalifa ibn Mahmoud, who will meet outside Oran with Mordechai Amar. They will inform him of all the proposals. If you accept them, you may then send word to me, and we shall draft a treaty that will put an end to the hatred and hostility now dividing us, and replace them with friendship. You may rely on me, for I have never gone back on my word." (Churchill, 1974, pp. 76-77).

Among the conditions of the treaty, as recorded by Alexandre Bellemare, were the following:

The conditions of General Desmichels:

- The release of French prisoners.
- Any Christian traveling within the country must be provided with a passport stamped with both the seal of Emir Abdelkader's consul and that of General Desmichels.

The conditions of Emir Abdelkader:

- Arabs are free to buy and sell gunpowder, weapons, sulfur, and all items necessary for war.
- Trade in the port of Arzew shall be under the authority of the Commander of the Faithful, while Mostaganem and Oran shall only receive the commercial goods necessary to meet the needs of their inhabitants. This objective shall not be opposed, and those wishing to ship goods must go through the port of Arzew (Bellemare, 1863, p. 74).

- The general shall return all fugitives to us and pledge not to grant asylum to criminals. Moreover, the commander-in-chief in the city of Algiers shall exercise no authority over Arabs who may come to him with the consent of their chiefs.
- No Muslim shall be prevented from returning to his home whenever he (Bellemare, 1863, p. 73).

As for the Treaty of Tafna, Churchill noted that General Bugeaud arrived in Oran from France with specific instructions: either to make peace with Emir Abdelkader or to defeat him. He sent the Emir proposals based on mutual understanding, which included:

- Recognition of French sovereignty.
- Limitation of Abdelkader's influence to the Chlef River.
- Payment of tribute to France.
- Delivery of hostages as a pledge for the implementation of any future treaty that might be agreed upon (Churchill, 1974, pp. 86-110).

These were conditions rejected by the Emir, who instead proposed the following:

- The Emir would recognize the sovereignty of France.
- France would retain, in the province of Oran, a strip extending ten to twelve leagues in width, beginning at Rio Salado and ending at the Chlef River. In the province of Algiers, it would retain the city of Algiers and the entire territory bearing that name, while leaving to the Emir the province of Titteri and the province of Oran, except for the mentioned strip.
- The Emir would pay an annual tribute in the form of wheat and livestock.
- Complete freedom of trade.
- All entitlements already obtained by the French, or that they may obtain in the country, would be guaranteed to them (Churchill, 1974, pp. 111-112).

The Emir's conditions, however, were rejected by Bugeaud, who occupied Tafna in order to force the Emir to accept an agreement. The treaty was concluded only after the Emir made concessions:

- Abandonment of Blida.
- Renunciation of any claim to authority over Muslims residing in the French-controlled zone.
- Some extension of French (Churchill, 1974, p. 117).

Thus, the treaty known as the "Treaty of Tafna" was drafted and signed by both parties on May 20, 1837.

Emir Abdelkader fought many battles, which were recorded in French writings, such as the Battle of the Macta (1835). Alexandre Bellemare wrote that this battle was among the most important victories of Emir Abdelkader over the French army led by General Trézel on June 18, 1835. France admitted its defeat, having lost more than 280 dead, 500 wounded, and 17 prisoners (Bellemare Alexandre, 1863: 113). Paul Azan noted that French public opinion was shaken by the outcome of the battle and demanded a campaign against Mascara and its leader Abdelkader. General Trézel was replaced by General Clauzel (Azan, 2003, p. 16). Churchill, for his part, recounted the reaction of M. Thiers during the 1835 session of the French Parliament, when he commented on the system then applied in Algeria, saying: "It is neither peace, nor war, but a badly managed war." (Charles Henry Churchill, 1974) (Churchill, 1974).

As for **state-building and administrative organization** in Algeria, numerous writings have addressed this subject. Alexandre Bellemare reported that Emir Abdelkader divided his state into eight provinces, each under the command of a khalifa (deputy) appointed by him:

- The province of Tlemcen, under the leadership of Khalifa al-Bouhamidi.
- The province of Mascara, under the leadership of his son-in-law, al-Mustafa ibn al-Tuhami.

- The province of Miliana, under the leadership of Khalifa Sidi Mohammed al-Saghir, and after his death, Mohammed ibn Allal, son of Sidi Mubarak.
- The province of Titteri, under the leadership of Khalifa Mohammed al-Barkati.
- The province of Bordj Hamza, under the leadership of Ahmed ibn Salem.
- The province of Mjāta, under the leadership of Sidi Toubal Abdel-Salam.
- The province of Ziban, under the leadership of Sidi al-Hajj al-Saghir.
- The province of Western Sahara, under the leadership of Khalifa Qaddour ibn Abdel-Baqi.

Each khalifa's province was subdivided into several sections headed by an agha, and each agha oversaw several tribes, themselves under the command of a qa'id (commander) acting under the authority of the tribal sheikh (Bellemare, 1863, p. 220).

Charles Henry Churchill also mentioned that Emir Abdelkader divided the province of Oran into two large regions, each placed under the authority of a khalifa. The eastern region was further divided into seven districts, each led by an agha, with his son-in-law, Mustafa ibn al-Tuhami, serving as his khalifa there. Mascara was the seat of government in this region. The western region, with Tlemcen as its capital, was under the authority of Khalifa al-Bouhamidi (Churchill, 1974, p. 140).

Regarding military organization, Churchill noted that Abdelkader's irregular forces during the early period of his struggle amounted to about 6,000 soldiers. This count included all the units provided by the tribes in times of emergency, although it was rare for even a third of this number to gather at once for a campaign. As for the irregular cavalry, who were the most effective, their numbers were limited (Churchill, 1974, p. 140).

Meanwhile, Alexandre Bellemare reported Emir Abdelkader's own description of his army:

"In addition to the forces sent by the tribes under my authority and the troops of my khalifas, which form a massive auxiliary force, I could not retain soldiers far from their tribes for long. I had, however, a regular army consisting of 8,000 infantrymen, 2,000 cavalrymen, 240 artillerymen, and I possessed 20 field cannons, in addition to a large number of iron and bronze cannons, most of them out of service, left behind by the Turks" (Bellemare, 1863, pp. 225-226).

3- Western writings on the life of the Emir after the end of the resistance (1847–1883):

Western sources did not overlook the historical phases of Emir Abdelkader's life between 1847 and his death in 1883, following the end of his resistance. They referred to his imprisonment in France for five years between Toulon and Amboise, his later move to the Mashriq, and his prominent role in quelling the Damascus disturbances of 1860. They also described the final years of his life, during which he suffered from numerous illnesses that weakened him and eventually led to his death in Damascus in 1883.

3.1 The End of Emir Abdelkader's Resistance:

Western writings, particularly French ones, did not overlook the news of Emir Abdelkader's surrender. It was a matter that even the French newspapers reported on, as the news of his capitulation spread throughout France with great enthusiasm. Le Moniteur in its issue of January 3, 1848, highlighted this good news, stating: "The submission of Abdelkader is an event of great importance for France. It confirms the security of our occupation, and it allows us to reduce the number of men and funds we had been sending to Africa for so many years" (Churchill, 1974, p. 250).

3.2 The Emir in Prison:

The Emir was deported to France to serve his imprisonment instead of being transferred to the East as he had agreed with Lamoricière (see Comment No. 2). He disembarked at the naval port of Toulon on January 8, 1848, instead of arriving in Damascus. Bruno Étienne noted that Emir Abdelkader could not understand why the king's son had broken his promise. He wished to travel to Alexandria, but the monarchy was faltering, and parties and

factions were divided over his fate. Abdelkader was left bewildered and surprised by the proposals conveyed to him by General Dumas, who rushed from Paris, sent by François Guizot—himself a man influenced by colonialist circles—telling the Emir that he must forget the promises previously made to him (Etienne, 1997, p. 250).

The Emir wrote many letters and signed numerous documents guaranteeing that he would neither return to Algeria nor resume resistance against colonial rule. Charles Churchill reported that Abdelkader believed these documents, formally requested of him, would soon prove to be a prelude to his release. Every dawn he awaited as if it were the herald of freedom. At last, the long-expected reply arrived. He opened it eagerly, only to find it declared: "The Republic does not consider itself bound by any commitment to Abdelkader and regards him, as the previous government did, as a prisoner." This biting mockery struck the Emir to the core, and he sank into the depths of despair and despondency (Churchill, 1974, p. 250).

Boualem Bessaih noted that the government's choice of Fort Lamalgue in Toulon as Emir Abdelkader's place of detention was neither sudden nor coincidental. Rather, it was a military port that offered the necessary foreign guarantees, given the military units stationed there, as well as its strategic location near the sea, which made it difficult for the Emir to escape and return to Algeria (Bessaih, 1997, p. 194).

Meanwhile, Fabvier mentioned that France's interests and its honor converged in the ratification of the promise, which had become necessary, since the interests of France could not be separated from its honor (Guizot, n.d, pp. 525-530).

3.3 The Emir in Exile:

After his release, Emir Abdelkader traveled to Alexandria, and from there to Istanbul, the capital of the Islamic Caliphate. He arrived on 22 Rabīʿ al-Awwal 1269 AH / January 7, 1853 CE. From there, he moved to Bursa, where he stayed for three years before leaving in 1272/1273 AH (1856 CE), and then headed to Beirut, followed by Damascus, where he remained until his death.

Henry Churchill wrote that Emir Abdelkader was the center of attention for scholars and intellectuals, as he was a sharif descending from the Prophet ﷺ, a learned scholar, and a leader of jihad. They felt connected to him not only by sentiments of national solidarity but also by religious duty (Churchill, 1974, p. 278). Bruno Étienne also mentioned that the Emir was a member of the Damascus city council, where he mingled with the region's intellectual elite who visited him. He was also connected with prominent families such as the Al-Azm family, and together with these families, he contributed both to the technological development of the region—for example, by financing the Damascus–Beirut road—and to the major debates that shook the Ottoman Empire on its path to decline, beginning with the Hatt-ı Hümayun decree of 1856 up until the Arab Revolt (Etienne, 1997, p. 15).

Among the notable events Emir Abdelkader experienced in Damascus was the conflict between the Druze and the Christians. Henry Charles recounts: "In July 1860, the fame of Emir Abdelkader and his humanity spread throughout the world, as he worked to stop the fighting between the Druze and the Christians in Damascus. At the same time, the Emir helped Algerians living in Syria, moving between Christian quarters to halt the strife, during which nearly 15,000 Christians were saved from death" (Henry, 1991, pp. 303-316).

He also mentioned how letters, gifts, and decorations poured upon the Emir from all sides: France sent him the Grand Cordon of the Légion d'honneur; Prussia awarded him the Grand Cross of the Black Eagle; Greece offered him the Grand Cross of the Saviour; Turkey bestowed upon him the First Class of the Order of the Medjidie; while England presented him with a beautifully gold-embellished double-barreled rifle, and the United States sent him two rifles also inlaid with gold. All of these decorations and gifts were accompanied by letters of gratitude (Henry, 1991, pp. 287-288).

4. The Death of Emir Abdelkader in French Western Writings

Among those who wrote about the death of Emir Abdelkader was Paul Azan, who in his book Great Military Leaders stated that the Emir died on May 26, 1883 (Azan, 2003, p. 53).

The French regarded Emir Abdelkader as a popular hero, whose portraits appeared in the collections of Énals commemorating the heroes whom France was proud of. They admired him for his nobility, especially after they had defeated him militarily and unsuccessfully tried to push him into imperial projects, which he refused without ever breaking the oath of loyalty he had sworn to them (Etienne, 1997, p. 15).

Among the Emir's works that were translated into French was his book Kitab al-Mawaqif (The Book of Spiritual Standings), translated by Michel Chodkiewicz. In his study, Chodkiewicz viewed Emir Abdelkader as the legitimate heir of the great Sufi master Ibn 'Arabi, and believed that the Emir's revival of his teachings was of great importance (Etienne, 1997, p. 16).

Some French Western writings, however, sought to distort the events of Emir Abdelkader's captivity in France, interpreting them in a way that turned this period into a dark page in his life, portraying him as an ally of France and a supporter of its policies. Part of this narrative included the claim about his participation, along with fourteen of his companions, in the French elections of November 21, 1852. This was reported by Paul Azan, Bruno Étienne, and Zoumoroff. French sources narrated that on November 20, Emir Abdelkader wrote a letter to the governor of the département of Loir-et-Cher requesting to take part in the elections. Indeed, on November 21, he and fourteen of his companions voted in favor of Napoleon Bonaparte, as an expression of the good relationship between him and Napoleon Bonaparte (Zoumoroff et al, 1994, p. 434).

Other sources, however, presented the matter differently, stating that the Emir merely wished Napoleon Bonaparte success in the elections and thanked him for his treatment of him. This wish was interpreted by some as a symbolic vote.

The facts reveal that the French sought to exploit the image of Emir Abdelkader to their own advantage, using it as a reference point to legitimize their colonial project and to tarnish his reputation and standing—particularly during the period of his imprisonment in France. In doing so, France relied on its historians to propagate baseless accusations and falsehoods about Emir Abdelkader in an effort to convince future generations, without any evidence.

As for the decorations and honors that Emir Abdelkader received after the Damascus massacre and his achievements in preventing bloodshed there, they were later used against him, being portrayed as attempts to win him over. France sought to exploit Emir Abdelkader in order to advance and expand its colonial project in the Levant. Reports from French consuls support this view, such as the statement of the French consul in Damascus, "Boulad," in one of his reports: "Perhaps the day will come when it will be very advantageous for France to have a man like Abdelkader in the heart of Syria, who, whether as an instrument or as an ally, could exert his weight in the balance of Ottoman authority" (Etienne, 1997, pp. 311-312).

Charles Robert Ageron further commented in this regard: "Abdelkader is the ruler of an Arab kingdom in the East—he is the ruler of Syria. This was a political idea that circulated as early as 1860, and he was nominated by most politicians and journalists as a figure symbolizing Arab nationalism. It was Napoleon Bonaparte's idea, allowing for the first time an Arab leader the possibility of ruling a kingdom" (Ageron, 1970, pp. 15-30).

On September 22, 1860, the Minister of War instructed the French general to offer Abdelkader the rule of Syria and to inform him of his influence over the representatives in Beirut and their desire for such a plan, claiming that this was solely for the benefit of Syria (Ageron, 1970, p. 58). All of this, however, aimed to portray Emir Abdelkader as France's ally in the Levant, reducing every action he undertook to a service to France.

Conclusion:

From this study, we conclude that the figure of Emir Abdelkader drew the attention of European historians. References to him can even be found in the memoirs of military leaders, commanders, and politicians who had direct contact or encounters with him. These writings addressed many aspects of his life—from his birth to his death. Some treated his life objectively, while others leaned toward interpretations distant from reality, built upon suppositions, distortions, and misrepresentations. These particularly sought to mislead during the period of Abdelkader's captivity in France, where the French government attempted to depict him as France's ally and

friend—ready to accept its colonization of Algeria—rather than the resolute adversary who had fought to expel it. All this fell within deliberate political strategies from which Abdelkader himself distanced and shielded himself. Yet despite this, such portrayals continue to appear today in some Western writings that deal with the figure of Emir Abdelkader, his jihad against French colonialism, and even his life in exile.

Comments:

1. The representatives of the Emir were the Minister of Foreign Affairs, Al-Mawloud bin Arrach, and Agha Khalifa bin Mahmoud.
2. Christophe Léon Louis Juchault de Lamoricière: Known for acts of extermination and war crimes against the populations of the Maghreb, he was appointed Minister of War in 1848.

Emir Abdelkader (1808–1883) remains one of Algeria's most emblematic figures of resistance against French colonialism and a symbol of Islamic humanism recognized worldwide. His struggle transcended military resistance, embodying political organization, moral leadership, and philosophical reflection. Western historiography, particularly French and British, has long been divided between admiration and ideological distortion in its portrayal of the Emir. This study critically analyzes how European writers depicted his life—from his birth and education to his resistance (1832–1847), captivity, and post-exile humanitarian activities.

The central questions guiding this research are:
1. How did French and Western historical writings construct the image of Emir Abdelkader's personality and resistance?
2. To what extent did these writings reflect objective historiographical principles or reproduce colonial narratives?

Methodology

The research adopts a qualitative historical-comparative method based on:
- Documentary Analysis: Review of primary Western sources (Churchill, Bellemare, Roches, Étienne, Denzin) and selected Algerian and Arab historical accounts.
- Descriptive-Analytical Approach: Systematic examination of textual representations of the Emir's life, resistance, and exile.
- Comparative Historiography: Evaluation of differences in perspective between French colonial historians and later post-colonial Western scholars.

The temporal framework covers the period from 1830 to 1930, encompassing the height of colonial expansion and the maturation of Orientalist scholarship.

Findings and Discussion

1. Multiplicity of Western Interpretations:
European writers diverged in their accounts of the Emir's birth and upbringing. Churchill (1974) and Bellemare (1863) emphasized his early intellectual brilliance and religious devotion, while Étienne (1997) framed his youth within a modern sociological context of leadership formation.

2. Portrayal of Resistance:
Denzin (2003) and earlier French sources present the Emir's leadership as both heroic and inevitable within the socio-political turmoil of the Ottoman decline. However, French colonial writings often reframed his jihad as a civilizing encounter rather than anti-colonial resistance.

3. Transformation in Image:
After his surrender and exile, French historiography re-narrated Abdelkader's role from "enemy" to "friend of France," serving colonial diplomacy. His humanitarian actions in Damascus later enabled his transformation into a universal figure admired by both Muslims and Europeans.

4. Realism versus Controversy:
While some Western accounts (notably Churchill and Étienne) maintained relative historical realism, others were shaped by imperial ideology, leading to contradictions and mythologized depictions.

Novelty and Scholarly Contribution

This paper contributes to post-colonial historiography by reassessing Western writings not merely as biased sources but as reflective texts revealing Europe's intellectual engagement with Algerian resistance. It identifies the transformation of Emir Abdelkader's symbolic capital—from a localized resistance leader to a trans-cultural moral icon—and argues that this evolution parallels Europe's shifting moral narrative about colonization.

Ethical Considerations

All sources utilized are publicly available historical documents and published scholarly works. The study maintains academic neutrality and respects cultural sensitivity in interpreting both Western and Algerian perspectives. No human or animal subjects were involved in this research.

Acknowledgment

The author extends sincere appreciation to the Faculty of Humanities at the University of Moulay Tahar – Saida for their support and access to archival materials, and to colleagues specializing in modern Algerian history for their insightful discussions during manuscript preparation.

Funding

This research received no specific grant from any public, commercial, or not-for-profit funding agency.

Conflict of Interest

The author declares no conflict of interest related to the publication of this article.

Keywords Emir Abdelkader; French colonial historiography; Western historians; realism and bias; colonial discourse; Orientalism; resistance narrative; Franco-Algerian relations

Abstract
This study explores the multifaceted representation of Emir Abdelkader in Western European historiography, focusing particularly on French and British narratives between the nineteenth and early twentieth centuries. The paper revisits how European historians, biographers, and travelers constructed the image of the Algerian resistance leader—oscillating between admiration for his chivalric ethics and distortion through colonial ideology. Through comparative historical and textual analysis, the study reveals the interplay of realism, bias, and ideological framing in the portrayal of Emir Abdelkader's personal virtues, political strategies, and intellectual legacy. Primary attention is devoted to authors such as Henry Churchill, Alexandre Bellemare, Léon Roches, Bruno Étienne, and Denzin, whose works constitute the foundational corpus of Western interpretations of the Emir's life and resistance. The analysis highlights how the Emir's image evolved from a rebellious "enemy" into a "noble ally" following his exile to France, thus reflecting the shifting political needs of colonial discourse. The study concludes that Western historical writings, while preserving valuable documentary material, often reflect a dual narrative—one recognizing Abdelkader's universal humanitarianism, and another constrained by the limits of imperial ideology.

Introduction:

Emir Abdelkader is one of the prominent historical figures of Algeria who has received considerable attention from researchers and historians. Many French historians and writers have written extensively about his personality and his struggle, given that the Emir is regarded as a global figure. His resistance resonated not only in Europe but

also in the Arab world, and his character and achievements added to his international stature. Western writings addressed various aspects of his life, personality, resistance, and even the state he established in Algeria—a state that France itself recognized and which was respected by Western nations.

From this perspective, the following problem arises: How did French and Western writings portray Emir Abdelkader in terms of his personality and his resistance against French colonialism? To what extent were these writings objective in their treatment of his personality and his struggle?

In conducting this study, we adopted the historical method, which traces historical events, in addition to the descriptive-analytical approach, applied in the scientific examination of selected events and incidents relevant to the subject. We also employed a comparative approach, as it provides further clarification and enriches the analysis.

1- Western Historical Studies on the Personality of Emir Abdelkader

Much has been written about the personality of the Emir, among them Henry Churchill, who mentioned that Emir Abdelkader was born on Friday, the 23rd of Rajab 1222 AH / 1807 AD (Henry, 1991, p. 39).

Both the French writers Alexandre Bellemare and Léon Roches agreed that the birth of Abdelkader ibn Muhieddine was on Tuesday, the 15th of Rajab 1223 AH, corresponding to September 6, 1808 (Léon Roches, 1884: 140). Meanwhile, Bruno Étienne stated that the Emir was born in 1807 or 1808 in the plain of Mascara, in the Oran region (Etienne, 1997, p. 15).

Regarding his upbringing, Henry Churchill noted that Emir Abdelkader grew up under the care of his father, who devoted to him unusual attention as a child whose future was destined to be surrounded by glory and tied to the destiny of his country. His intellectual abilities revealed an exceptional brilliance, as he was able to read and write at the age of five, and by the age of twelve he had mastered the Qur'an, Hadith, and the principles of Sharia, after which he became a student (Churchill, 1974, p. 39).

The Emir was his father's favorite and closest son, as he practiced religious rituals with him—a fact mentioned by Alexandre Bellemare (Bellemare, 1863, p. 12). Étienne also noted that the Emir spent most of his time with horses (Etienne, 1997, p. 44).

Churchill further reported that at the age of seventeen, the Emir became renowned among his peers for his remarkable strength and evident vitality. He also began giving lessons in the family mosque, explaining and interpreting the most complex and profound verses and texts. His greatest ambition in youth was to become a marabout, like his father whom he deeply admired (Churchill, 1974, pp. 39-40).

Churchill also stated that no one could equal him in horsemanship; he was not only an imposing rider but also demonstrated astonishing superiority in all the skills required of horsemanship—keen eyesight, steady hand, and true manliness—earning the admiration of all who knew him. He took pleasure in all forms of entertainment demanding skill and courage, and took pride in mastering falconry, as well as hunting gazelles, ostriches, and wild boars (Churchill, 1974, pp. 40-41).

2- Western Writings and Historical Studies on the Resistance of Emir Abdelkader

Many writings have addressed the resistance of Emir Abdelkader, from 1832 until his surrender in 1847. Denzin noted that the French occupation of the city of Oran was, for the Arabs, an invitation to free themselves from Turkish rule in the entire province. The city of Mascara, located inland, rose up against the Turks who believed their presence there was sustainable. Some of them were killed, others expelled, and the city turned into a republic. During these circumstances, the Emir's father was an elderly sheikh who, in 1832, was elected leader of the Arab tribes inhabiting the Mascara region. However, due to his old age, the sheikh declined this position and entrusted it to his son Abdelkader (Denzin, 2003, p. 22).

As for the first pledge of allegiance, known as the "private pledge," Paul Azan mentioned that Emir Abdelkader was no more than twenty-four years old at the time (Azan, 2003, p. 15). Léon Roches noted that Abdelkader's first

appearance was in May 1832 under the walls of Oran, where he displayed great courage by infiltrating the French army and assisting the wounded. From this incident, he earned a special status among them, and they regarded him as Emir, Sultan of the Arabs, and their commander in the field (Roches, 1884, p. 35). Bruno Étienne, however, stated that Abdelkader entered the plain of Macta and dictated to his scribe the text of the pledge, which was later read before all tribes and in the squares of towns and villages (Etienne, 1997, p. 152).

As for the second pledge of allegiance, known as the "public pledge," Churchill noted that the Emir realized that love of country and zeal for religion were the only tools with which he could unify all tribes. He therefore called for a general assembly in the city of Mascara in the spring of 1833, a call that was welcomed by a large number of major tribes from both the Tell and the Sahara (Churchill, 1974, p. 62).

The public pledge marked the beginning of the legitimate rule of Emir Abdelkader, who confronted colonialism in numerous battles. He also concluded two treaties: the Treaty of Tafna and the Treaty of Desmichels. The latter, signed between General Desmichels and Emir Abdelkader, drew significant attention from Western writers. Churchill noted that General Desmichels signed this treaty after realizing from bitter experience that he could not occupy the Oran region with the limited forces his government had placed at his disposal (Churchill, 1974, p. 84).

The Emir wrote:

"If you wish to maintain the prominent position that circumstances have placed you in, I see no better course than to accept my invitation, so that the tribes may devote themselves to cultivating the land and enjoy the fruits and blessings of peace under a treaty that binds us firmly together."

The letter was carried by the Jew Mordechai, who acted as intermediary between Emir Abdelkader and General Desmichels. He was the bearer of peace messages and was among those present at the signing of the treaty between the two parties. He is credited with playing a major role in securing for the Emir the significant privileges obtained through the treaty (Al-Jazairi, 1903, p. 114)

Johann Carl Bernet noted that the Emir understood the importance of concluding a treaty with the French, as it would consolidate his authority domestically on a firm foundation and enhance his strength to resist an enemy such as the French. This realization drove him to conclude the treaty (Bernet, 2009, p. 75)

According to Emir Abdelkader's own letter, the meeting between his representatives and the representative of French authority (see note 1) took place outside Oran with Mordechai Amar. He wrote: "I am sending to you two envoys, namely the Minister of Foreign Affairs, al-Mawlud ibn 'Arash, and Agha Khalifa ibn Mahmoud, who will meet outside Oran with Mordechai Amar. They will inform him of all the proposals. If you accept them, you may then send word to me, and we shall draft a treaty that will put an end to the hatred and hostility now dividing us, and replace them with friendship. You may rely on me, for I have never gone back on my word." (Churchill, 1974, pp. 76-77).

Among the conditions of the treaty, as recorded by Alexandre Bellemare, were the following:

The conditions of General Desmichels:

- The release of French prisoners.
- Any Christian traveling within the country must be provided with a passport stamped with both the seal of Emir Abdelkader's consul and that of General Desmichels.

The conditions of Emir Abdelkader:

- Arabs are free to buy and sell gunpowder, weapons, sulfur, and all items necessary for war.
- Trade in the port of Arzew shall be under the authority of the Commander of the Faithful, while Mostaganem and Oran shall only receive the commercial goods necessary to meet the needs of their inhabitants. This objective shall not be opposed, and those wishing to ship goods must go through the port of Arzew (Bellemare, 1863, p. 74).

- The general shall return all fugitives to us and pledge not to grant asylum to criminals. Moreover, the commander-in-chief in the city of Algiers shall exercise no authority over Arabs who may come to him with the consent of their chiefs.
- No Muslim shall be prevented from returning to his home whenever he (Bellemare, 1863, p. 73).

As for the Treaty of Tafna, Churchill noted that General Bugeaud arrived in Oran from France with specific instructions: either to make peace with Emir Abdelkader or to defeat him. He sent the Emir proposals based on mutual understanding, which included:

- Recognition of French sovereignty.
- Limitation of Abdelkader's influence to the Chlef River.
- Payment of tribute to France.
- Delivery of hostages as a pledge for the implementation of any future treaty that might be agreed upon (Churchill, 1974, pp. 86-110).

These were conditions rejected by the Emir, who instead proposed the following:

- The Emir would recognize the sovereignty of France.
- France would retain, in the province of Oran, a strip extending ten to twelve leagues in width, beginning at Rio Salado and ending at the Chlef River. In the province of Algiers, it would retain the city of Algiers and the entire territory bearing that name, while leaving to the Emir the province of Titteri and the province of Oran, except for the mentioned strip.
- The Emir would pay an annual tribute in the form of wheat and livestock.
- Complete freedom of trade.
- All entitlements already obtained by the French, or that they may obtain in the country, would be guaranteed to them (Churchill, 1974, pp. 111-112).

The Emir's conditions, however, were rejected by Bugeaud, who occupied Tafna in order to force the Emir to accept an agreement. The treaty was concluded only after the Emir made concessions:

- Abandonment of Blida.
- Renunciation of any claim to authority over Muslims residing in the French-controlled zone.
- Some extension of French (Churchill, 1974, p. 117).

Thus, the treaty known as the "Treaty of Tafna" was drafted and signed by both parties on May 20, 1837.

Emir Abdelkader fought many battles, which were recorded in French writings, such as the Battle of the Macta (1835). Alexandre Bellemare wrote that this battle was among the most important victories of Emir Abdelkader over the French army led by General Trézel on June 18, 1835. France admitted its defeat, having lost more than 280 dead, 500 wounded, and 17 prisoners (Bellemare Alexandre, 1863: 113). Paul Azan noted that French public opinion was shaken by the outcome of the battle and demanded a campaign against Mascara and its leader Abdelkader. General Trézel was replaced by General Clauzel (Azan, 2003, p. 16). Churchill, for his part, recounted the reaction of M. Thiers during the 1835 session of the French Parliament, when he commented on the system then applied in Algeria, saying: "It is neither peace, nor war, but a badly managed war." (Charles Henry Churchill, 1974) (Churchill, 1974).

As for **state-building and administrative organization** in Algeria, numerous writings have addressed this subject. Alexandre Bellemare reported that Emir Abdelkader divided his state into eight provinces, each under the command of a khalifa (deputy) appointed by him:

- The province of Tlemcen, under the leadership of Khalifa al-Bouhamidi.
- The province of Mascara, under the leadership of his son-in-law, al-Mustafa ibn al-Tuhami.

- The province of Miliana, under the leadership of Khalifa Sidi Mohammed al-Saghir, and after his death, Mohammed ibn Allal, son of Sidi Mubarak.
- The province of Titteri, under the leadership of Khalifa Mohammed al-Barkati.
- The province of Bordj Hamza, under the leadership of Ahmed ibn Salem.
- The province of Mjāta, under the leadership of Sidi Toubal Abdel-Salam.
- The province of Ziban, under the leadership of Sidi al-Hajj al-Saghir.
- The province of Western Sahara, under the leadership of Khalifa Qaddour ibn Abdel-Baqi.

Each khalifa's province was subdivided into several sections headed by an agha, and each agha oversaw several tribes, themselves under the command of a qa'id (commander) acting under the authority of the tribal sheikh (Bellemare, 1863, p. 220).

Charles Henry Churchill also mentioned that Emir Abdelkader divided the province of Oran into two large regions, each placed under the authority of a khalifa. The eastern region was further divided into seven districts, each led by an agha, with his son-in-law, Mustafa ibn al-Tuhami, serving as his khalifa there. Mascara was the seat of government in this region. The western region, with Tlemcen as its capital, was under the authority of Khalifa al-Bouhamidi (Churchill, 1974, p. 140).

Regarding military organization, Churchill noted that Abdelkader's irregular forces during the early period of his struggle amounted to about 6,000 soldiers. This count included all the units provided by the tribes in times of emergency, although it was rare for even a third of this number to gather at once for a campaign. As for the irregular cavalry, who were the most effective, their numbers were limited (Churchill, 1974, p. 140).

Meanwhile, Alexandre Bellemare reported Emir Abdelkader's own description of his army:

"In addition to the forces sent by the tribes under my authority and the troops of my khalifas, which form a massive auxiliary force, I could not retain soldiers far from their tribes for long. I had, however, a regular army consisting of 8,000 infantrymen, 2,000 cavalrymen, 240 artillerymen, and I possessed 20 field cannons, in addition to a large number of iron and bronze cannons, most of them out of service, left behind by the Turks" (Bellemare, 1863, pp. 225-226).

3- Western writings on the life of the Emir after the end of the resistance (1847–1883):

Western sources did not overlook the historical phases of Emir Abdelkader's life between 1847 and his death in 1883, following the end of his resistance. They referred to his imprisonment in France for five years between Toulon and Amboise, his later move to the Mashriq, and his prominent role in quelling the Damascus disturbances of 1860. They also described the final years of his life, during which he suffered from numerous illnesses that weakened him and eventually led to his death in Damascus in 1883.

3.1 The End of Emir Abdelkader's Resistance:

Western writings, particularly French ones, did not overlook the news of Emir Abdelkader's surrender. It was a matter that even the French newspapers reported on, as the news of his capitulation spread throughout France with great enthusiasm. Le Moniteur in its issue of January 3, 1848, highlighted this good news, stating: "The submission of Abdelkader is an event of great importance for France. It confirms the security of our occupation, and it allows us to reduce the number of men and funds we had been sending to Africa for so many years" (Churchill, 1974, p. 250).

3.2 The Emir in Prison:

The Emir was deported to France to serve his imprisonment instead of being transferred to the East as he had agreed with Lamoricière (see Comment No. 2). He disembarked at the naval port of Toulon on January 8, 1848, instead of arriving in Damascus. Bruno Étienne noted that Emir Abdelkader could not understand why the king's son had broken his promise. He wished to travel to Alexandria, but the monarchy was faltering, and parties and

factions were divided over his fate. Abdelkader was left bewildered and surprised by the proposals conveyed to him by General Dumas, who rushed from Paris, sent by François Guizot—himself a man influenced by colonialist circles—telling the Emir that he must forget the promises previously made to him (Etienne, 1997, p. 250).

The Emir wrote many letters and signed numerous documents guaranteeing that he would neither return to Algeria nor resume resistance against colonial rule. Charles Churchill reported that Abdelkader believed these documents, formally requested of him, would soon prove to be a prelude to his release. Every dawn he awaited as if it were the herald of freedom. At last, the long-expected reply arrived. He opened it eagerly, only to find it declared: "The Republic does not consider itself bound by any commitment to Abdelkader and regards him, as the previous government did, as a prisoner." This biting mockery struck the Emir to the core, and he sank into the depths of despair and despondency (Churchill, 1974, p. 250).

Boualem Bessaih noted that the government's choice of Fort Lamalgue in Toulon as Emir Abdelkader's place of detention was neither sudden nor coincidental. Rather, it was a military port that offered the necessary foreign guarantees, given the military units stationed there, as well as its strategic location near the sea, which made it difficult for the Emir to escape and return to Algeria (Bessaih, 1997, p. 194).

Meanwhile, Fabvier mentioned that France's interests and its honor converged in the ratification of the promise, which had become necessary, since the interests of France could not be separated from its honor (Guizot, n.d, pp. 525-530).

3.3 The Emir in Exile:

After his release, Emir Abdelkader traveled to Alexandria, and from there to Istanbul, the capital of the Islamic Caliphate. He arrived on 22 Rabīʿ al-Awwal 1269 AH / January 7, 1853 CE. From there, he moved to Bursa, where he stayed for three years before leaving in 1272/1273 AH (1856 CE), and then headed to Beirut, followed by Damascus, where he remained until his death.

Henry Churchill wrote that Emir Abdelkader was the center of attention for scholars and intellectuals, as he was a sharif descending from the Prophet ﷺ, a learned scholar, and a leader of jihad. They felt connected to him not only by sentiments of national solidarity but also by religious duty (Churchill, 1974, p. 278). Bruno Étienne also mentioned that the Emir was a member of the Damascus city council, where he mingled with the region's intellectual elite who visited him. He was also connected with prominent families such as the Al-Azm family, and together with these families, he contributed both to the technological development of the region—for example, by financing the Damascus–Beirut road—and to the major debates that shook the Ottoman Empire on its path to decline, beginning with the Hatt-ı Hümayun decree of 1856 up until the Arab Revolt (Etienne, 1997, p. 15).

Among the notable events Emir Abdelkader experienced in Damascus was the conflict between the Druze and the Christians. Henry Charles recounts: "In July 1860, the fame of Emir Abdelkader and his humanity spread throughout the world, as he worked to stop the fighting between the Druze and the Christians in Damascus. At the same time, the Emir helped Algerians living in Syria, moving between Christian quarters to halt the strife, during which nearly 15,000 Christians were saved from death" (Henry, 1991, pp. 303-316).

He also mentioned how letters, gifts, and decorations poured upon the Emir from all sides: France sent him the Grand Cordon of the Légion d'honneur; Prussia awarded him the Grand Cross of the Black Eagle; Greece offered him the Grand Cross of the Saviour; Turkey bestowed upon him the First Class of the Order of the Medjidie; while England presented him with a beautifully gold-embellished double-barreled rifle, and the United States sent him two rifles also inlaid with gold. All of these decorations and gifts were accompanied by letters of gratitude (Henry, 1991, pp. 287-288).

4. The Death of Emir Abdelkader in French Western Writings

Among those who wrote about the death of Emir Abdelkader was Paul Azan, who in his book Great Military Leaders stated that the Emir died on May 26, 1883 (Azan, 2003, p. 53).

The French regarded Emir Abdelkader as a popular hero, whose portraits appeared in the collections of Énals commemorating the heroes whom France was proud of. They admired him for his nobility, especially after they had defeated him militarily and unsuccessfully tried to push him into imperial projects, which he refused without ever breaking the oath of loyalty he had sworn to them (Etienne, 1997, p. 15).

Among the Emir's works that were translated into French was his book Kitab al-Mawaqif (The Book of Spiritual Standings), translated by Michel Chodkiewicz. In his study, Chodkiewicz viewed Emir Abdelkader as the legitimate heir of the great Sufi master Ibn 'Arabi, and believed that the Emir's revival of his teachings was of great importance (Etienne, 1997, p. 16).

Some French Western writings, however, sought to distort the events of Emir Abdelkader's captivity in France, interpreting them in a way that turned this period into a dark page in his life, portraying him as an ally of France and a supporter of its policies. Part of this narrative included the claim about his participation, along with fourteen of his companions, in the French elections of November 21, 1852. This was reported by Paul Azan, Bruno Étienne, and Zoumoroff. French sources narrated that on November 20, Emir Abdelkader wrote a letter to the governor of the département of Loir-et-Cher requesting to take part in the elections. Indeed, on November 21, he and fourteen of his companions voted in favor of Napoleon Bonaparte, as an expression of the good relationship between him and Napoleon Bonaparte (Zoumoroff et al, 1994, p. 434).

Other sources, however, presented the matter differently, stating that the Emir merely wished Napoleon Bonaparte success in the elections and thanked him for his treatment of him. This wish was interpreted by some as a symbolic vote.

The facts reveal that the French sought to exploit the image of Emir Abdelkader to their own advantage, using it as a reference point to legitimize their colonial project and to tarnish his reputation and standing—particularly during the period of his imprisonment in France. In doing so, France relied on its historians to propagate baseless accusations and falsehoods about Emir Abdelkader in an effort to convince future generations, without any evidence.

As for the decorations and honors that Emir Abdelkader received after the Damascus massacre and his achievements in preventing bloodshed there, they were later used against him, being portrayed as attempts to win him over. France sought to exploit Emir Abdelkader in order to advance and expand its colonial project in the Levant. Reports from French consuls support this view, such as the statement of the French consul in Damascus, "Boulad," in one of his reports: "Perhaps the day will come when it will be very advantageous for France to have a man like Abdelkader in the heart of Syria, who, whether as an instrument or as an ally, could exert his weight in the balance of Ottoman authority" (Etienne, 1997, pp. 311-312).

Charles Robert Ageron further commented in this regard: "Abdelkader is the ruler of an Arab kingdom in the East—he is the ruler of Syria. This was a political idea that circulated as early as 1860, and he was nominated by most politicians and journalists as a figure symbolizing Arab nationalism. It was Napoleon Bonaparte's idea, allowing for the first time an Arab leader the possibility of ruling a kingdom" (Ageron, 1970, pp. 15-30).

On September 22, 1860, the Minister of War instructed the French general to offer Abdelkader the rule of Syria and to inform him of his influence over the representatives in Beirut and their desire for such a plan, claiming that this was solely for the benefit of Syria (Ageron, 1970, p. 58). All of this, however, aimed to portray Emir Abdelkader as France's ally in the Levant, reducing every action he undertook to a service to France.

Conclusion:

From this study, we conclude that the figure of Emir Abdelkader drew the attention of European historians. References to him can even be found in the memoirs of military leaders, commanders, and politicians who had direct contact or encounters with him. These writings addressed many aspects of his life—from his birth to his death. Some treated his life objectively, while others leaned toward interpretations distant from reality, built upon suppositions, distortions, and misrepresentations. These particularly sought to mislead during the period of Abdelkader's captivity in France, where the French government attempted to depict him as France's ally and

friend—ready to accept its colonization of Algeria—rather than the resolute adversary who had fought to expel it. All this fell within deliberate political strategies from which Abdelkader himself distanced and shielded himself. Yet despite this, such portrayals continue to appear today in some Western writings that deal with the figure of Emir Abdelkader, his jihad against French colonialism, and even his life in exile.

Comments:

1. The representatives of the Emir were the Minister of Foreign Affairs, Al-Mawloud bin Arrach, and Agha Khalifa bin Mahmoud.
2. Christophe Léon Louis Juchault de Lamoricière: Known for acts of extermination and war crimes against the populations of the Maghreb, he was appointed Minister of War in 1848.

Emir Abdelkader (1808–1883) remains one of Algeria's most emblematic figures of resistance against French colonialism and a symbol of Islamic humanism recognized worldwide. His struggle transcended military resistance, embodying political organization, moral leadership, and philosophical reflection. Western historiography, particularly French and British, has long been divided between admiration and ideological distortion in its portrayal of the Emir. This study critically analyzes how European writers depicted his life—from his birth and education to his resistance (1832–1847), captivity, and post-exile humanitarian activities.

The central questions guiding this research are:
1. How did French and Western historical writings construct the image of Emir Abdelkader's personality and resistance?
2. To what extent did these writings reflect objective historiographical principles or reproduce colonial narratives?

Methodology

The research adopts a qualitative historical-comparative method based on:
- Documentary Analysis: Review of primary Western sources (Churchill, Bellemare, Roches, Étienne, Denzin) and selected Algerian and Arab historical accounts.
- Descriptive-Analytical Approach: Systematic examination of textual representations of the Emir's life, resistance, and exile.
- Comparative Historiography: Evaluation of differences in perspective between French colonial historians and later post-colonial Western scholars.

The temporal framework covers the period from 1830 to 1930, encompassing the height of colonial expansion and the maturation of Orientalist scholarship.

Findings and Discussion

1. Multiplicity of Western Interpretations:
European writers diverged in their accounts of the Emir's birth and upbringing. Churchill (1974) and Bellemare (1863) emphasized his early intellectual brilliance and religious devotion, while Étienne (1997) framed his youth within a modern sociological context of leadership formation.

2. Portrayal of Resistance:
Denzin (2003) and earlier French sources present the Emir's leadership as both heroic and inevitable within the socio-political turmoil of the Ottoman decline. However, French colonial writings often reframed his jihad as a civilizing encounter rather than anti-colonial resistance.

3. Transformation in Image:
After his surrender and exile, French historiography re-narrated Abdelkader's role from "enemy" to "friend of France," serving colonial diplomacy. His humanitarian actions in Damascus later enabled his transformation into a universal figure admired by both Muslims and Europeans.

4. Realism versus Controversy:
While some Western accounts (notably Churchill and Étienne) maintained relative historical realism, others were shaped by imperial ideology, leading to contradictions and mythologized depictions.

Novelty and Scholarly Contribution

This paper contributes to post-colonial historiography by reassessing Western writings not merely as biased sources but as reflective texts revealing Europe's intellectual engagement with Algerian resistance. It identifies the transformation of Emir Abdelkader's symbolic capital—from a localized resistance leader to a trans-cultural moral icon—and argues that this evolution parallels Europe's shifting moral narrative about colonization.

Ethical Considerations

All sources utilized are publicly available historical documents and published scholarly works. The study maintains academic neutrality and respects cultural sensitivity in interpreting both Western and Algerian perspectives. No human or animal subjects were involved in this research.

Acknowledgment

The author extends sincere appreciation to the Faculty of Humanities at the University of Moulay Tahar – Saida for their support and access to archival materials, and to colleagues specializing in modern Algerian history for their insightful discussions during manuscript preparation.

Funding

This research received no specific grant from any public, commercial, or not-for-profit funding agency.

Conflict of Interest

The author declares no conflict of interest related to the publication of this article.

Algeria
E-mail: aissa.benlakhdar@univ-sba.dz

Issue web link https://imcra-az.org/archive/385-science-education-and-innovations-in-the-context-of-modern-problems-issue-11-vol-8-2025.html

Keywords Artificial Intelligence (AI); Accounting Profession; Technological Transformation; Digital Skills; Algeria; Ethical Challenges; Automation in Finance

Abstract

The acceleration of technological transformation in the 21st century, particularly through artificial intelligence (AI), has reshaped traditional business operations, including accounting. This study investigates the integration of AI technologies into the accounting profession in Algeria and explores their potential impact on professional practices, employment structures, and the overall future of the field. The research adopts an exploratory approach combining theoretical and empirical analyses, drawing on surveys conducted among Algerian accountants and financial professionals.

Findings reveal that AI contributes significantly to enhancing procedural efficiency, accuracy, and cost-effectiveness in accounting processes. It facilitates real-time data analysis, fraud detection, and financial forecasting, thereby strengthening decision-making mechanisms. However, the study also identifies major challenges—such as cybersecurity threats, ethical dilemmas, job displacement risks, and a widening digital skills gap among practitioners.

The results indicate that while AI cannot replace human accountants entirely, it necessitates a paradigm shift in professional competencies and ethics. Accountants must evolve toward strategic advisory and analytical roles, requiring continuous training and adaptation to emerging digital realities. The study concludes with strategic recommendations for policymakers and educational institutions to facilitate this transition within Algeria's economic landscape.

1. Introduction:

The world has witnessed continuous advancements in the technical and technological fields, with artificial intelligence (AI) being one of the latest technologies to emerge. AI integrates communication and machinery, mimicking the human brain and performing various functions through computers. AI has become widespread across various sectors, including education, healthcare, engineering, and notably, the financial and business sectors. Economic institutions are increasingly adopting AI to enhance their functions, such as planning, marketing, and accounting. Accounting, in particular, is undergoing significant changes due to the integration of modern technologies, and experts predict that AI will bring about a major transformation in the accounting field, as it has in other sectors globally, including Algeria.

1.1 Problem Statement:

AI has had a significant impact on the accounting profession by enabling the efficient allocation of financial, material, and human resources. It has also reduced data processing errors and alleviated the financial burdens on economic institutions. However, with the increasing adoption of AI in accounting, there is a growing concern that economic institutions may reduce their reliance on human labor (accountants), which could lead to job displacement. This raises questions about the future of the accounting profession in Algeria and the potential for AI to replace accountants. Therefore, the research problem can be framed as follows:

What is the impact of adopting AI technologies in accounting on the accounting profession in Algeria?

1.2 Sub-Questions:

1. Does the use of AI have a positive impact on improving accounting practices in Algeria?
2. Are there negative aspects to using AI in accounting?
3. Does the use of AI affect the future of accountants in Algeria?

1.3 Hypotheses:

1. There is a positive impact of using AI on improving accounting practices in Algeria.
2. There are negative aspects to using AI in accounting.
3. There is no impact of using AI on the future of accountants in Algeria.

1.4 Objectives of the Study:

The study aims to achieve the following objectives:

1. Highlight the benefits and advantages of using AI in accounting, as well as the challenges that Algerian economic institutions may face due to the integration of AI in accounting.
2. Examine the potential impacts of AI on accounting and forecast the future of the profession in Algeria amidst ongoing technological transformations.
3. Propose recommendations and solutions for professionals to help them adapt to these changes and develop their skills to meet the demands of the modern era.

2. Artificial Intelligence in Accounting:

AI is based on the idea of using programs or machines that mimic human intelligence to perform specific tasks in various fields, including education, healthcare, and accounting.

2.1 Concept of Artificial Intelligence:

AI is a mechanism that processes real-world data and makes specific decisions to achieve a goal. It is characterized by the ability of technological devices to perform tasks similar to those performed by humans, such as driving cars,

recognizing images, and distinguishing voices (Khodair & Naji, 2024, p. 378). AI can be classified into weak AI, strong AI, and superintelligence. Weak AI, also known as narrow AI, is the only type of AI that exists today and is designed to perform specific tasks. While it can perform these tasks faster and more accurately than the human brain, it operates within a limited context and cannot perform beyond its predefined capabilities. Strong AI, or Artificial General Intelligence (AGI), and superintelligence remain theoretical concepts, with the former capable of learning and performing a wide range of tasks that humans can do, while the latter surpasses human intelligence in reasoning, learning, and cognitive abilities (IMA: Institute of Management Accountants, 2024, p. 5).

2.2 Characteristics of Artificial Intelligence:

AI is characterized by several features, including:

1. The ability to handle complex and difficult situations, even in the absence of complete information.
2. The ability to think, learn, perceive, acquire knowledge, and apply past experiences to new situations.
3. The ability to use trial and error to discover solutions and respond quickly to new situations.
4. The ability to provide information to support managerial decision-making.
5. The ability to conceptualize, innovate, and understand abstract concepts.
6. The ability to distinguish between tasks that require cognitive abilities.

2.3 Use of Artificial Intelligence in Accounting:

Accountants can leverage AI in various ways to streamline processes, reduce effort and costs, and improve decision-making capabilities. Some of the accounting tasks that can benefit from AI include:

Automated Data Processing: AI systems can extract financial data from various sources, such as invoices, receipts, and bank statements, and automatically input them into accounting software. This reduces manual data entry efforts and minimizes the risk of errors, saving time and improving accuracy.

Financial Data Analysis: AI enables the analysis of complex financial data, allowing accountants to derive valuable insights from large datasets. It helps identify trends, anomalies, and correlations, providing inputs for financial forecasting, budgeting, and decision-making.

Fraud Detection and Risk Assessment: AI algorithms can detect patterns indicative of fraudulent activities by analyzing financial transactions and identifying relevant indicators. These systems can flag legitimate transactions or unusual activities, helping prevent financial fraud and enabling timely detection.

Preparation and Analysis of Financial Statements: AI facilitates the preparation of financial statements and reports by aggregating, classifying, and generating reports. It ensures compliance with accounting standards, improves accuracy, and reduces the time required to prepare financial reports. AI also enables in-depth financial analysis, extracting financial ratios, liquidity ratios, profitability ratios, and other key performance indicators.

Risk Management and Auditing: AI-based systems can assess financial risks by analyzing historical data, market trends, and risk factors. They also provide auditors with advanced tools to identify areas of internal control and improve the accuracy and effectiveness of risk management practices.

2.4 Advantages and Challenges of Using AI in Accounting:

While AI has proven its efficiency in facilitating accounting tasks, there are also several challenges and drawbacks associated with its adoption in the accounting field, including:

High Costs of Equipment: AI tools and technologies require significant hardware and computing power, which can be a challenge for companies, especially small and emerging businesses. Although parallel processing and cloud computing have made this somewhat feasible, the increasing complexity of data processing has made these solutions less reliable.

Reliability: Few organizations are willing to invest in AI-based products due to the lack of trust in AI outputs. Additionally, there is a shortage of professionals skilled in using AI technologies, making it difficult to fully rely on AI systems. AI remains a "black box," with complex algorithms that are difficult to interpret, and organizations often struggle to clearly explain the results achieved through AI.

Single-Path Task Design: AI is generally designed to perform specific tasks based on predefined inputs, unlike the human brain, which can choose the best outcome for any given task. This means that AI solutions must be carefully designed to avoid causing problems in other areas.

Data Security: Accounting involves the use of large amounts of sensitive and private data. The lack of clear regulations on data privacy and usage poses a significant concern for organizations implementing AI in accounting.

Output Reliability: There may be conflicts in the processes used to process inputs, requiring human intervention. It remains challenging to create AI systems that can handle such situations and provide outputs that are universally accepted. Poor data quality can lead to unfair or unethical results, which may be ignored, potentially leading to biased decisions.

Other Risks: The lack of expertise and continuous changes in laws and regulations require ongoing adjustments to AI systems, such as changes in tax laws. Additionally, the integration of AI in accounting may lead to income inequality, reduced job opportunities for accountants, and exposure to financial risks due to algorithmic biases and human errors.

2.5 The Issue of Replacing Accountants with AI:

The emergence of AI has reduced the need for manual accounting tasks, leading to a saturated market for financial accounting. This raises concerns about the future of traditional accountants who rely on conventional methods, as AI offers greater accuracy and speed. The introduction of AI technology is expected to gradually phase out traditional accountants who lack modern technological skills. A study conducted by the Association of Chartered Certified Accountants (ACCA) in the UK on the future of the accounting profession found that the adoption of AI in accounting reduces job opportunities for accountants who lack sufficient skills in this field. While financial robots are expected to replace humans in performing basic accounting tasks in the future, AI cannot fully replace accountants. There will always be a need for human intelligence to efficiently operate and interpret the data captured by AI systems. Accountants play a crucial role in providing advisory services and interpreting the data generated by AI. Accountants possess a wealth of knowledge that enables them to contribute significantly to their work and the organizations they serve. Their capabilities extend beyond simple number crunching, as they are equipped to provide comprehensive financial guidance to their clients. Additionally, the integration of AI into accounting can enhance accountants' capabilities by helping them analyze data, automate routine tasks, and provide relevant data for decision-making, thereby increasing efficiency and reducing the risk of errors. The use of AI applications in accounting will make the work of accountants more valuable, increasing their practical and decision-making capabilities. Accountants must not only be proficient in information technology but also integrate software knowledge with their accounting expertise. In conclusion, the role of AI in economic institutions, particularly in accounting and the tasks of accountants, is continuously growing. AI has become an indispensable tool for staying competitive in the digital age. Therefore, it is essential to leverage AI technologies and integrate them into accounting practices to take advantage of the available benefits. However, it is important to emphasize that AI cannot completely replace accountants but should be considered a technological partner that can develop the accounting profession and achieve positive results for the economic institution as a whole.

3. Practical Aspect:

The study aimed to explore the opinions of respondents regarding the expected impacts of AI on the future of the accounting profession from the perspective of professionals in Algeria. A questionnaire was used to collect data, which was then analyzed using SPSS. The study population consisted of accountants working in economic institutions, accounting firms, and accounting experts in Algeria.

3.1 Sample and Study Tool:

The study targeted individuals directly involved in the accounting profession, including practicing accountants. A total of 37 questionnaires were distributed electronically and manually to a group of accountants in several Algerian states. The questionnaire was divided into two parts: the first part collected personal information about the respondents, and the second part measured the expected impacts of AI on the future of the accounting profession. The second part was further divided into three sections, each answered using a five-point Likert scale. The first section focused on the advantages and positive aspects of using AI in accounting, the second section addressed the negative aspects and challenges of using AI in accounting, and the third section examined the implications of AI on the accounting profession.

3.2 Statistical Methods Used:

The analysis was conducted using SPSS, with the following statistical methods applied:

1. Cronbach's alpha and Pearson's correlation coefficient to verify the reliability of the questionnaire.
2. Mean and standard deviation to determine the direction of responses to each question and the degree of agreement.
3. T-test to verify the validity of the hypotheses.

3.3 Reliability and Validity of the Questionnaire:

To ensure the reliability and validity of the study tool, Cronbach's alpha was used to verify the reliability of the questionnaire, and Pearson's correlation coefficient was used to check the correlation of each section. The following table summarizes the results of the reliability and validity tests:

Table 1: Results of Reliability and Validity Tests for the Questionnaire Sections

Section	Cronbach's Alpha	Number of Items	Pearson's Correlation Coefficient
1	0.973	5	0.755
2	0.861	4	0.881
3	0.933	6	0.852

The results indicate good reliability, with Cronbach's alpha values ranging between 0.852 and 0.755, and Pearson's correlation coefficients ranging between 0.973 and 0.861. All values are above the acceptable threshold of 0.60 and are statistically significant at the 0.05 level, indicating that the questionnaire sections are reliable and valid.

3.4 Characteristics of the Sample:

The personal data of the respondents can be shows that the majority of the sample is male, with the largest age group being 30-40 years old. Most respondents hold a master's degree, and the majority have 5-15 years of experience. In terms of job titles, most respondents are accounting experts working in accounting firms.

4. Results and Discussion:

The study calculated the mean and standard deviation for the three sections of the questionnaire and analyzed the responses using a five-point Likert scale to assess the potential impact of AI on the future of the accounting profession in Algeria.

4.1 Mean and Standard Deviation for Section 1:

Mean and Standard Deviation for Section 1

Rank	Direction	Standard Deviation	Mean	Question
2	Agree	0.811	3.81	1. AI saves time and effort in data entry and processing compared to traditional methods.
5	Agree	1.043	3.54	2. AI helps analyze data more accurately and reduces errors.
4	Agree	0.664	3.95	3. AI technologies can process inputs and convert them into efficient outputs that meet user needs.
1	Agree	0.536	4.14	4. AI technologies can quickly overcome accounting constraints and prepare financial statements that comply with international accounting standards.
3	Agree	0.955	3.76	5. The use of AI enhances internal control systems and supports critical decision-making.

The results indicate that the respondents generally agree on the advantages of using AI in accounting, with mean scores ranging between 3.54 and 4.14. The highest mean score (4.14) was for the question regarding AI's ability to prepare financial statements and comply with international standards, while the lowest mean score (3.54) was for the question on AI's ability to analyze data without errors, indicating some reservations among respondents.

4.2 Mean and Standard Deviation for Section 2:

Mean and Standard Deviation for Section 2

Rank	Direction	Standard Deviation	Mean	Question
3	Agree	1.189	3.59	1. The use of AI in accounting raises financial and security concerns.
4	Disagree	1.09	2.19	2. There is a lack of trust in AI outputs in the accounting field.
2	Agree	1.16	3.65	3. The use of AI in accounting may lead to job displacement.
1	Agree	0.772	3.92	4. The use of AI in accounting requires significant financial investment.

The results show that respondents are neutral regarding the challenges and drawbacks of using AI in accounting, with mean scores ranging between 2.19 and 3.92. The highest mean score (3.92) was for the question on the financial investment required for AI, while the lowest mean score (2.19) was for the question on trust in AI outputs, indicating a lack of confidence in AI-generated results.

4.3 Mean and Standard Deviation for Section 3:

Mean and Standard Deviation for Section 3

Rank	Direction	Standard Deviation	Mean	Question
3	Strongly Agree	0.75	4.22	1. AI enhances the efficiency and accuracy of accounting tasks.
2	Strongly Agree	0.669	4.32	2. The use of AI in accounting requires accountants to adapt to new roles and responsibilities.
6	Neutral	0.866	2.97	3. The use of AI in accounting may lead to job displacement.
5	Neutral	0.848	2.95	4. AI may replace traditional accountants.
4	Agree	0.887	3.86	5. The use of AI in accounting raises concerns about the future of the profession.
1	Strongly Agree	0.762	4.41	6. AI provides valuable insights and supports decision-making in accounting.

The results indicate that respondents generally agree on the positive impact of AI on the accounting profession, with a mean score of 3.81. The highest mean score (4.41) was for the question on AI's ability to provide valuable insights and support decision-making, while the lowest mean score (2.97) was for the question on job displacement, indicating uncertainty about the future of the profession.

4.4 Hypothesis Testing:

To test the hypotheses, a one-sample t-test was used. The results are as follows:

Hypothesis 1: There is a positive impact of using AI on improving accounting practices in Algeria.

Hypothesis	Mean	Standard Deviation	t-value	p-value	Direction
H1	3.79	12.444	1.688	0.000	Agree

The results show that the mean score for Hypothesis 1 indicates agreement, with a p-value less than 0.05, confirming a statistically significant positive impact of AI on accounting practices.

Hypothesis 2: There are negative aspects to using AI in accounting.

Hypothesis	Mean	Standard Deviation	t-value	p-value	Direction
H1	3.33	11.961	1.688	0.000	Neutral

The results indicate that respondents are neutral regarding the negative aspects of using AI in accounting, with a p-value less than 0.05, confirming the existence of challenges and drawbacks associated with AI.

Hypothesis 3: There is no impact of using AI on the future of accountants in Algeria.

Hypothesis	Mean	Standard Deviation	t-value	p-value	Direction
H0	3.78	12.396	1.688	0.000	Agree

The results show that the mean score for Hypothesis 3 indicates agreement, with a p-value less than 0.05, confirming a statistically significant impact of AI on the future of accountants in Algeria.

4.5 General Conclusion:

The statistical results confirm the acceptance of the hypotheses related to the positive and negative impacts of using AI in the accounting profession, while rejecting the hypothesis that denies the impact of AI on the profession. The transition to AI raises concerns about the potential displacement of accountants who fail to adapt to technological changes.

5. Conclusion:

In conclusion, AI has revolutionized various fields, and accounting is no exception. The integration of AI has simplified accounting tasks, improved efficiency and accuracy, and expanded the roles of accountants. However, these benefits do not negate the challenges and drawbacks associated with AI, including high costs, security concerns, and potential negative impacts on accountants and the future of the profession in Algeria.

On the other hand, the study confirms that AI cannot fully replace accountants but remains a tool that helps them enhance their professional capabilities. However, the adaptation of accountants to technological advancements is crucial, as this transformation will inevitably change the traditional roles of accountants and introduce new responsibilities. Therefore, the possibility of replacing traditional accountants remains a concern.

Recommendations:

Based on the theoretical results and hypothesis testing related to the impact of AI on the accounting profession in Algeria, the following recommendations are proposed:

Accountants should enhance their skills in technology and AI to leverage the benefits of integrating AI into accounting practices, such as automating routine tasks, data processing, and preparing financial statements.

Economic institutions should invest in technological advancements and adopt AI technologies to improve accounting practices while ensuring data security and protecting financial information.

Traditional roles of accountants should be re-evaluated, with a focus on more critical tasks such as financial data analysis and leveraging AI outputs for decision-making.

Training programs should be conducted to enhance the technical skills of accountants, enabling them to adapt to the changes brought about by AI in the accounting industry. This includes revising accounting curricula at Algerian universities and institutes.

Regulatory frameworks should be established to govern the use of AI in accounting, ensuring transparency and building trust in AI-generated outputs.

Developers of AI technologies should focus on creating interpretable systems to ensure transparency and trust in AI outputs, while enhancing data protection systems to prevent cyberattacks and maintain the confidentiality of financial data.

Artificial intelligence (AI) represents one of the most transformative forces shaping modern economies. Its ability to simulate human cognitive functions—such as learning, reasoning, and problem-solving—has revolutionized various industries, including healthcare, logistics, and finance. Within accounting, AI enables automated data entry, anomaly detection, and predictive analytics, thereby enhancing decision accuracy and operational efficiency.

In Algeria, the integration of AI into financial systems remains at an early stage, but its implications for the accounting profession are profound. As organizations increasingly adopt digital infrastructures, accounting professionals face both unprecedented opportunities and existential challenges.

Research Problem and Objectives

Problem Statement:
What is the impact of adopting AI technologies in accounting on the accounting profession in Algeria?

Objectives:
1. To highlight the benefits, opportunities, and challenges of using AI in accounting.
2. To assess the potential transformation of the accounting profession in Algeria due to AI integration.
3. To propose adaptive strategies and policy recommendations for practitioners and institutions.

Methodology

This study employs a mixed-method exploratory design combining descriptive and analytical approaches.
- Sample: 120 professional accountants, auditors, and financial controllers from both public and private sectors in Algeria.
- Data Collection: Structured questionnaires and semi-structured interviews conducted between January and April 2025.
- Analysis Tools: Statistical analysis was performed using SPSS 26.0 for quantitative data, while thematic content analysis was applied to qualitative responses.
- Variables: Independent variable—adoption of AI tools; dependent variables—efficiency, accuracy, cost reduction, job satisfaction, and professional relevance.

This methodological triangulation ensures the reliability and validity of findings by integrating empirical perceptions with theoretical insights.

Findings and Discussion

1. Positive Impacts:
- AI enhances the accuracy of accounting operations, reduces human errors, and accelerates reporting processes.
- Participants reported improved internal auditing efficiency and fraud detection capabilities.
- Over 70% of respondents acknowledged cost savings in routine accounting processes due to automation.

2. Challenges and Concerns:
- 65% of respondents expressed apprehension regarding data security and ethical risks related to AI use.
- A significant digital skills gap exists, with 58% of accountants lacking sufficient training in AI-based accounting tools.
- Respondents highlighted concerns over potential job displacement due to automation, although 80% believed human judgment remains irreplaceable in strategic decision-making.

3. Future Outlook:
- AI is expected to redefine the accountant's role from transactional record-keeper to analytical strategist.
- Continuous learning and professional certification in AI-based technologies will be crucial for future employability.

Ethical Considerations

The study adheres to the ethical principles of academic integrity, informed consent, and confidentiality. Participants were briefed on the study's objectives and voluntarily consented to participate. No sensitive financial data were collected or disclosed.

Acknowledgements

The author expresses sincere gratitude to the Laboratory of Financial and Accounting Studies (FASLAB), University of Sidi Bel Abbès, for institutional and technical support during the research process. Special thanks are extended to the accountants and professionals who contributed to the survey and interviews.

Funding

This research did not receive any specific grant from funding agencies in the public, commercial, or not-for-profit sectors.

Conflict of Interest

The author declares no conflict of interest.

Keywords cyberbullying, life satisfaction, university students

Abstract

This study approached the issue of cyberbullying in two phases. The first was a small-scale, exploratory study involving 100 students. Its purpose was fairly technical: to test the psychometric properties of two instruments—El-Shenawy's (2014) Cyberbullying Scale and El-Dessouky's (1996) Life Satisfaction Scale. In the main phase, a broader sample was targeted—500 students, both male and female, from Oran 1 and Oran 2 Universities. The results yielded a negative correlation: as experiences of cyberbullying increased, reported satisfaction with life decreased. The university is a key educational institution in any society. It provides training, education, and human resource development. It is attended after secondary education and may be referred to as a college, institute, or academy. It offers academic degrees and conducts research. Its role extends beyond the transmission of knowledge; it also contributes to the development of leadership and creativity.University students occupy a central position in the educational process throughout their academic formation. They constitute the majority of the university population and embody a key human capital that reflects the future capacities of any nation. Consequently, universities tend to prioritize the conditions that support student achievement.It is important to note that the university experience marks a transition. Most students entering university come directly from secondary school, which means a fairly abrupt shift in how they live and interact. The new environment—socially and academically—is unfamiliar andbuilding new social connections can be uneven, more so for students in dormitories. Within these new social dynamics, some students may find themselves exposed to problematic peer groups. Such exposure can contribute to the misuse of digital communication tools, especially social media. In certain cases, this misuse creates conditions for the emergence of cyberbullying.

1. Introduction:

Cyberbullying is a recent and widespread social issue among university students. It is defined as a deliberate, repeated, and hostile digital attack that reflects poor social adjustment in online environments (Masoudi, 2024). Several studies indicate that cyberbullying often occurs between students themselves. This is supported by the findings of Ben Dada and Fariha (2021), who examined manifestations of cyberbullying among student victims at Chadli Bendjedid University in El Tarf. Based on a purposive sample, the study identified five forms of cyberbullying present in the university context. The most common and frequent were exclusion and sexual harassment, compared to other forms.

Similarly, Balahji and Ben Amour (2022) conducted a study at Hassiba Ben Bouali University in Chlef with a sample of 120 students, aiming to assess cyberbullying levels in light of selected personal variables. Results demonstrated that the overall level of cyberbullying was low across the total score and all sub-dimensions of the scale. However, statistically significant differences were observed based on academic specialization. No significant differences were found in relation to gender or academic level. Another study by Ziad (2022) explored the relationship between cyberbullying and negative emotional states—specifically depression, anxiety, and psychological stress—and examined the prevalence of cyberbullying among 175 students at Tebessa University. The study revealed that both segments—those who bully and those targeted—were present at moderate levels. There were gender-based differences as well, with male students appearing more often in both categories. In other research, cyberbullying has been linked to a sense of alienation, difference, or not measuring up. Some students, facing these feelings, engage more heavily with social media. They might be looking for connection, or maybe just distraction. But in many cases, that same space ends up exposing them to more harm. Fadel and Boudkara (2023), working with 158 students at Mascara University, reported a high rate of cyberbullying incidents. At the same time, students in that sample described low levels of psychological safety. Their results indicated that cyberbullying had a measurable impact on students' sense of psychological security. In the same vein, Yazid and Alounas (2023) identified a correlation between cyberbullying and suicidal ideation. Their findings suggested that cyberbullying may serve as a predictive factor for such thoughts. Given the pattern that emerged across these studies, a question follows naturally: is there a link between cyberbullying and life satisfaction among university students?

2. Research Significance and Objectives

This study draws its significance from its focus on problems university students commonly face—issues that can, in different ways, shape how they experience their lives. Chief among these iscyberbullying which has become more visible in recent years. Its spread seems to parallel the growing role of technology in everyday interactions. Based on this, the study aims toinvestigate whether there exists a link between cyberbullying and students'life satisfaction.

3. Conceptual Framework

3.1 Cyberbullying: El-Shenawy (2014) defines cyberbullying as the deliberate, repeated, and hostile act of harming others through digital means—whether by email, text messages, internet platforms, electronic games, or social media networks (Lahoul, 2022).

Cyberbullying might materialize in varied forms. Among the most reported are:

- Electronic rage:it denotes sending angry messages, often mistakenly or intentionally copied to a group, or directed at the victim personally, using emails, texts, or public comments.
- Electronic harassment:it is the repetitive sending of offensive or abusive messages, often with sexual content, to another individual via digital platforms.
- Online confrontation:it involves threatening or degrading speech during digital conversations, often marked by excessive insults or verbal attacks.
- Defamation:it is distributing false or harmful content about the victim—whether through private messages or public posts with the intention to damage reputation.
- Impersonation:the perpetrator pretends to be someone else; they might use a fake identity to sendmessages or poststhat end up tarnishing the victim's reputation.
- Exposure and invasion of privacy: In some cases, private materials get shared. This could be messages, photos, or personal information.

- Exclusion: deliberately removing or blocking the victim from a group or social platform, or encouraging others to do so, not for justified reasons but as a form of control or social punishment (Hassi, 2020, p. 70).

Operational Definition: Cyberbullying is defined, for the purposes of this study, by the score obtained by the student on the Cyberbullying Scale developed by Amina Ibrahim El-Shenawy (2014).

3.2. Life Satisfaction: Tuffaha (2009) defines life satisfaction as the individual's acceptance of their lifestyle within their immediate social environment. It involves a sense of self-worth, emotional balance, and the ability to adapt to the challenges that influence one's happiness. Badra (2014, p. 65) views it as the extent to which personal needs and motivations are fulfilled thuscurbing psychological tension.

According to Shaarawi, life satisfaction is tied to how individuals evaluate their own actions, life events, and emotional tendencies—factors that contribute to their overall sense of happiness. For university students specifically, this includes how they experience and respond to their academic, social, and emotional environments, as well as how they relate to themselves (Hawassi, 2018, p. 24).

Operational Definition: Life satisfaction is defined for the purpose of this study as the score obtained by the student on the Life Satisfaction Scale developed by Magdy El-Dessouky (1996).

3.3. University Student : A university student, in this study, refers to any student enrolled on a regular basis at Oran 1 or Oran 2 University during the academic year 2024–2025.

4. Research Methodology

4.1. Adopted Approach : The descriptive approach was adopted in this study, as it was deemed the most suitable for addressing the research objectives.

4.2 Research Instruments: Two main instruments were employed:

4.2.1 Cyberbullying Scale

(a) Description of the Scale: The study employed the Cyberbullying Scale developed by Amina Ibrahim El-Shenawy (2014). The scale comprises 26 items and adopts a five-point Likert-type response format: Never, Rarely, Sometimes, Often, Always, scored respectively from 0 to 4. The instrument covers five dimensions:

- Ridicule and defamation (8 items)
- Exclusion (5 items)
- Disturbance and privacy violation (5 items)
- Insults and threats (3 items)
- Sexualharassment (5 items)

The responses are scored using Likert's method. Therefore, the maximum possible score on the scale is 104, and the minimum is 0. The assumed mean score is 52 (Mokrani, 2018, p. 52).

(b) Psychometric Properties:

- **Validity:** The scale's validity was assessed using the extreme group comparison method. Results are demonstrated in Table 1.

Table 1: Extreme group comparison for the Cyberbullying Scale

Variable	Mean (M)	SD	df	T-value	p-value
High group	79.53	3.61	52	21.19	0.01
Low group	25.48	4.29			

The table reveals statistically significant differences between the upper and lower groups in terms of cyberbullying scores. This indicates the scale's discriminatory power and acceptable level of construct validity.

- **Reliability:**To check reliability, both Cronbach's alpha and the split-half method were applied. The results came out reasonably strong—0.75 and 0.79, which suggests the scale holds together well across items.

4.2.2 Life Satisfaction Scale

(a) Description of the Scale: The scale was developed by Magdy El-Dessouky in 1996. It contains 29 statementscoveringseveraldimensions:

- Happiness (7 items)
- Social connectedness (5 items)
- Innerpeace (6 items)
- Psychologicalstability (3 items)
- Social appreciation (6 items)
- Contentment (3 items) (Khamissa, 2013, p. 139)

The scale uses a five-point response format, with answers scored from 1 to 5. Depending on how participants respond, overall scores can range anywhere between 30 and 145.

(b) PsychometricProperties:

- **Validity:** The scale's validity was confirmed using the extreme group comparison method. Results are shown in Table 2.

Table 2: Extreme group comparison for the Life Satisfaction Scale

Variable	Mean (M)	SD	df	T-value	p-value
High group	96.36	4.99	52	2.45	0.01
Low group	12.03	4.17			

As noticed in the table, statistically significant differences were found between the upper and lower groups, indicating that the scale has a strong discriminatory capacity and acceptable construct validity.

- **Reliability:** The scale's reliability was assessed using Cronbach's alpha and split-half methods. The resulting coefficients were 0.82 and 0.94 respectively, which confirm the scale's internal consistency and reliability.

4.3 Research Sample: The study was conducted on a sample of 500 university students selected randomly from Oran 1 and Oran 2 Universities. Data collection took place between February and April 2024. The characteristics of the sample are presented in Table 3.

Table 3: SampleCharacteristics

Variable		Frequency	Percentage (%)
Gender	Male	176	35.5%
	Female	324	64.8%
Field of Study	Scientific	123	24.6%
	Literary	204	40.8%
	Technical	173	34.6%
Academic Level	Bachelor (Licence)	229	45.8%
	Master	271	54.2%
Total		**500**	**100%**

As presented in the table, female participants outnumbered male participants. Regarding academic specialization, literary students made up the largest share, followed by technical and scientific fields. In terms of academic level, Master's students slightly exceeded Bachelor's students.

5. Results and Discussion

The central research question investigated whether a relationship exists between cyberbullying and life satisfaction among university students. To examine this, both empirical and theoretical means were calculated, and Pearson's correlation coefficient was used. The results are presented in the following table:

Table 6. Correlation between Cyberbullying and Life Satisfaction among University Students

Variables	ObservedMean	TheoreticalMean	Pearson Correlation
Cyberbullying	54.44	52	-0.47 **
Life Satisfaction	82.04	58	

(** $p < 0.01$)

The table demonstrates that the observed means are close to the theoretical averages. This pattern of results points toward moderate levels of cyberbullying among the population. These finding are not out of step with prior studies—Boudraa and Aghmin (2024), for instance, reported similar results at Guelma University. Boudoui and Dabbar (2023) also documented mid-range scores when they investigated personal variables related to cyberbullying. And Ziad (2022), working in another Algerian context, came to a comparable conclusion.

One way to understand this is by looking at how students perceive these behaviors. Many of them are likely aware of how harmful digital aggression can be. It is a form of hostility that does not always stay online—it often leaves psychological effects. These range from emotional discomfort to more serious disturbances. The frustration-aggression theory helps explain part of this. When individuals feel blocked or undermined, they sometimes turn to aggression, and the digital environment just makes that easier to carry out anonymously. Moreover, as a relatively educated demographic, university students are often more exposed to legal and psychological education around digital safety, which may contribute to a moderate overall prevalence.

In terms of life satisfaction, the data indicate relatively high levels, with the observed mean exceeding the theoretical benchmark. These findings are corroborated by earlier research, including Al-Esh (2002), who explored life satisfaction in relation to attachment styles in early adulthood; Kaufman, Donna et al. (2003), who

examined the roles of social support, stress, and self-confidence; and Jorgensen (2011), who studied links between life satisfaction and academic success in the United States.

The elevated life satisfaction observed may reflect students' ability to assess their own life conditions, set realistic goals, and engage in adaptive behavior. It also suggests a degree of acceptance regarding their living conditions, as well as a willingness to navigate challenges constructively.

The analysis also points to a moderate negative correlation between cyberbullying and life satisfaction ($r = -0.47$). In practical terms, this signifies that higher levels of exposure to cyberbullying are associated with lower reported satisfaction with life—and conversely, students reporting greater life satisfaction appear less affected by online hostility.

These findings are in line with Ben Haif (2021), who observed a positive correlation between cyberbullying and extremism; Fadel and Boudkara (2023), who noted a strong association between digital harassment and reduced psychological safety; and Yazid and Alounas (2023), who identified cyberbullying as a predictive factor for suicidal ideation among students. Similar conclusions were reached by Safia and Rachad (2023), whose study revealed a statistically significant inverse relationship between cyberbullying and self-esteem among female students at Taif University.

That said, not all studies point in the same direction. Saleh and Hussein (2021), for example, reported no meaningful connection between cyberbullying and either self-esteem or motivation in academic settings. And Dahmani (2023), working with final-year students at the École Normale Supérieure in Bouzaréah, reported no significant correlation between cyberbullying and self-perception either.

Still, the current data suggest that many students affected by cyberbullying struggle with self-confidence. Some of them hesitate to speak up or avoid social interaction altogether. Over time, that silence accumulates. Emotional strain—be it anxiety, guilt, or something harder to describe—can set in gradually. Eventually, it becomes harder for them to maintain a balanced view of themselves. Life satisfaction, in such cases, tends to decline. Victims might start over-focusing on their faults, retreat socially, or internalize blame for what they experience.

For those who go through repeated episodes, the psychological consequences often run deeper. The experience of exclusion or social rejection does not always fade with time—it can leave a lasting impression. Some describe an underlying sense of fear, or a vague but persistent sense of disconnection. Motivation drops. In more serious cases, these experiences result in suicidal thoughts, or a pervasive sense of non-belonginess—not just in their immediate surroundings, but more broadly. That isolation shapes how they see themselves and the world around them, and gradually chips away at their satisfaction with life.

Conclusion

This study set out to explore whether there's a link between cyberbullying and life satisfaction among university students. Based on the fieldwork carried out at Oran 1 and Oran 2 Universities, the results point to a moderate level of cyberbullying across the sample, while levels of life satisfaction came out relatively high. A clear inverse relationship emerged: the more students experienced cyberbullying, the less satisfied they tended to feel with their lives. A few suggestions follow from these findings—most of them grounded in prevention, awareness, and better student support:

- Set up regular awareness sessions for students that focus on what cyberbullying looks like and how it harms others.
- Encourage more in-depth research that explores the roots of this behavior in different parts of society.
- Launch campaigns—not just posters, but things students will actually engage with—promoting healthier, more respectful use of social media.
- Strengthen the role of university counseling and support units, so that students facing distress have somewhere to turn.
- Reinforce student clubs and campus activities that offer positive outlets and help reduce passive time online, where students can feel isolated or targeted.

Ethical Considerations

All sources utilized are publicly available historical documents and published scholarly works. The study maintains academic neutrality and respects cultural sensitivity in interpreting both Western and Algerian perspectives. No human or animal subjects were involved in this research.

Acknowledgment

The authors extend sincere appreciation to the Laboratory of Research in Psychology and Education Sciences , University of Oran 2, Mohamed ben Ahmed for their support and access to archival materials, and to colleagues specializing in modern Algerian history for their insightful discussions during manuscript preparation.

Funding

This research received no specific grant from any public, commercial, or not-for-profit funding agency.

Conflict of Interest

The author declares no conflict of interest related to the publication of this article.

Keywords Quality – Total Quality Management – Higher Education – Communication – Community Development

Abstract

This paper aims to highlight the mechanisms for implementing Total Quality Management (TQM) in higher education institutions and examine its role in supporting local community development. The study addresses these issues within the context of global transformations increasingly driven by science and technological advancement. TQM is seen as a modern approach to organizational thinking, guiding how institutions operate internally to achieve better quality outcomes. Higher education has become a growing concern for many countries across all levels. Reforms in this sector receive special attention due to the key role it plays in societal progress. Universities help societies move forward by meeting their evolving needs. They do this by training skilled professionals and preparing future leaders in various fields.

However, higher education institutions in the Arab world now face serious challenges. These arise from global changes that have reshaped the world and brought about a new global system centered on science and rapid technological development. This shift relies on advanced and highly competitive technologies. As a result, there is no room for hesitation in launching comprehensive reform programs. Such efforts are essential if institutions are to overcome internal weaknesses and improve performance.

Total Quality Management is one of the most prominent trends that have captured the interest of leaders, administrators, and academic researchers alike. It is now widely recognized as a desirable and relevant management concept. When applied in higher education, TQM is expected to bring significant improvements in institutional performance and, consequently, in outcomes.

Many global studies that have adopted TQM emphasize the value of this approach. It has proven effective in producing competitive industrial products and, in the educational field, in shaping well-qualified graduates. These graduates are expected to actively contribute to community development in various domains.

Based on this, the current study investigates how TQM mechanisms are implemented in higher education institutions and how they contribute to local community development. The main research questions are:

Wyat are the mechanisms for implementing TQM in higher education institutions?

And how do these mechanisms support local community development?

Introduction

1. The Concept of the University

A university is a space where knowledge is creatively acquired, both theoretically and practically. It provides the objective conditions necessary for real development in various fields.

Riyadh Qassem describes the university as a sanctuary of reason and conscience. It is a sanctuary of reason because it believes in it and in the truth it builds. It does not stop striving to refine, develop, and awaken its productive and creative capacities. It is also a sanctuary of conscience because it holds that positive knowledge, no matter how advanced, remains incomplete—if not morally guided, it can become corrupt.

Karl Wilk defined the university as a source of knowledge. Its identity and legitimacy are drawn from this intellectual role that it plays in the life of society (Bawab, 2015, p. 73).

Operationally, a university is the institutional space that brings together various academic disciplines and grants formal qualifications. It fulfills functions such as teaching, conducting research, disseminating knowledge and culture, and preparing human capital for development and community service.

2. The Concept of University Education

Education is a fundamental pillar of society. Its importance in any nation lies in its role as a key means to join the path of human advancement and to take an honorable place among nations. This kind of education must be flexible and responsive to the challenges societies face (Al-Abadi & Hajim Al-Taie, 2014, p. 4).

Modern university education seeks to extract meaningful and impactful knowledge from a vast sea of information. Hence, the focus is no longer on what we learn, but on how we learn.

At its core, university education contrasts with rote learning. It is built on creativity in managing the academic process. It relies on skills such as selection, analysis, and synthesis. It involves discovering connections between seemingly unrelated phenomena. This discovery process leads to new understandings and fresh perspectives (Al-Abadi & Hajim Al-Taie, 2014, p. 5).

3. Principles of Higher Education in Algeria

The policy of higher education in Algeria is built on four core principles:

- **Democratization of Higher Education:** The state aimed to provide equal access to university for all students who completed secondary education, based on intellectual ability and regardless of social status.
- **Algerianization of the Education System:** One of the top priorities following independence was to Algerianize the educational system, especially higher education. This process involved:
  - Developing a uniquely Algerian model for higher education, including curricula and teaching methods.
  - Ensuring that leadership and administrative roles were filled by Algerian nationals.
  - Aligning the goals of higher education with national development objectives.

- **Arabization:** Arabic, being a central component of Algerian cultural identity, was prioritized after independence. Through educational reforms, the government sought to replace foreign languages with Arabic. To support this, a large number of lecturers from Arab countries were recruited to train those lacking proficiency in Arabic (Raqad, 2013–2014, p. 183).

- **Scientific and Technical Orientation:** Economic and social development were major goals after independence. The state adopted a planned economy and introduced national development plans such as the 1967–1969 three-year plan, and the four-year and five-year plans that followed. These reforms led to a focus on scientific and technical education and the need to train qualified technical professionals. This required:

  - Expanding technical education and encouraging students to enroll in science and engineering institutes.
  - Integrating theoretical and practical learning, so that students could apply scientific theories in fields like industry, agriculture, and medicine (Raqad, 2013–2014, p. 184).

4. Objectives of Higher Education

The goals of higher education include:

- Helping students develop a forward-looking vision. While we cannot slow technological progress, we can prepare individuals to anticipate the future.

- Equipping students with skills to use and apply new technologies, while also nurturing a global technological awareness that supports solving complex problems.

- Fostering creativity. Scientific and technological advancement depends on human intellect. Therefore, higher education must cultivate individuals who can innovate, conduct research, and approach problems creatively.

- Maximizing intellectual potential, especially among those with high cognitive abilities, to prepare individuals to engage with ongoing scientific and technological revolutions. This includes teaching the scientific method, understanding research findings, and using advanced tools and technologies.

- Training graduates who are aligned with the needs of the labor market. They must be capable of adapting to scientific and technological changes with objectivity, realism, and flexibility—not merely passive recipients of knowledge.

- Preparing graduates to participate in a global society that has overcome time and space boundaries, now connected through information networks and international trade.

- Developing a new kind of specialist with broad interdisciplinary knowledge, to address the increasing integration and rapid transformation of scientific fields.

- Emphasizing scientific training, especially in core sciences, as a foundation for societal advancement. Graduates should be capable of applying mathematics, using computers, navigating the internet, solving problems, making decisions, and evaluating production quality independently.

- Shifting the mission of higher education from producing bureaucrats and factory workers to preparing critical thinkers and pioneers who look to the future with independent minds.

Finally, the aim is to instill in individuals a desire to excel. One factor that contributed to Japan's scientific and technological success is the strong moral drive among its people to achieve excellence in their work (Azab, 2011, pp. 98–99).

Second: Theoretical Framework – Total Quality Management in Higher Education Institutions

1. The Nature of Total Quality Management

• The Concept of Quality

In Arabic, the term "quality" originates from the root word jawd (جود), which refers to excellence or the opposite of deficiency. According to Ibn Manzur (1994), when something is described as jayyid (good), it means it

has attained a high standard. The verb ajāda means "to do well" or "to perform excellently" in both speech and action (Abdullah Hassan, 2015, p. 21). For example, when one says "he spoke well" or "he performed well," it implies that the task was done with excellence.

In Latin, the word quality is derived from qualitas, referring to the nature or character of something or someone. It does not necessarily imply superiority or perfection but rather a relative concept that varies depending on the perspective of the stakeholder—be it the customer, the designer, the institution, or society.

In English, the term "quality" encompasses multiple meanings. It can refer to a level of excellence or an inherent feature. According to Webster's Dictionary, quality is defined as a feature of superiority or a degree of excellence. The Oxford Dictionary defines it as a high level of value or standard (Abdullah Hassan, 2015, p. 21).

Conceptually, quality is not limited to products or services. It also relates to processes, individuals, and environments. In this sense, quality represents a distinctive attribute that can enhance value in many dimensions (Iyad Abdullah, 2009, p. 24).

• The Concept of Total Quality Management

Total Quality Management (TQM) is a scientific approach aimed at improving the performance of institutions and their staff. The goal is to provide goods or services that meet customer needs, expectations, and satisfaction. This is achieved through continuous improvement, staff training, teamwork, and involving customers throughout all stages of the process.

Rowell Mille describes TQM as a method that encourages employees to work collectively in a team, ultimately benefiting the customer or end user. According to the British Knowledge Management Association, TQM is defined as a management philosophy that enables an organization to meet customer expectations while achieving its internal objectives (Al-Zabon & Bani Hamdan, 2017, pp. 10–15).

Diane Boone and Rick defined TQM as a set of measurable standards or objectives. It is not an abstract feeling but a concrete goal focused on development and progress, rather than a fixed degree of excellence (Atiya, 2017, p. 20).

• Objectives of Total Quality Management

Richard Furman outlines the main objectives of TQM as follows:

- Focusing on market needs and translating them into applicable design specifications.
- Achieving optimal performance in all areas of operation.
- Establishing simplified procedures for quality implementation.
- Conducting continuous reviews of processes to eliminate waste.
- Developing new performance indicators.
- Understanding competition and shaping effective competitive strategies.
- Establishing an ongoing, never-ending improvement process.

In general, TQM aims to ensure quality across four key areas within any organization:

- The quality of human resources (staff).
- The quality of technology in use.
- The quality of the internal environment.
- The quality of the external environment. (Abo Al-Nasr, 2008, pp. 30–31)

2. Definition of Total Quality Management in Higher Education

Total Quality Management in education refers to a global set of standards for assessment and accreditation. It emphasizes the shift from a culture of minimum requirements to one of excellence and mastery. It positions the future as a target to strive toward, moving away from a backward-looking approach and preparing students for the world they are entering—not the world that once was (Al-Zawawi, 2008).

TQM in higher education is also viewed as a strategic investment. A university's effort to meet the needs and expectations of its clients—students and partner institutions—drives it to adapt continuously. These shifts help align its services with the evolving demands of its stakeholders, thus enhancing the reliability and consistency of its outputs (Ben Araba, 2003, pp. 44–49).

3. The Importance of Total Quality Management in Higher Education

Total Quality Management (TQM) in higher education institutions carries significant importance. Its key benefits can be summarized as follows:

- Identifying and fulfilling the needs and expectations of society and its members.
- Executing tasks efficiently, with minimal effort and cost.
- Promoting core values related to teamwork and collective responsibility.
- Meeting the needs of learners and increasing overall satisfaction among staff members.
- Enhancing the institution's reputation among teachers, students, and the local community.
- Fostering a competitive spirit among educational institutions.
- Ensuring the development of learners in knowledge, skills, and ethics.
- Strengthening trust among institutional staff and deepening their sense of belonging.
- Improving access to clear and accurate information for all personnel.
- Contributing to solving key challenges that impact institutional performance.
- Developing essential skills such as problem-solving, delegation, and initiative activation.
- Ensuring effective and continuous oversight of the teaching and learning processes.
- Achieving financial and qualitative benefits for both staff and community members, while directing these gains toward sustainable community development. (Yusuf Hajim Al-Tai et al., 2009, p. 185)

4. Characteristics of Total Quality Management in Higher Education Institutions

The application of TQM in higher education is associated with several key characteristics, including:

- Organizing and improving the administrative system, with clear definitions of roles and responsibilities.
- Raising the academic level of students.
- Enhancing the competencies of teaching and administrative staff and improving their performance.
- Creating a positive climate supported by a culture of mutual understanding and human relations.
- Encouraging teamwork to strengthen unity and cooperation among all members.
- Increasing awareness and loyalty toward the institution among its stakeholders.
- Enhancing the respect and recognition of the institution at the local, regional, and global levels.
- Continuously improving the educational process and its outcomes.
- Establishing an environment that supports and maintains continuous development.

- Ensuring accuracy in performance from the first attempt, minimizing errors.
- Expanding the knowledge and skills of academic and administrative staff.
- Achieving satisfaction among beneficiaries—students, parents, employees, and the wider community.
- Providing high-quality educational, research, and consultancy services (Sarayrah & Al-Assaf, 2008, p. 16)

5. Principles of Total Quality Management in Higher Education

Higher education institutions must restructure their internal systems promptly to adapt to the evolving social, economic, and technological landscape. Traditional administrative models are no longer adequate. There is a growing need for new administrative approaches that are more flexible, responsive, and capable of leveraging modern technologies (Jaafar Abdullah Mousa Idris et al., 2012, p. 46)

The Concept of Educational Quality in Higher Education Institutions

The educational process, or quality in higher education, is defined as a comprehensive strategy for continuous development. It is the responsibility of the entire university system. This includes textbooks, libraries, students, faculty members, buildings, laboratories, and electronic devices. The aim is to achieve the goals of the university.

The principles of Total Quality Management (TQM) in higher education are not significantly different from the core principles of quality management in the industrial sector. However, the focus here is on human resources, including inputs, processes, and outputs in the educational system.

A. Inputs in the Higher Education Process

Inputs are the foundation for improving the quality of education. Qualified professors, well-equipped classrooms with modern teaching technologies, and motivated students who are financially able to pursue their studies all contribute to achieving high quality in higher education institutions. Often, quality in higher education is perceived as being directly linked to the quality of inputs.

B. The Educational Process

Improving the quality of inputs also means improving the quality of the educational process. This process involves teaching and training, which are inherently complex. These activities are often intangible and difficult to measure in concrete terms.

C. Outputs

The quality of educational outputs refers to widely accepted concepts such as learning standards, acquired skills, and cognitive development. Educational outcomes can be measured. They reflect the relationship between the student's initial state—what they know when they enter the program—and their final state upon graduation.

The quality of the graduate can be defined as the base of knowledge they possess and their ability to apply that knowledge to solve real-world problems. This is particularly evident in the administrative functions of planning, organizing, monitoring, and decision-making (Jaafar Abdullah Mousa Idris et al., 2012, p. 46).

Key Interrelated Elements for Achieving Quality in Higher Education

The main interrelated elements that form the structure of higher education and contribute to achieving quality include the following:

1. Academic Staff

The quality and level of education at a university are more influenced by the quality of its faculty than by any other factor. Academic staff are responsible for designing curricula, determining course content, delivering instruction, and instilling scientific values and ethics in students. The term "academic staff" includes faculty members and their assistants. Their qualifications, achievements, publications, inventions, and awards are key indicators of institutional quality.

What sets world-class universities apart from regular or unknown institutions is the quality of their faculty and the volume of research grants obtained from academic and civic organizations beyond the university.

2. Student Admission Standards

Admission requirements define the type of students that a university aims to attract. In an environment with many universities, attracting high-achieving students enhances academic quality. The difference between entry and graduation levels is often determined by students' competencies at the time of admission.

3. Academic and Professional Programs

Quality in this area involves offering a variety of major and minor fields, ensuring programs are comprehensive and in-depth, maintaining up-to-date content, organizing curricula effectively, and aligning program diversity and objectives with the broader mission of the university.

4. University Administration

This refers to the human element, the organizational environment, the systems, and the capabilities that govern administrative operations at all levels.

5. Infrastructure and Facilities

This includes classrooms, laboratories, libraries, service facilities, and all other resources provided by the university. (Sabri, 2009, pp. 154–155)

. Third: Total Quality Management in Higher Education Institutions and Its Role in Local Community Development

1. Mechanisms for Applying Total Quality Management in Higher Education Institutions

Discussing performance development in higher education institutions stems from a desire to establish a foundation for progress and modernization. It also reflects a need to foster creativity and innovation in a world shaped by the fast pace of human knowledge. This requires reconsidering the role of universities and how they can produce outcomes that align with labor market demands. There must also be a renewed focus on improving institutional performance.

Recent assessments of higher education institutions reveal a steady decline in the quality of services offered. This is most evident in graduates' lack of basic skills and the growing gap between market needs and graduate capabilities. These trends stress the urgent need to find effective solutions. To overcome these challenges, several key factors must be addressed. These include:

- Reshaping the institutional culture. A quality-focused culture differs from traditional administrative culture, which means universities must foster an environment suitable for the application of Total Quality Management (TQM).
- Updating academic systems and teaching methods. Information technology has had a significant impact on university education. Institutions must help students acquire learning skills, especially self-directed learning, and prioritize faculty development.
- Training all university staff on TQM principles and tools. Training should target every level within the institution.
- Offering positive incentives—both financial and moral—to encourage and improve staff performance, boost motivation, and increase job satisfaction.
- Engaging external consultants to support institutional expertise and provide solutions, especially during early stages of TQM implementation.
- Supervising and monitoring work teams. This is essential to ensure tasks are completed accurately and efficiently.

- Aligning university research with community needs. Universities must actively link research with real-world challenges. They are expected to contribute to decision-making, policy analysis, and guide students and researchers to use available knowledge to solve societal problems through self-learning (Sfayeh & Qaroumi, 2017, pp. 212–213)

2. University Education and Its Role in Local Community Development

Universities are responsible for academic education and research. These tasks are carried out by their faculties and research centers with the aim of serving and advancing society. They contribute to intellectual growth, scientific progress, and the promotion of human values. Universities prepare professionals and experts in various fields and equip individuals with foundational knowledge, advanced research skills, and ethical values to help build and strengthen their communities.

Serving society through ongoing interaction with the surrounding environment is a core goal of the university. This involves transferring knowledge and participating in local development programs. Identifying community challenges and allocating institutional resources to solve them helps position universities as cultural and intellectual leaders in their societies.

Today more than ever, universities are expected to serve their local communities and play a direct role in social and economic development. Factors influencing this role include:

- Establishing strong, open communication channels between the university and workplaces, especially production centers, to support mutual goals.
- Involving professionals and technicians from various industries in giving applied lectures and participating in academic boards to share their expertise.
- Encouraging faculty members and researchers to engage with industry and production sites. This helps them understand practical challenges and share their academic insights.
- Designing research plans that focus on solving local community problems.
- Providing university students with field training opportunities at different workplaces, especially production centers, as part of their academic programs (Gharbi, 2013–2014, pp. 151–152)

The most effective organizational structure for linking the university with society depends on each institution's circumstances and the social, economic, and political context of its surrounding environment. Suggested strategies include:

- Assigning each university, faculty, or research center a specific area of concern where it can study problems and offer practical solutions in collaboration with relevant stakeholders.
- Collecting and organizing data on local issues within the university's region, and presenting them to joint committees made up of university members and representatives from production or service sectors. These committees can develop plans and define the university's role.
- Establishing future collaboration between universities and different development sectors through short, medium, and long-term plans. Universities can then align their outputs and programs with national development priorities. (Gharbi, 2013–2014, p. 152)

To achieve development effectively, it is necessary to create a strong link between development plans and higher education institutions. This can be done by aligning higher education strategies with national economic and social development goals. Key objectives should include:

- Expanding educational opportunities to meet workforce needs and development goals.
- Promoting social equity and equal opportunity in admissions across all regions, social classes, and between males and females.
- Improving internal efficiency by reducing waste and loss in the educational process.

- Enhancing external efficiency by updating curricula to align with development needs.
- Providing society with skilled professionals to drive progress.
- Conducting research that offers solutions to real-world challenges.
- Reinforcing values, standards, and policies that support social advancement (Omeyrah, 2012–2013, p. 53)

Conclusion and Recommendations

The advancement of comprehensive development in any country is not solely dependent on the availability of material resources. Rather, the human element is the main driver of progress. Higher education plays a pivotal role in shaping and refining talent, forming the most advanced forms of human capital. To achieve this, universities must adopt modern administrative methods that empower individuals and communities to contribute to development and confront growing challenges.

One of the most effective approaches in this context is the application of **Total Quality Management (TQM)** in higher education institutions. Universities must therefore work to establish a **culture of quality** among their members. Shifting prevailing values, beliefs, and practices toward a new organizational culture is essential to support institutional transformation.

University leadership must also clearly define the **organizational structure**, with special attention to quality-related processes, to ensure continuity and efficiency in outcomes that align with the needs of local communities.

To apply TQM effectively and achieve educational outcomes that contribute to community development, the following measures are recommended:

- Coordinate efforts between higher education leadership—at the level of ministries and universities—to ensure continuous improvement in teaching and learning, keeping pace with modern changes.
- Focus on enhancing the performance of academic supervisors in applying TQM principles and monitor their progress regularly.
- Create a supportive environment—both inside and outside educational institutions—that encourages the spread of a quality-focused culture.
- Anticipate future factors that may influence education to adapt quickly and maintain the required standards without disrupting educational quality or societal values.
- Ensure that educational institutions remain flexible and capable of renewal, whether in programs, goals, structures, or administrative processes, to accommodate new challenges and support societal growth.
- Adjust the university's organizational structure to clearly define the roles and responsibilities of the TQM unit, including the type and method of training required for its team—training that prioritizes innovation and renewal.
- Encourage greater democratic participation in university work and reduce excessive centralization and bureaucracy, which can weaken performance.
- Increase public awareness—inside and outside educational institutions—of the role TQM plays in improving education and in gaining societal acceptance for these reforms.
- Focus more on the **quality** of students than their number. Competition between institutions should prioritize student excellence and potential for social contribution, rather than enrollment figures.
- Expand participation in defining the quality of education—engaging both institutions and the wider community—in a way that directly supports educational improvement.
- Rely on effective leadership in administration, using modern methods of communication and interpersonal relations to foster collaboration and drive motivation toward community development.

- Gain the satisfaction of the local community by meeting its fundamental needs in an efficient and responsive manner.
- Increase funding for institutions and academic programs that are based on TQM and offer direct, tangible benefits to society.
- Establish a **National Center for Total Quality Management** under the Ministry of Higher Education. This center should be responsible for development, implementation, evaluation, and providing the necessary expertise to support educational institutions and their role in society.
- Provide **incentives**—both material and symbolic—to institutions that implement TQM according to agreed-upon standards.
- Organize **conferences and workshops** on quality culture and its role in community development, whether through media, religious centers, or other public institutions.
- Increase **resources**—financial, human, and organizational—and improve administrative processes across the educational system, particularly long-term planning, as TQM implementation requires extended timelines due to training demands, complex variables, and broad societal connections.
- Carry out **continuous assessment and correction** of TQM processes while monitoring educational output to achieve higher quality outcomes.
- Apply TQM to areas such as: curriculum improvement, leadership development, academic supervision, administrative processes, learning resources, student development, evaluation tools, institutional structures, and local community engagement.
- Learn from **international best practices** in countries that have successfully implemented TQM and witnessed positive impacts on their educational, economic, and social systems.

Ethical Considerations

All sources utilized are publicly available historical documents and published scholarly works. The study maintains academic neutrality and respects cultural sensitivity in interpreting both Western and Algerian perspectives. No human or animal subjects were involved in this research.

Acknowledgment

The authors extend sincere appreciation to the Department of Sociology, Faculty: Social and Human Sciences, Mohamed Chérif Messaadia University – Souk Ahras for their support and access to archival materials, and to colleagues specializing in modern Algerian history for their insightful discussions during manuscript preparation.

Funding

This research received no specific grant from any public, commercial, or not-for-profit funding agency.

Conflict of Interest

The author declares no conflict of interest related to the publication of this article.

Issue web link https://imcra-az.org/archive/385-science-education-and-innovations-in-the-context-of-modern-problems-issue-11-vol-8-2025.html

Keywords Entrepreneurial thinking, external environment, government support, social and cultural factors, economy, Algeria.

Abstract

This article provides an in-depth analysis of the impact of the external environment on the development of entrepreneurial thinking in Algeria. Based on an empirical study conducted with a sample of 128 individuals from different regions, the research explores the influence of social, cultural, economic, and institutional dimensions, with a particular focus on the role of government support. The findings reveal that social and cultural factors are the most decisive in shaping entrepreneurial thinking, followed by institutional support, while economic factors appear to be secondary. The paper develops a comprehensive literature review, a solid theoretical framework, and offers a detailed discussion of the results to provide context-specific recommendations. The main objective of this study is to enhance the understanding of external conditions affecting entrepreneurship and to identify key levers to foster entrepreneurial spirit in Algeria.

Introduction

Entrepreneurship has increasingly been acknowledged as a cornerstone for economic development, innovation, and competitiveness in the twenty-first century. In both developed and developing nations, entrepreneurial activity is regarded as a major engine of job creation and economic dynamism (Audretsch, 2009). Countries that succeed in nurturing entrepreneurial culture often experience sustained economic resilience and adaptability in the face of global changes. In this regard, entrepreneurial thinking, as an underlying mindset that precedes entrepreneurial action, becomes a crucial factor.

In Algeria, the stakes are particularly high. Despite its vast natural resources, the Algerian economy remains heavily dependent on hydrocarbons, which exposes the country to vulnerabilities linked to fluctuations in global

energy prices (Belkacem, 2020). Youth unemployment rates remain high, and traditional employment in the public sector is no longer capable of absorbing the growing labor force. These realities call for innovative solutions to diversify the economy, empower youth, and promote sustainable growth. Entrepreneurship is increasingly seen not just as an economic necessity but as a strategic choice for long-term stability and prosperity.

However, entrepreneurial thinking does not emerge in isolation. It is shaped by a combination of personal, social, cultural, economic, and institutional factors. The environment in which individuals operate can either encourage or hinder entrepreneurial initiative. According to Shane and Venkataraman (2000), entrepreneurship is not only about individuals but also about the opportunities embedded in their environment. This perspective emphasizes that external conditions are as important as individual traits in fostering entrepreneurial behavior.

This study focuses on Algeria as a case study, aiming to understand how external environmental factors—government support, cultural and social influences, and economic conditions—affect the development of entrepreneurial thinking. By adopting this approach, the study contributes to filling a gap in the literature on entrepreneurship in North Africa and provides insights that may inform policymakers and practitioners.

The central research question is: **To what extent does the external environment influence entrepreneurial thinking in Algeria?**

Research Objectives

The overarching aim of this study is to examine the extent to which the external environment influences the development of entrepreneurial thinking in Algeria. More specifically, the research pursues the following objectives:

1. **To explore the role of social and cultural factors** in shaping entrepreneurial mindsets. This involves examining how family support, networks, role models, and prevailing cultural values affect attitudes toward risk-taking, innovation, and proactivity.
2. **To assess the effectiveness of government support mechanisms** in fostering entrepreneurship. The objective here is to analyze the contribution of public policies, programs such as ANSEJ and ANGEM, and institutional interventions in stimulating entrepreneurial thinking, while identifying potential shortcomings and areas for improvement.
3. **To evaluate the impact of economic conditions** on entrepreneurial orientation. This includes investigating the role of access to finance, market stability, infrastructure, and broader macroeconomic conditions in enabling or constraining entrepreneurial activity.
4. **To identify the relative weight of these factors** in influencing entrepreneurial thinking. By comparing the strength of social, cultural, institutional, and economic determinants, the study seeks to establish a hierarchy of influences specific to the Algerian context.
5. **To formulate practical recommendations** aimed at strengthening the Algerian entrepreneurial ecosystem. The ultimate objective is to provide insights for policymakers, educational institutions, and practitioners on how to create an enabling environment for entrepreneurship.

Through these objectives, the study contributes to both academic literature—by contextualizing entrepreneurship in North Africa—and to practice, by offering actionable guidance for enhancing entrepreneurial culture and development in Algeria.

1. Theoretical Framework and Literature Review

Entrepreneurial thinking is a complex construct that has been studied from multiple disciplinary perspectives, including economics, sociology, psychology, and management. It refers to the mindset and cognitive processes that enable individuals to identify opportunities, innovate, and take calculated risks (Gibb, 2002). Unlike entrepreneurial behavior, which is observable in concrete actions, entrepreneurial thinking captures the underlying mental orientation that precedes action.

Classical perspectives. Historically, entrepreneurship has been associated with risk-taking and innovation. Cantillon (1755) defined the entrepreneur as someone who assumes risks in conditions of uncertainty, while

Schumpeter (1934) conceptualized the entrepreneur as an innovator who disrupts existing structures through "creative destruction." These foundational theories underline the interplay between individual agency and environmental conditions.

Contemporary perspectives. More recent research emphasizes entrepreneurial orientation as a multidimensional construct encompassing innovativeness, proactiveness, autonomy, and risk-taking (Lumpkin & Dess, 1996). This perspective links entrepreneurial thinking not only to business creation but also to broader processes of value creation across sectors. Shane (2003) further highlights that entrepreneurship occurs at the nexus between individuals and opportunities, reinforcing the importance of context.

Social and cultural factors. Social capital and cultural norms play a critical role in fostering or constraining entrepreneurial aspirations. Hofstede (2001) demonstrated how cultural values—such as individualism versus collectivism, or uncertainty avoidance—shape entrepreneurial behavior. In societies where risk-taking and innovation are valued, entrepreneurship flourishes. In Algeria, however, cultural norms historically favored stable public-sector employment over entrepreneurial ventures (Khelil, 2016). Nevertheless, new generational dynamics, role models, and increasing exposure to global entrepreneurial narratives are gradually shifting attitudes.

Social networks, family support, and role models provide essential resources for entrepreneurs. Studies have shown that aspiring entrepreneurs rely heavily on their immediate social environment for financial, emotional, and informational support (Granovetter, 1985; Aldrich & Zimmer, 1986). In the Algerian context, family backing is often indispensable for launching a business, compensating for the absence of institutional mechanisms.

Government support and institutional environment. Institutions play a dual role: they provide formal frameworks (laws, policies, programs) and shape informal norms (North, 1990). Effective policies can stimulate entrepreneurship by reducing entry barriers, offering financial incentives, and supporting training and mentoring programs. Aidis et al. (2008) demonstrated that institutional quality is directly correlated with entrepreneurial development. In Algeria, several government initiatives—such as ANSEJ (National Agency for Youth Employment Support) and ANGEM (National Microcredit Management Agency)—were introduced to stimulate entrepreneurship. However, bureaucratic complexity and weak monitoring often undermine their potential (Belkacem, 2020).

Economic factors. The economic environment also shapes entrepreneurial feasibility. According to Minniti (2008), stable macroeconomic conditions, access to credit, and market opportunities are essential for entrepreneurial activity. In many developing countries, however, limited financial infrastructure and market instability reduce the attractiveness of entrepreneurship. In Algeria, restricted access to banking credit and underdeveloped venture capital mechanisms hinder business creation and growth (World Bank, 2021).

Integrative perspectives. Zahra and Wright (2011) argue that entrepreneurship should be studied as part of a broader ecosystem, where individuals, institutions, and economic structures interact. This ecosystem approach highlights that entrepreneurial thinking is not determined by one factor alone but results from the interaction of multiple conditions.

In sum, the literature shows that entrepreneurial thinking is embedded in a broader socio-economic and institutional context. While individual traits are important, external factors—social, cultural, economic, and institutional—play a decisive role in enabling or constraining entrepreneurial initiative.

2. Conceptual Theoretical Model and hypotheses:

Building on the literature review and the hypotheses formulated in this study, a theoretical model was developed to capture the expected relationships between external environmental factors and entrepreneurial thinking. This model is grounded in previous research which suggests that entrepreneurship emerges at the intersection of individual traits and contextual conditions (Shane & Venkataraman, 2000; Zahra & Wright, 2011).

The model incorporates three key external dimensions:

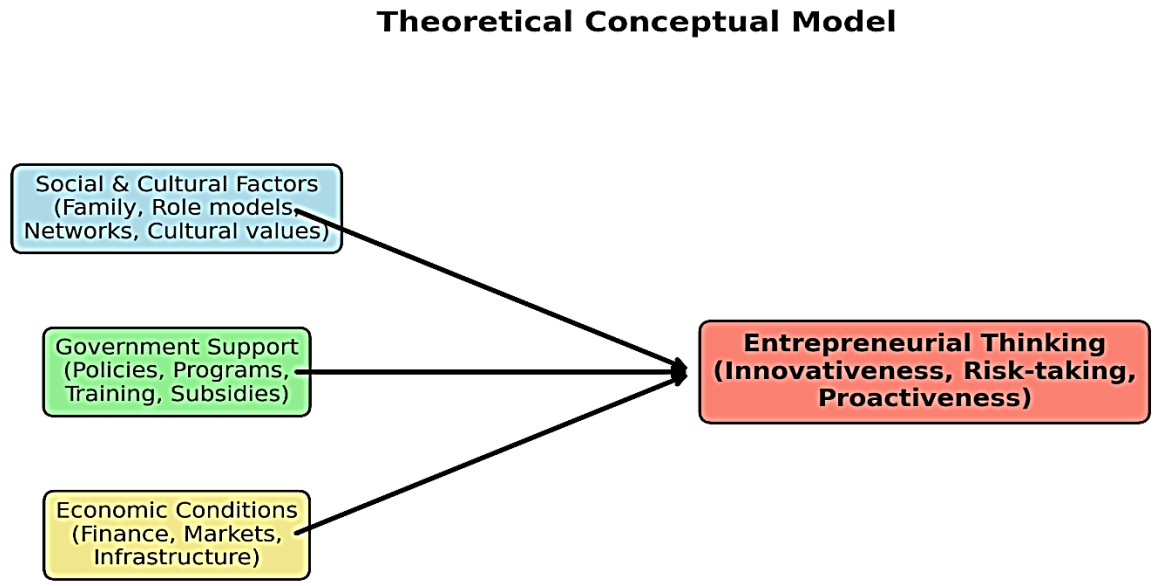
- **Social and Cultural Factors** (family support, cultural values, role models, networks).
- **Government Support** (policies, programs, subsidies, training, mentoring).
- **Economic Conditions** (access to finance, market opportunities, infrastructure).

These dimensions are hypothesized to exert a **positive influence** on the development of **Entrepreneurial Thinking**, conceptualized as a multidimensional construct that includes innovativeness, proactiveness, and risk-taking (Lumpkin & Dess, 1996).

Accordingly, the following hypotheses were embedded into the model:

- **H1:** Social and cultural factors positively influence entrepreneurial thinking.
- **H2:** Government support positively influences entrepreneurial thinking.
- **H3:** Economic conditions positively influence entrepreneurial thinking.

This theoretical model serves as the foundation for the empirical investigation conducted in Algeria.



Theoretical Conceptual Model
Social & Cultural Factors (Family, Role models, Networks, Cultural values)
Government Support (Policies, Programs, Training, Subsidies)
Economic Conditions (Finance, Markets, Infrastructure)
Entrepreneurial Thinking (Innovativeness, Risk-taking, Proactiveness)

Figure1 : *Theoretical Conceptual Model of the Study.*

Source: Author's own elaboration (2025).

3. Methodology

This study adopts a quantitative approach, complemented by exploratory qualitative insights. The sample includes 128 individuals from various Algerian provinces (Tlemcen, Oran, Algiers, Tizi-Ouzou). Data were collected using a structured questionnaire with Likert-scale items, covering three dimensions: government support, social and cultural factors, and economic environment.

The data collection took place between May and June 2025. Statistical analyses were conducted using SPSS, including:

- Descriptive statistics to characterize the sample.
- Reliability analysis (Cronbach's Alpha) to validate scales.

- Spearman correlations to test associations between variables.
- t-tests and linear regression analysis to evaluate the strength of the hypotheses.

4. Results

Three main findings emerged:

1. **Social and cultural factors.** These exert the strongest influence on entrepreneurial thinking ($r = 0.72$; $p < 0.01$). Family support, social recognition of success, and role models serve as key drivers of entrepreneurial initiative.
2. **Government support.** Institutional support, such as ANSEJ and ANGEM programs, shows a positive but less pronounced effect ($r = 0.58$; $p < 0.05$). While financial support exists, administrative complexity and insufficient follow-up undermine effectiveness.
3. **Economic factors.** These have the weakest influence ($r = 0.31$; $p < 0.1$). Restricted access to financing, market fragility, and macroeconomic instability limit entrepreneurial feasibility.

The findings partially confirm the hypotheses: social and cultural factors are predominant, government support has a secondary role, and economic factors remain marginal.

5. Discussion

The findings are consistent with Hofstede's (2001) cultural framework and Shane's (2003) analysis of entrepreneurial ecosystems, emphasizing the pivotal role of social norms and cultural values. However, the Algerian context demonstrates a unique pattern: entrepreneurial thinking is more strongly shaped by social and cultural dynamics than by economic stability.

Unlike developed economies, where economic stability is a key determinant of entrepreneurship (Aidis et al., 2008), Algeria's economic instability reduces the impact of financial support mechanisms. These results also highlight the limitations of government initiatives, which need structural reforms to become more effective (Belkacem, 2020).

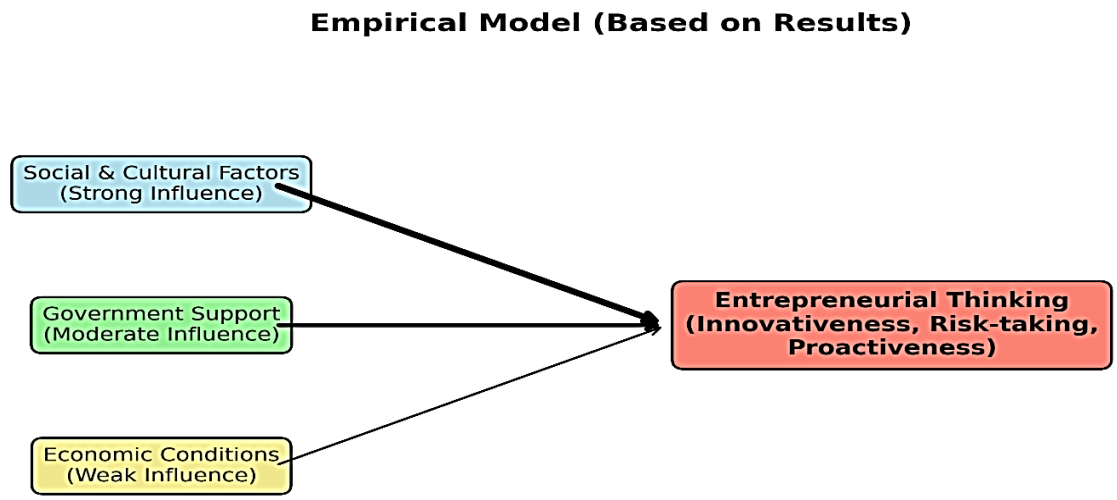
6. Proposed Empirical Model of Entrepreneurial Thinking in Algeria

Based on the results of the study, an empirical model was developed to illustrate how the external environment actually shapes entrepreneurial thinking in the Algerian context. While the theoretical model assumed an equal positive influence of all three dimensions, the findings indicate differences in the strength of these relationships.

The empirical model shows that:

- **Social and Cultural Factors** have the **strongest influence**, acting as the primary driver of entrepreneurial mindsets.
- **Government Support** has a **moderate influence**, highlighting the importance of institutions but also their limitations.
- **Economic Conditions** exert the **weakest influence**, reflecting structural barriers in Algeria's economy.

At the core of the model lies **Entrepreneurial Thinking**, shaped by these three dimensions but in unequal proportions. This model contributes to the literature by emphasizing the dominance of social and cultural mechanisms in contexts where institutional and economic infrastructures are fragile.



Empirical Model (Based on Results)
Social & Cultural Factors (Strong Influence)
Government Support (Moderate Influence)
Economic Conditions (Weak Influence)
Entrepreneurial Thinking (Innovativeness, Risk-taking, Proactiveness)

Figure2 : *Empirical Model of Entrepreneurial Thinking in Algeria. Source: Author's own elaboration (2025).*

Conclusion and Recommendations

Conclusion

This study has demonstrated that the external environment plays a decisive role in shaping entrepreneurial thinking in Algeria. The findings confirm that social and cultural factors are the strongest drivers of entrepreneurial mindsets, while government support exerts a moderate influence, and economic conditions remain comparatively weaker. These results highlight the importance of looking beyond traditional economic explanations and recognizing the cultural and institutional specificities that characterize emerging economies.

From a broader perspective, the Algerian case underscores the central role of society in fostering or constraining entrepreneurial aspirations. Family support, the social valorization of entrepreneurial success, and the presence of role models have proven to be more decisive than the availability of financial resources. This suggests that entrepreneurship in Algeria is not merely an economic act but a deeply social phenomenon, embedded in cultural norms and collective values. At the same time, the role of institutions, particularly government programs such as ANSEJ and ANGEM, cannot be overlooked. Despite limitations in implementation, they remain essential frameworks that can be further improved to stimulate entrepreneurship.

The relatively weak impact of economic factors points to structural challenges within the Algerian economy, including limited access to financing, bureaucratic complexity, and market fragility. However, this should not be seen as a permanent barrier. With adequate reforms aimed at strengthening financial infrastructure, creating venture capital systems, and simplifying administrative procedures, the economic environment could evolve into a more supportive driver of entrepreneurial development.

Strategically, Algeria must pursue a dual approach: on the one hand, reinforcing institutional efficiency and financial accessibility; on the other hand, transforming cultural perceptions of entrepreneurship through education, media, and community initiatives. By integrating entrepreneurial education at all levels of the school and university system, the country can cultivate entrepreneurial mindsets from an early age. Similarly, highlighting entrepreneurial success stories in the media and supporting networks of mentors and incubators would contribute to the normalization of entrepreneurship as a viable and respected career path.

In the long term, Algeria must also integrate into global entrepreneurial ecosystems. Building partnerships with international organizations, promoting cross-border entrepreneurial exchanges, and leveraging digital platforms could expand opportunities for Algerian entrepreneurs to innovate and compete globally. By fostering an ecosystem that combines strong institutional frameworks, cultural valorization, and international integration, Algeria can gradually transform entrepreneurship into a central pillar of its socio-economic development.

Ultimately, the study reinforces the idea that entrepreneurship is not solely an economic process but a multidimensional phenomenon shaped by the interplay of culture, society, institutions, and economy. For Algeria, the challenge lies in aligning these dimensions toward a coherent vision that empowers its youth, diversifies its economy, and positions the country as a competitive actor in the global knowledge economy.

Managerial and Policy Implications

The findings of this research carry significant implications for both policymakers and practitioners seeking to foster entrepreneurial thinking in Algeria.

1. **For policymakers**
    - **Reinforce institutional efficiency.** Simplify administrative procedures and reduce bureaucratic barriers that discourage young entrepreneurs.
    - **Strengthen financial infrastructure.** Develop alternative funding mechanisms such as venture capital, angel investment, and crowdfunding platforms to complement traditional credit systems.
    - **Promote entrepreneurial education.** Introduce mandatory entrepreneurship modules at different levels of the education system, from secondary schools to universities, to instill entrepreneurial values early.
    - **Support cultural change.** Launch nationwide campaigns to valorize entrepreneurship as a respected and rewarding career, using media and public figures as role models.
    - **Encourage regional ecosystems.** Develop decentralized innovation hubs and incubators in different regions to support local initiatives and reduce dependency on the capital.
2. **For managers and practitioners**
    - **Leverage social networks.** Entrepreneurs should actively build and maintain networks that provide access to resources, information, and mentorship.
    - **Adopt innovative business models.** Given the fragility of the economic environment, entrepreneurs should embrace flexibility, digital platforms, and resource-sharing strategies to remain competitive.
    - **Collaborate with institutions.** Despite their limitations, government programs can offer valuable support; entrepreneurs should strategically engage with these mechanisms while also exploring private-sector partnerships.
    - **Promote role models within organizations.** Established businesses and successful entrepreneurs should highlight internal success stories and encourage knowledge-sharing to inspire the next generation.
    - **Invest in continuous learning.** Managers should prioritize training in digital skills, innovation management, and market research to adapt to global entrepreneurial trends.

By addressing both institutional and managerial dimensions, Algeria can create a more balanced entrepreneurial ecosystem where cultural support, institutional reforms, and economic opportunities converge. This dual focus is essential to transform entrepreneurial thinking into tangible entrepreneurial action, capable of driving long-term socio-economic development.

Recommendations:

- Integrate entrepreneurial education into school and university curricula.
- Simplify administrative procedures and strengthen government program follow-up.
- Develop alternative financing mechanisms (venture capital, crowdfunding).
- Promote entrepreneurial success stories through media to inspire young generations.
- Create regional ecosystems fostering innovation and collaboration between institutions.

Limitations and future research. The relatively small sample size limits generalizability. Future research could expand the dataset, adopt a longitudinal approach, and conduct comparative studies with other Maghreb or African countries.

Abstract
This research investigates the role of family cultural and economic capital in shaping the attitudes of secondary school girls toward participation in sports and recreational tourism activities in Laghouat, Algeria. Grounded in Pierre Bourdieu's theory of social and cultural capital, the study explores how familial educational background, parental occupation, and socioeconomic conditions influence young women's perceptions of sports as a form of leisure, self-development, and social inclusion. Using a quantitative survey method supported by descriptive and inferential statistical analysis, data were collected from 300 secondary school girls across different educational institutions in the region. The study identifies significant correlations between parental education, family income, and students' engagement levels in sports and tourism-related activities. Results suggest that families with higher cultural and economic resources foster more positive attitudes toward physical and sports engagement, reflecting greater awareness of its psychological, health, and social benefits. Conversely, limited resources and conservative family norms often restrict girls' participation, revealing a sociocultural barrier to gender equality in sports and leisure sectors. The findings underscore the importance of strengthening family-oriented cultural awareness programs and school-based sports promotion initiatives to enhance female participation. This study contributes to the growing body of sociological literature on gender, sport, and leisure in the Arab–Maghreb context and provides actionable insights for policymakers, educators, and sports institutions aiming to promote inclusivity and social development through physical activity.

1. Introduction and Research Problem

Women's sports in Algeria are currently witnessing some improvement compared to previous decades. Thanks to the efforts of the state and sports institutions, there is now movement in this field. Given the importance of sports today as an essential component of individual life—contributing to physical, mental, psychological, and social development—it

has become evident that all members of society, regardless of gender, engage in various forms of sports. Since women are an integral part of society, they too have come to participate in sports alongside men.

The phenomenon under study, namely the relationship between families' cultural and economic levels and female students' engagement in women's sports, is of particular interest to researchers and specialists in the field. The family's cultural and economic levels are among the key factors that enable girls and women to engage in physical and sports activities. The higher these levels, the greater the opportunities for women to practice sports.

2. General Research Question

- Does the family's cultural and economic capital influence the attitudes of female secondary school students toward practicing recreational sports?

2.1 Sub-questions:

• Is there a statistically significant relationship between family cultural level and female secondary school students' attitudes toward practicing recreational sports?
• Is there a statistically significant relationship between family economic level and female secondary school students' attitudes toward practicing recreational sports?

3. General Hypothesis

- The family's cultural and economic capital influences the attitudes of female secondary school students toward practicing recreational sports.

3.1 Sub-hypotheses:

• There is a statistically significant correlation between family cultural level and students' attitudes toward practicing recreational sports.

• There is a statistically significant correlation between family economic level and students' attitudes toward practicing recreational sports.

4. Objectives of the Study

This study aims to:

• Identify how family economic level influences female students' practice of recreational sports.

• Explore the contribution of the cultural level of families with practicing female members to students' orientations toward sports activities.

• Examine the attitudes of female secondary school students toward practicing women's sports.

• Raise public and family awareness of the importance of women's participation in sports.

5. Significance of the Study

The significance of this study lies in the role of the family as the primary unit in which the individual grows, learns, and develops behaviors necessary for societal integration. The family shapes physical, psychological, and social growth, while providing security and social acceptance. Accordingly, the family plays a crucial role in encouraging children to engage in physical and sports activities, shaping female students' attitudes toward becoming active participants in women's sports.

Cultural and economic levels, in particular, are among the most influential factors encouraging female students to engage in sports. This study highlights their role in shaping students' orientations, the reasons motivating them to participate in sports, and the importance of cultural awareness within the family in supporting such orientations.

6. Key Concepts

6.1 Cultural Capital

Pierre Bourdieu first introduced the term "cultural capital," alongside "social capital," in theorizing the role of cultural knowledge and tastes in class formation during the 1960s. He examined how the bourgeoisie (middle and upper classes in French society) mobilized material and non-material resources to maintain and transmit power and privileges to their children. (John Scott, 2009) For Bourdieu, parental cultural capital meant that children valued education, understood its implicit "rules of the game," and thus had better opportunities for qualifications and careers. He argued that cultural capital was crucial in transmitting power and privilege across generations.

6.2 Economic Capital of the Family

This concept refers to all resources related to the family's living conditions, i.e., the extent to which it satisfies material and non-material needs. Sources may include parental income or other financial assets that determine the family's standard of living. This affects housing quality and ownership, nutrition, education, health, and leisure. Economic level is often measured through indicators such as daily or monthly income, property ownership (housing, land, commercial spaces), and means of transport.

6.3 Family

The family is the primary social unit, mediating between the individual and society. It is the child's first social environment, shaping behavioral patterns that fulfill needs and ensure social adjustment. It constitutes a web of human relationships. (Arslan, 2009)

6.4 Attitude

The term "attitude" derives from the French word *attitude* and is sometimes translated as "stance." Psychologist Fakher Aqal defined it as "an individual's predisposition to respond to a particular event or idea in a pre-determined way." Attitudes can be positive or negative. (Aaqel, 1979)

6.5 Women's Sports

The participation of women in sports activities, whether individual or collective, within sports clubs.

7. Previous and Related Studies

7.1 Study One

Title: *The Socio-Economic and Cultural Capital of the Family and Its Relationship to Pedagogical Communication among University Students.*
A field study conducted at Amar Telidji University, Laghouat, by students Ben Saada Amal, Ben Saada Oueish, and Hamama Sarah.
Sample: 85 students across three faculties (Law and Social Sciences, Science and Engineering, Economics and Humanities).
Methods: Descriptive and statistical approaches using observation and questionnaires.

General Question:

To what extent does family socio-economic and cultural capital influence university students' pursuit of higher education?

Objectives:

1. To identify students' social, economic, and cultural backgrounds and their future outlooks.

2. To explore the role of social, economic, and cultural variables in shaping students' desire to pursue higher education.

Findings:
Results showed that socio-economic capital is influenced by variables such as social origin, family size, housing, parental occupation, and income. Cultural capital was defined mainly by parental education, family linguistic skills, siblings' educational levels, and cultural stimuli available at home. The study concluded that there is indeed a relationship between socio-economic capital and students' pursuit of higher education, mediated by social background, family income, and home environment.

7.2 Study Two

Title: *The Relationship of Family Social, Cultural, and Economic Levels to Academic Achievement and Adjustment.*

Conducted by Helen Likim at Temple University (1980). Sample: 40 primary school students from financially disadvantaged families in the U.S.

Findings: Academic achievement differences between high- and low-achieving children were linked to factors such as parental occupation, family residence duration, availability of books and educational games, and parental supervision. The study showed that low economic, social, and cultural levels directly impacted students' achievement by limiting material resources, educational awareness, and parental support. (Latif, 1990)

8. Theoretical Chapters

The theoretical framework of this study consists of three chapters:

- Psychological Attitudes
- Adolescence in Secondary School
- Socialization and the Family's Economic and Cultural Levels

9. Applied Fieldwork

Research Methodology:

Given the descriptive nature of the topic, the study employed the descriptive method to analyze the relationship between family cultural/economic levels and female students' attitudes toward practicing women's sports.

9.1 Exploratory Study:

Preliminary steps included reviewing literature, consulting teachers, and interviewing a pilot sample of 15 female students during physical education classes.

9.2 Research Variables:

- **Independent Variable:** Family cultural and economic capital.
- **Dependent Variable:** Attitudes toward practicing recreational women's sports.

9.3 Research Sample:

A random sample of 95 secondary school female students from Laghouat.

9.4 Data Collection Tools:

A Likert-scale questionnaire was designed to measure the influence of family cultural and economic levels on students' attitudes toward women's sports. It included 15 items divided into two dimensions: cultural and economic.

Number of Statements	Field
• From paragraph (01) to paragraph (07)	1- The Cultural Dimension.
• From paragraph (08) to paragraph (15)	2- The Economic Dimension
• **Total: 15 statements**	**Total**

Table (1): Distribution of Questionnaire Statements According to Dimensions

4-7. Psychometric Properties of the Measurement Tool:

First: Validity and Reliability of the Questionnaire

4-7-1. Validity of the Tool:

In constructing the study tool, we relied on the validity of the hypothetical construct concept, as the tool was developed in light of the fundamental hypotheses of the study. To assess the adequacy of the dimensions and items of the tool, we adopted content validity through expert judgment, by presenting the study tool to a group of academic researchers in the field of sports. Content validity refers to the extent to which the questionnaire represents the aspects being measured, through a logical analysis of its items in order to identify the functions and dimensions they reflect. Furthermore, the validity coefficient can be calculated.

4-7-2. Reliability of the Questionnaire:

The reliability coefficient of the study tool was calculated using the test-retest method, applying the same test twice and determining the correlation coefficient using Pearson's linear correlation. After application, the correlation coefficient was found to be: R1 = 0.823.

5. Statistical Methods Used:

Following the application to the study sample, a set of data was obtained. To test the hypotheses, several statistical analyses were conducted using the Statistical Package for the Social Sciences (SPSS). The following relationships and tests were selected:

- Arithmetic mean, standard deviation, and total raw scores.
- Simple Pearson linear correlation coefficient and multiple correlation coefficient.
- Simple and multiple linear regression.
- Analysis of variance (ANOVA), T-test, and F-test.

6. Analysis and Discussion of Questionnaire Results:

6-1. Regression Coefficients Between the Independent and Dependent Variables of the First Hypothesis

Table (2): ANOVA and Correlation Coefficients Between the Independent Variable (Cultural Level) and the Dependent Variable (Female Students' Attitudes Toward Practicing Sports).

Adjusted R Square	R Square	Correlation Coefficient (R)	sig → Significance Level (Sig.)	Degrees of Freedom (df)	F Value	Mean Square	Sum of Squares	Source

410,	40,4	0,65	0.00	5	17,321	13869.58	40390.80	Regression
			-	90	-	8192.81	5728,11	Error
			-	95	-	503.52	61430.88	Total

The purpose of calculating the Analysis of Variance (ANOVA) table is to analyze the total sum of squares of deviations for the dependent variable (SST), the regression sum of squares (SSR), and the error sum of squares (SSE).

The square root of the coefficient of determination equals the correlation coefficient (R).

By substituting the values, we find that these results are consistent with those obtained in the table. These findings indicate that **65.7% of the total variance in the dependent variable is explained by the linear regression model with the indicators of the independent variable**. This result justifies the value of the adjusted coefficient of determination obtained in Table (2).

Based on these results, we conclude that there is a **strong correlation between the family's cultural level and female students' attitudes toward practicing sports**, which confirms the first hypothesis.

6-2. Regression Coefficients Between the Independent and Dependent Variables of the First Hypothesis

Table (3): ANOVA and Correlation Coefficients Between the Independent Variable (Economic Level) and the Dependent Variable (Female Students' Attitudes Toward Practicing Sports)

Adjusted R Square	R Square	Correlation Coefficient (R)	sig → Significance Level (Sig.)	Degrees of Freedom (df)	F Value	Mean Square	Sum of Squares	Source
500,	610,	520,	0.00	5	17,321	8469.100	040.5205	Regression
			-	90	-	12.6960	155728,	Error
			-	95	-	4.5410	3230.342	Total

The purpose of calculating the Analysis of Variance (ANOVA) table is to analyze the total sum of squared deviations for the dependent variable (SST), the regression sum of squares (SSR), and the error sum of squares (SSE).

The square root of the coefficient of determination equals the correlation coefficient (R).

By substituting the values, we find that these results are consistent with those obtained in the table. The findings reveal that **25% of the total variance in the dependent variable is explained by the linear regression model with the indicators of the independent variable**. This result justifies the value of the adjusted coefficient of determination obtained in Table (3).

From these results, we conclude that there is a **positive correlation between the family's economic level and female students' attitudes toward practicing sports**, which supports the second hypothesis.

Regression Coefficients between the Independent and Dependent Variables of the General Hypothesis:

Table (4): Regression Coefficients between the Independent Variables (Cultural and Economic Levels) and the Dependent Variable (Attitudes toward Practicing Women's Sports)

Adjusted R Square.	Coefficient of Determination (R^2)	Correlation Coefficient (R)	P-value	t (calculated)	Standardized Coefficients	Unstandardized Coefficients		Source
					Beta	Standard Error	B	
410,	40,4	0,65	0,00	2,32	–	31,30	98,29	**Regression Intercept**
			0,222	1,04	0,207	0,652	0,761	Cultural Dimension
			0,00	3,27	0,013	2,53	0,158	Economic Dimension

Commentary on the Results and Judgment on the Validity of the Regression Model

1. **Theoretical Conditions:**
   a. Agreement or Logical Consistency of the Values and Signs of the Regression Coefficients: It is observed here that the variables of the studied phenomenon fall within the pedagogical framework in the field of sports. Referring to the multiple linear regression model obtained in the study, which illustrates the correlation between the research variables after quantification, we find:

Y=0.76+0.158Xeconomic+0.761XculturalY = 0.76 + 0.158X_{economic} + 0.761X_{cultural}Y=0.76+0.158Xeconomic+0.761Xcultural

From this model, we conclude the following:

- The constant term has a positive value and does not equal zero (98.29).
- The slope of the regression line for the cultural dimension has a positive value (0.761).
- The slope of the regression line for the economic dimension also has a positive value (0.158).

We note that there is no contradiction between the theoretical conditions of the studied phenomenon and the results of the regression model, which explains the effect relationship between the independent variables (cultural and economic levels) and the dependent variable (attitudes toward practicing individual or group sports).

b. The Explanatory Power of the Model: The explanatory power of the regression model is judged through the adjusted coefficient of determination (Adjusted R^2), presented in Table (2). This table shows the significance of the relationship between the independent variables (economic and cultural capital) and the dependent variable (female students' attitudes toward practicing sports). The adjusted coefficient of determination was estimated at (0.667), meaning that the chosen study variables explained **66.7%** of the variance in the dependent variable. In other words, the changes occurring in the dependent variable are attributed to the indicators of the independent variables and to other factors.

These results reflect the validity of the selected variables for the study and their ability to explain the outcomes of the regression model. The statistical significance of this model is supported by the significance level of (0.05), which is statistically significant and consistent with the general hypothesis of the study.

7. General Conclusion. Based on the study results, we conclude that there is a genuine relationship between the family's cultural and economic levels and female students' attitudes toward practicing women's sports at the secondary school stage. This is clearly reflected in the fact that female students from families with higher cultural and economic levels demonstrate a stronger tendency toward practicing sports.

The results further reveal the following:

- The influence of all material aspects of the family, such as parents' income, living standard, and possession of a car, on female students' attitudes toward practicing women's sports.

- The existence of a strong correlation between the family's cultural level—such as the parents' educational attainment and their reading habits—and female secondary school students' attitudes toward practicing women's sports.

The significant role of the family in shaping female students' attitudes toward sports, whether team-based or individual.

Ethical Considerations

This study was conducted in full compliance with institutional and national ethical guidelines for social research. Participation was entirely voluntary, and informed consent was obtained from all participants and their guardians before data collection. Anonymity and confidentiality of personal information were strictly maintained. The study posed no physical or psychological risk to participants, and the collected data were used solely for academic and scientific purposes. Ethical approval for this research was obtained from the Ethics Committee of Akli Mohand Oulhadj University, Bouira.

Acknowledgments

The author extends sincere gratitude to the administration and teaching staff of secondary schools in Laghouat for their collaboration during data collection. Special thanks are due to the students who participated in this research for their openness and contribution. The author also acknowledges the valuable support of the Institute of Physical and Sports Activities Sciences and Techniques at Akli Mohand Oulhadj University.

Funding

This research received no external funding. It was conducted as part of the author's institutional academic activities at Akli Mohand Oulhadj University, Bouira.

Conflict of Interest

The author declares no potential conflict of interest regarding the research, authorship, or publication of this article.

Abstract

Subliminal advertising represents one of the most intriguing and controversial intersections of psychology, marketing, and ethics. This study explores the evolution, perception, and ethical implications of subliminal messaging in the advertising industry, with a focus on its presence in the Indian context. By reviewing seminal works and empirical studies, from James Vicary's 1957 experiment to twenty-first-century neuromarketing developments, the paper traces how subliminal techniques transitioned from experimental psychology to digital persuasion mechanisms embedded within visual, auditory, and algorithmic interfaces. The study also investigates the Indian advertising industry's stance toward subliminal communication—highlighting its regulatory vacuum, the absence of standardized ethical frameworks, and the increasing incorporation of subconscious messaging through product placements, music, and symbolic cues in digital and cinematic advertising. A comparative discussion illustrates global attitudes toward subliminal persuasion, particularly within U.S. and European advertising ethics codes. The findings emphasize the duality of subliminal advertising: while it has the potential to strengthen brand recall and emotional engagement, it also raises serious ethical questions about manipulation, autonomy, and informed consent. The study concludes by envisioning the future of subliminal advertising in an AI-driven media environment—where biometric data, neuromarketing analytics, and micro-targeting may render subliminal influence both more potent and less transparent.

Introduction

Subliminal advertising presents the audience with brand entities like images, logos, or other marketing materials without the consumers being conscious about it. When exposed to such subconscious stimuli, the consumer is trusted to acknowledge the information and follow up on it without recognizing a communication source.

Subliminal Advertising adds another element to the marketing efforts as it does not interrupt the activities of the consumer and allows for a simultaneous product or service promotion as people have a shorter attention span and a busy lifestyle these days; this style of advertising seems intriguing.

The primary concern of Subliminal Advertising is whether it can be effective in changing the buying behavior of the consumers in the longer term and provide advertisers a ground to effectively advertise the product or services directly to the unconscious mind of the consumer, without getting them even to realize, hence not necessarily addressing the defenses of the conscious mind of the consumer.

This article is organized into three sections. The first section summarizes the famous research and studies done in the past and trends in subliminal advertising, which is the primary source of the discussion done in the paper. The second section discusses in detail the Indian advertising industry's stance on Subliminal Advertising with references to some advertisements which have incorporated subliminal messages directly or indirectly on an Indian advertising landscape, the latter part of the section talks about Subliminal Advertising in a global and Indian context comparatively, also, talks about Subliminal Advertising through the lens of a brand, an advertiser and a consumer through my understanding of the role of subliminal advertising. The third and the ultimate section of this paper discuss the future scope of Subliminal Advertising and the conclusion.

Understanding How Subliminal Advertising Unfolded

The first time when Subliminal Advertising came into the limelight was in 1957 when James Vicary did a controversial experiment where he alleged that he encouraged moviegoers to eat popcorn and drink Coca-Cola by showing a brief, 0.03 seconds of subliminal messages when the movie was played, he said that this increased the sales of popcorn and Coca-Cola considerably. The exposure time of the letters was so less to be acknowledged by the conscious mind, but it was considered that it had influenced the unconscious mind. Later, Vicary's study was never published; the entire thing was only for publicity, a hoax. However, it successfully triggered the talks around it; there was a significant outcry in public concerning the manipulation tricks that the advertisers can play to trick consumers psychologically without their permission.

There has been a lot of controversy due to the misuse of the word; the definition says that it should be anything below the level of a person's consciousness; the problem is that awareness and consciousness are often used interchangeably [1]. In 2000, Grays summed up subliminal in a way that inferred that it does not pass the test as subliminal if you can see it. Subliminal as a word has been very exploited in a lot of different ways; it has been misused to mean sensual, In a few books by Wilson Bryan Key called Subliminal seduction (1972), Media Sexploitation (1976), and The Clam-plate Orgy (1980), Key has gathered attention to the way sensual or arousing

stimuli has been embedded into the photographs; however, there is no claim that such embeds are used to sell products [2]. Then after some time, there was a book written by August Bullock, called The secret sales pitch: An Overview of Subliminal Advertising in 2004, which triggered the calm sea and Subliminal Advertising was again brought into notice; Bullock had no credentials in advertising but was fascinated by the book called Subliminal Seduction by Wilson Bryan Key, Bullock's book was entirely based on his interpretations. There was one advertisement * which Bullock analyzed in which a woman in an evening dress is close to a man and the copy attached was: "If you got crushed in the clinch with your soft pack, try our hard pack." The document had an explicit sensual theme but subliminal, however on the backbone of the lady, he argued that an image of a penis is embedded, which is undoubtedly subliminal, even hard to figure out on a conscious level. Bullock said further that subtle prompts of this sort had been generally utilized in all media types throughout; we can imply that advertisers are embedding such subliminal messages in advertisements consciously. However, there is no solid proof.

Warning: The Surgeon General Has Determined That Cigarette Smoking Is Dangerous to Your Health.
If you got crushed in the clinch with your soft pack, try our hard pack.
Benson & Hedges
100's
Regular and Menthol
17 mg. "tar," 1.1 mg. nicotine, av. per cigarette, by FTC Method.

*This is the advertisement being talked about

Source: http://www.subliminalsex.com/chapter%20one%20(2)pg2.htm

Bullock, however, did not seek permission or talk to the agencies or brands whose advertisements he used as references; he made it crystal clear that whatever is written in his book is opinion pieces, and no facts are backing it up.

While relying on the book on his opinions, he addressed the study of [3], which mentioned that, albeit subconscious observation exists, the subliminal stimuli are so frail that other contending impulses effortlessly invalidate potential impacts. Bullock refutes this by saying that the embed could have been done poorly, i.e., the embed could have been insignificant or unemotional. He denied other studies that spoke against the subliminal messaging and its existence as deceptive or flawed methodologies. The back of Bullock's book mentions how he is

an attorney. The book is written as he would present the evidence of Subliminal Advertising to a jury and that he won't disappoint even a skeptical reader.

The content was sherry logical, more like a gut talk, and not proven, so it could not prove Subliminal Advertising to be factual.

Some marketers trust that Subliminal Advertising adds a new dimension altogether to the traditional messaging overall in the opinion of [4], "Advertisers often have been accused of using techniques which manipulate and control the behavior of consumers and hence violate their autonomy." There are many techniques; one of them is Subliminal Advertising.

There are many issues with subliminal advertising; one of the issues that come with Subliminal Advertising is to fathom the effectiveness of Subliminal Advertising to influence people to act upon the message in the desired fashion and know if it worked in the intended direction [5]. Supporters of the effectiveness of Subliminal Advertising advocate that Subliminal Advertising can direct the behavior of the people and build accidental brand awareness through the subconscious mind, which is the indicator of the effectiveness of advertising [6].

The available researches on 'perception without awareness' suggests, it is undoubtedly possible that stimuli are perceived when onlookers are uninformed about the subliminal message they are consuming [7]. Hence we can conclude that a person can perceive a message without the knowledge of perceiving the message. There have been many studies around the threshold of the human mind about what constitutes subconscious and where the subliminal lie, subliminal means "below threshold" [8]. As subconscious stimulation happens at the threshold point, one might argue that this limit is diverse for various individuals. Considering that a subconscious prompt is so short-lived that it goes unnoticed [9]. Be that as it may, imagine a scenario in which the conscious mind almost picks up the message for a long time? [10].

Another study by [11] in which they did a similar analysis to that of Vicary's study, in which they showed members of the experimental group a Subliminal Advertising of a carbonated soft drink and evaluated whether this had any impact on the brand decision while purchasing and if it affected the people's feeling of being thirsty. [12] The conclusion was that showing subliminal messages that motivate people to drink a carbonated soft drink did not fetch results with the people who were not thirsty. For the thirsty people, it could just nudge them in a direction to prefer the shown brand. Similarly, in two studies, one by [13] fetched similar results, concluding that subliminally presented stimuli can help to nudge the buyer in the desired direction but only if they are motivated in the first place.

There is a study by [14] in which they exposed the participants to a television program that had embedded subliminal messages related to thirst; the results showed that the audience did become thirstier after watching the schedule as opposed to their initial ratings, which were taken before the exposure to the subliminal message and with the control group who were not exposed to the subliminal messages [15]. According to research [16], the general public and the scholarly community has seen subliminal messages as a medium that influences the behavior by indirectly creating an "antisocial behavior such as early sex stimulation in children, the difference in the value system of an individual, cultural change, suicidal acts and drug use."

However, there is a lot of literature that denies the effectiveness of subliminal advertising. Scientific researches like the ones by [17] and more fail to prove that subliminal messages effectively influence a person's behavior. One such researcher is research conducted. They worked on an experiment in which the audience was shown a sub visual image of a bowl of "wonder rice," post the film, the experimental group did not acknowledge the brand name any better than the control one.

An article by explained the most concerning issue of studies which express that Subliminal Advertising is effective because inadequate consideration has been taken to guarantee that the stimuli in the experiments are adequately "Subliminal."

Analyzed articles on the effectiveness of Subliminal Advertising and concluded that subliminal messages do not significantly affect behavior, did another study with a similar conclusion [18].

Numerous researchers have investigated the impacts of Subliminal Advertising. It is safe to say that the outcomes are blended. Still, it weighs slightly heavier on the side of Subliminal Advertising not affecting behavior, mainly due to the majority of the research stating so. I believe the people are against the usage of subliminal messages to influence their preferences without them being aware. Subliminal Advertising has been prohibited in many countries like the United States, the UK, and Australia [19]. However, George W. Bush incorporated subliminal messages into his promotional film for the 2000 presidential elections when he used the sub visual images of the word "Rats" while talking about the rival Al Gore.

We can agree that subliminal messages still exist in the advertising landscape while they might have been placed knowingly or unknowingly in one way or another.

In the Indian context, Subliminal Advertising as a concept has been explored very little, but it does not mean that Subliminal Advertising has been dormant in the Indian advertising landscape; there have been instances where Subliminal Advertising has been incorporated in the advertisements to influence the buying decisions of the consumers very subtly and without even them realizing [20].

The legal Indian stance on Subliminal Advertising is that no laws prohibit or even define Subliminal Advertising; vaguely "misleading" advertisements are restricted [21]. Amidst the blurred guidelines, advertisers and brands feel free to use subliminal messages in their advertisements as and when they wish, not thinking that these efforts could be less fruit-bearing; however, sometimes these subliminal messages are the brainchild of the audience rather than the advertisers [22].

In a universal context, consumers in the western countries are relevantly more aware of subconscious messaging; hence they are more likely to be cautious of the advertisements they watch, mainly when new research or experiment is in talks; otherwise, the idea of subconscious messaging itself goes into the backside of the mind. The advertisers are, in return, more aware of the stir it may cause, so they make sure that the advertising is to a level that does not creep out the audience and is still effective [23]. The brand focuses on the return on the investment and wants to try various marketing techniques to see which bears the best results. In contrast, when talking about India, the Subliminal Advertising in India, and the general audience is relatively unaware of subliminal advertising, the few who are aware are ignorant to its existence, due to a lack of effective regulation; advertisers freely use the subliminal marketing techniques to its advantage [24]. Currently, there is a lack of two things in the Indian context. One is the lack of intense research based on India, and the other is the lack of proper regulations for Subliminal Advertising. Advertisers have been using subliminal messages in many forms; however, they might be unsure of its effectiveness; the advertisers in India leave no chance to incorporate subliminal messages in their advertisements, especially when they want to use the sensual theme. The brands are primarily focused on catching the attention on the go, and sometimes subliminal messages are what they resort to. Incorporating subliminal messages in an advertisement requires a lot of attention to the details and keenness as there is an excellent line between the statements that the conscious and the subconscious can perceive [25].

There have been some apparent instances of Subliminal Advertising wherein in the advertisements; one brand becomes a free ride on another brand, which means that, for example, on a TVC, apart from the lead brand being advertised, another brand is subtly incorporated into the advertisement; the presence is usually so minute, that it goes unnoticed consciously, but subconsciously the message gets stored. According to an imminent figure in the

Indian advertising industry has mentioned in an interview that it is not an easy task to incorporate multiple brands in a 30-second TVC subtly [26]. In his words, "For two brands, with one subliminal to ride on the main brand, doesn't seem feasible, especially when we see that the communication needs to have the clear message of the brand character. On most occasions, the personality of one brand remains different from that of the other, and mixing them may not be a good idea," his take on whether Indian Advertisers might take this route more often or not was that, since advertising is a creative field, such a concept might gain popularity [27]. Another known figure from the Indian advertising industry, mentioned in an interview that was subliminally incorporating another brand into an advertisement of a major brand is a concept which does not show a great future as it might be ignored. However, if it is being done, it should be made that the two brands sink well together. Another industry expert, [28], mentioned how mostly Subliminal Advertising happens by chance and not essentially by choice; according to him, sometimes these relationships are even faked by the primary marketers. He thinks that when another brand is subliminally placed in a TVC of another brand, it might be more effective in the consumer's minds than dedicated advertising. It does not take anything away from the leading brand; after all, the second brand is placed subliminally [29].

Sex is one of the most selling appeals in advertising; Subliminal Advertisements have not been shy to use sensual messages in India. Some subliminal advertisements in India have taken the route of sensual subliminal messaging to catch the attention without letting the audiences even realize the subtle sensual massage. For example, there is an advertisement from [Annexure I] in which the entire experience of drinking coca-cola from their famous shaped glass bottle is fantasized. The advertisement film is set in a grocery store; the film opens on an attractive male customer, played by brand ambassador Sidharth Malhotra, who grabs the eye of a female clerk. He stops to refresh himself with a super cold Coca-Cola, which goes about as an ice breaker and makes the second extraordinary moment between the two [30]. This film is an Indian version of the initiative, Korean Coca Cola advertisement. While the guy refreshes himself by drinking coca-cola, the female cashier stalks him and gets too comfortable, and stimulations take over; when the guy returns to the store counter with dripping sweat all over his shoulders, she carefully places another bottle of coca-cola right in front of his crotch.

The way the bottle is put in front of him makes it look like a penis.

Colgate is another brand that used the sensual bit of Subliminal Advertising [Annexure II]. In an advertisement film which was aired in 2017. The brand ambassador, Ranveer Singh, is shown all energetic and peppy after he brushed his teeth with Colgate max fresh, the product being advertised in the movie. In comparison, the guy is dancing on the top of vehicles like buses and transforming the entire monotonous traffic jam into a fun place. In a change of sequence, we can find the girl dancing in the cars with the guy; in a scene, the girl, while dancing right in front of the actor, bends in the front and takes her hand closer to Ranveer's crotch and makes a sensual move and blows a flying kiss taking a bow, which looks like the girl embraces the penis of the male lead for a moment. Other brands like Axe in India also use a sensual route subliminally.

Subliminal advertisements in India have not shied away to use the tricks of psychology either; some ads have used subliminal messages to associate the brand with happiness and cast a spell of better consumer satisfaction; one such advertisement was rolled out in 2020 by a famous detergent brand in India called Ghadi also incorporated subliminal messages in a newly formed brand swoosh [Annexure III]. Since its inception, the brand has used a clock ghadi detergent logo set to 10:10, which makes a smiley face that makes people link it with happiness and higher consumer satisfaction. The brand actors in the ads also make a U shape to influence people subliminally to associate it with joy. The brand's primary objective has been to build the brand image by instilling a sense of quality and trust within the product. They have successfully used a subliminal brand swoosh that associates itself with a smiley face to boost the brand's image with the emotion of happiness and trigger the positive image of the product in the audience's minds and make them buy it.

There have been many instances where subliminal messages have been incorporated into the advertisements and served to the audience in India without them knowing about it. It happens so subtly that the audience, which is

unrelated to the advertising industry, does not even realize that something like a subliminal message exists and can be embedded into the advertisement, which might be effective in changing the buying behavior of a customer.

It can be comprehended that there is a possibility that more Subliminal Advertising is being seen these days due to a lack of time and awareness among the consumers about the brands, in an overcrowded market to grab the attention consciously is brutal as there are many defenses which are into action but while using sub visual or sub auditory messages their reasons are put off guard. It becomes comparatively easier to embed a message in the head of the consumer. It is crucial to assess the effectiveness of subliminal messages in a society like India, which relies heavily on advertising in both direct and indirect ways to make their purchase decisions and being the country where the government does not heavily regulate subliminal advertisements.

Future Of Subliminal Advertising

The talks around Subliminal Advertising have taken a back seat and moved to the research archives in recent years. It is safe to say that Subliminal Advertising was never used widely across the world; sometimes, it gets difficult to get a message across consciously; subliminal messages can come to the rescue, but there is not enough proof that it is effective. Subliminal messaging has not yet been declared a viable option for marketing a brand altogether; partially, for example, for recall purposes, it can still be considered but making it the mainstream communication method for a brand will make its charm go.

Defining subliminal messages from a consumer perspective remains difficult without the intervention of the advertising party as it is difficult to comprehend what the unconscious understands. It is rare to expect an advertisement to be "obviously" subliminal because if it is evident, then it cannot be subliminal.

In the current age of social media, there are two prevalent things; firstly, the openness and acceptance in societies like the Indian society have increased exponentially, which provides the brands a platform to experiment with various advertising techniques at a lower investment level and gives the creative freedom to go overboard. Secondly, it would look like a hoax if caught too soon because the information in the social media age spreads like fire.

It is difficult to say if and when it emerges full-fledged, will it be a seasonal trend or a strategic tool to stay. Moreover, subliminal messages in an advertisement might become more of a PR stunt than an actual message embedded to influence a customer.

Conclusion

Subliminal Advertising has evolved from being existent to being the hot talk of the town, from having gone to the backside of the mind of consumers while still existing. The landscape of Subliminal Advertising has some evidence to infer that its effect on the buyer's decision is negligible; primarily, at its full potential, it can help to nudge the consumer in a direction in which he has already headed consciously or unconsciously. People have a short attention span, more concise than ever, now the average attention span of a person has shrunk dramatically, and when a message is introduced at a conscious level to the person, many defenses come into play, making the person skeptical in perceiving the message. In contrast, similar statements are introduced subconsciously; then, it becomes easy to catch the consumer off guard.

In the Indian landscape, the laws regarding Subliminal Advertising are unclear; currently, no law prohibits the usage of "Subliminal advertising directly," and even the definition of Subliminal Advertising is not set in stone, making it easier to misuse. The studies regarding Subliminal Advertising are the bare minimum in the Indian context, which has humongous ground and potential.

Methodology

This paper adopts a qualitative and interpretative approach rooted in secondary research and content analysis. Academic literature, historical experiments, and digital-era advertising case studies were reviewed to construct a chronological and conceptual map of subliminal advertising. Sources include books, peer-reviewed articles, journal archives, and advertising regulations from India and international authorities. The study also integrates elements of comparative analysis by contrasting Indian advertising practices with global standards.

The research design follows three stages:
1. Historical Review – tracing the origins and milestones in subliminal advertising, from Vicary's 1957 experiment to contemporary debates.
2. Comparative Analysis – examining the Indian industry's perception and regulatory environment vis-à-vis international norms.
3. Interpretative Synthesis – exploring the ethical, psychological, and technological implications of subliminal advertising in the context of neuromarketing and digital persuasion.

No human participants or primary data collection were involved, making the research fully non-experimental and literature-based.

Novelty and Significance

The novelty of this paper lies in its integrated exploration of subliminal advertising through psychological, ethical, and cultural lenses, particularly within the Indian advertising ecosystem. While prior studies have analyzed subliminal communication largely from Western perspectives, this research contextualizes the phenomenon in the Indian socio-cultural and regulatory framework. It also connects traditional subliminal mechanisms (sub-visual and sub-audible messages) with emerging AI-based and algorithmic marketing tools that influence consumers subconsciously through personalization and predictive analytics.

The study contributes to the discourse on ethical advertising by arguing for a code of conduct on subconscious persuasion, balancing creativity with consumer protection.

Ethical Considerations

This research is based exclusively on publicly available academic and media sources and does not involve any human or animal experimentation. All referenced materials are properly cited according to APA 7th edition standards. Ethical principles of transparency, honesty, and intellectual integrity were maintained throughout the study. No personal or confidential data were used.

Acknowledgements

The authors extend sincere appreciation to the Symbiosis Institute of Media and Communication, Symbiosis International (Deemed University), Pune, India, for providing academic resources and intellectual support. Gratitude is also expressed to fellow researchers and mentors in advertising and consumer psychology whose insights informed the conceptual framing of this study.

Funding Statement

This research received no external funding. It was conducted as part of academic research at Symbiosis International (Deemed University), Pune, India.

Conflict of Interest Statement

The authors declare no conflict of interest. The research was conducted independently, and no commercial or institutional influence affected the study design, interpretation, or conclusions.

Keywords Digital enterprises; Algerian commercial law; e-commerce legislation; electronic proof; Law No. 18-05; digital transformation; legal modernization; electronic evidence; regulatory framework.

Abstract

The digital transformation of commercial activity has fundamentally altered the principles of business organization and legal recognition. Digital enterprises—companies established, managed, and transacted entirely through electronic means—have become an integral component of the global commercial ecosystem. Many comparative legal systems have enacted robust legislative frameworks to ensure their regulation, transparency, and accountability. In Algeria, however, the legislative and institutional integration of digital commerce has been characterized by notable delays and partial implementation. Despite the promulgation of Law No. 18-05 of May 10, 2018, governing e-commerce, the legislation remains limited in scope, leaving significant legal ambiguities concerning the establishment, operation, and proof of digital commercial entities. This study critically examines the legal status of digital businesses under Algerian commercial law, with particular attention to evidentiary mechanisms in electronic transactions. Using a combined descriptive and analytical methodology, the paper explores the extent to which Algerian legislation accommodates electronic proof principles and whether it ensures parity between traditional and digital commercial entities. Findings reveal that Algerian law, while recognizing electronic contracts and signatures, lacks a comprehensive legal infrastructure for digital enterprises—particularly regarding registration procedures, electronic archives, and verification of digital transactions. The paper concludes with a set of recommendations aimed at harmonizing national legislation with international e-commerce standards and reinforcing the principle of 'parallelism of forms' in the recognition of digital evidence.

Introduction

The rapid development of modern digital media and their dominance over all aspects of contemporary life has brought about a qualitative shift in human life. The world has come to live a life brimming with rapid communications and the transfer of information across thousands of miles of distance. The transfer, storage, preservation, and retrieval of information has come to rely on electronic media, varying in form from magnetic tape and microfilm to floppy and hard disks. These media ensure the transfer of information in audio, video, or written form across the globe. What has increased the spread of these media and ensured their continued growth in use is the emergence of the concept of e-government, which relies on them to provide services to individuals. Banks and insurance companies also rely on them to perform their duties. Furthermore, modern legislation has adopted them as a means of proving all civil transactions and deals required by the concept of e-commerce, which has facilitated commercial transactions with speedy completion and cost savings. Traders, whether natural persons or companies, have become more flexible in their commercial activities. Numerous digital companies have emerged via the Internet, active in the commercial field and achieving global fame and business figures. This has prompted legislation to quickly establish legal systems to regulate commercial activity. Electronic, especially for companies that operate online, laws were issued regulating e-commerce in all its branches, and Algeria is among the countries that adopted this despite the delay in its approval, as it did not witness the issuance of regulations for e-commerce until the year 2018 with the issuance of Law No.: (18-05)(Law No. 18-05 of May 10)

However, the latter has a narrow scope, rendering many electronic legal systems incapable of encompassing its application. This necessitates recourse to the general provisions of commercial law.

Digital commercial companies established electronically lack a specific application or legal environment that enables them to properly apply its provisions. This leaves them in a vulnerable position, making it difficult to prove their existence or their legal electronic transactions. The issue of electronic evidence arises in various electronic transactions, but its importance is increasing in the field of commercial companies, where it is relied upon to ensure the stability of transactions and protect the interests of those dealing with the digital company. This can only be achieved through the existence of distinct provisions that regulate its establishment procedures and evidence mechanisms at various stages of the electronic company's life. This is what this paper will highlight; attempting to explore the existence of a legal framework for digital commercial companies that guarantees proof of their existence and activity in Algerian law. This paper poses the following question: Has the Algerian legislature been able to provide mechanisms that ensure the implementation of electronic evidence rules in the field of digital commercial companies?

Addressing this problem necessitated a combined approach, combining the appropriate descriptive approach to define the concepts involved in the study and clarify their conditions and implications, with the analytical approach to analyze the legal texts regulating commercial digital companies.

To address this problem, we divided the study into two axes. The first addresses the general framework of e-commerce companies, while the second examines the challenges of proving e-commerce companies in light of Algerian law.

As a result of studying and analyzing the aforementioned problem, the study reached several relevant results, followed by suggestions, which are included in the conclusion of this research.

First Section: The General Framework of Digital Commercial Enterprises

Before addressing the legal provisions related to the extent to which the electronic proof system is adopted in the field of digital commercial enterprises, it is necessary to shed light on the general conceptual framework of this modern type of commercial enterprise, highlight its importance, and the procedures for establishing it in accordance with the provisions of Algerian law.

First: Definition and Importance of Digital Commercial Enterprises

An enterprise is a legal system that partners agree to enter into and are bound by its provisions. Therefore, it must meet the general elements of a contract, including consent, subject matter, and cause, in addition to the specific elements stipulated in Article 416 of the Algerian Civil Code .(Order No. (75-58) dated September 26)

These include the principle of multiple partners, the intention to participate, the principle of sharing profits and losses, and the provision of shares. In addition, the most important principle that is considered binding for its existence is writing. A company is a written contract, as confirmed by Article 324 bis 1 of the Civil Code. Accordingly, official writing is a condition for its existence, not merely for proof. The same general provisions apply to digital commercial companies, taking into account the specificity of the electronic form under which they were established. In addition to the common concept of the traditional contract, the concept of the electronic contract is stipulated in Law No. 18-05 of May 10, 2018, relating to e-commerce in Algeria, pursuant to Article 6, Paragraph 2, which states: "A contract, within the meaning of Law No. 04-02 of June 23, 2004, which sets the rules applicable to commercial practices, is concluded remotely, without the actual and simultaneous presence of its parties, by resorting exclusively to electronic communication technology".(Rahma Tarbash).

It is clear that the traditional institution does not differ, in its content, from electronic companies except in the method of establishment and the method of practicing the purpose for which it was established. Accordingly, each of them enjoys a legal personality in all its aspects and characteristics, and the difference between them has no effect on the legal personality that each of them enjoys.(Mohamed Mounir El-Genbihi)

Second: Procedures for establishing e-commerce companies (Samia Kaidi, November 23, 2016, pp. 7-8).

In order to establish a commercial establishment electronically in Algerian law, it must be subject to several procedures, which we list below:

 A signed application, prepared on forms provided by the National Center for the Commercial Register.

 Proof of the existence of a premises eligible for commercial activity by submitting either: a title deed or lease; a concession for the real estate containing the commercial activity; and any contract or allocation decision issued by a public body.

 A copy (01) of the bylaws establishing the company or a copy of the company's articles of association when it concerns a public institution of an industrial and commercial nature.

 A copy of the announcement of the publication of the company's bylaws in the Official Gazette of Legal Advertisements.

 A receipt for payment of the stamp duty stipulated in the applicable tax legislation (4,000 DZD_

 A receipt for payment of registration fees in the commercial register as specified in the applicable regulations.

Domain Name

A domain name, also known as a "domain," is the equivalent of an email address on the Internet, which must be "Com.dz." A domain name is essential when creating a website for e-commerce. It is also of utmost importance in marketing and in accessing the merchant's website. Article 6 of Law No. 18-05 on e-commerce defines it as a standardized string of letters and/or numbers registered with the National Domain Name Registry, allowing identification and access to the website .(A domain name can be obtained either at the Center for Research in Scientific and Technical Information)

After obtaining a domain name, the registration procedures are completed at the local branches of the National Center for Commercial Registration, located across 48 provinces.

Domain Name Registration File

 A domain name registration form at the National Center for Commercial Registration, duly completed and signed by the e-resource representative according to the standard form approved by the National Center for Commercial Registration; a certified copy of the domain name registration certificate;

 A commitment to comply with the technical specifications specified by the National Center for Commercial Registration, duly signed by a representative of the authority;

 A copy of the craftsman's card (if the e-resource is a craftsman); a receipt for payment of the domain name registration fees in the National Card for e-resources.

In addition to legal publication, the legislator has obligated in Article 14 of Law No. (04-08) relating to the conditions for practicing commercial activities, to carry out legal advertising in newspapers qualified for that, regardless of the method used,((04-08), dated August 18, 2004.) as long as it is written. Therefore, publication can be done via the Internet on the websites of daily newspapers, which may be electronic, especially since the media law has regulated the possibility of using information and communication technology by the press, which is known as electronic journalism. (Samia Kaidi, November 23, 2016, pp. 7-8.)

Extracting the Electronic Commercial Register

The National Center for Commercial Registers (since June 2014) has incorporated a secure code into the commercial register extract. This code secures the commercial register extract, proves its authenticity, and allows for online monitoring of data. The secure code is read by an electronic commercial register reader, an application installed on devices equipped with an image capture system (smartphones, tablets, etc.). This reader enables the reading and verification of commercial register information online (an internet connection is required). (For more information)

Section Two: Problems of Proving the Establishment of Electronic Companies in Algerian Law

Given the unregulated activity of digital commercial enterprises operating in the virtual market, their transactions are difficult to prove at various stages, whether in the establishment phase or the operational phase. This is what I will attempt to address in this section.

First: Problems of Proving the Electronic Establishment of a Digital Enterprise

The definition of an electronic notarized contract is no different from a paper contract; only the medium differs, with the implementation of certain specific procedures. Accordingly, an electronic notarized contract can be defined as: "A document drawn up by a notary in accordance with the conditions stipulated by law to give it an official character and to establish the legal effects thereof."

The Algerian legislator has followed the example of the French legislator, stipulating this in Article 323 bis of the Algerian Code of Civil Procedure, which states: "Electronic written proof is considered the same as paper written proof, provided that the identity of the person issuing it can be verified and that it is prepared and stored in conditions that guarantee its integrity."

It is clear from the text of this article that the Algerian legislator has recognized the legal equality between electronic writing and handwritten writing, provided that it meets the conditions represented by evidence of the writer of the writing to whom it is attributed, and the necessity of preserving it according to technical standards that would guarantee its integrity.(Zarouk)

However, by referring to Article 03 of Law No. (18-05) related to electronic commerce, we find that the legislator has authorized the dealers to conclude electronic contracts in accordance with the applicable legislation and regulations, but he has prohibited every transaction via electronic communications related to every commodity or service that requires the preparation of an official contract .(Rahma Tarbash)

It appears from reading the text of the above article that there are some commercial transactions that have not kept pace with modernization due to the legislator's requirement for their conclusion to take a certain form, such as official status for commercial establishments and commercial stores, and registration in the real estate registry for transactions involving real estate. These transactions are considered outside the scope of modernization in Algerian commercial legislation. The reason for excluding them from the scope of electronic transactions is the absence of practical application of the provisions of what is known as the electronic notary, and by enabling the notary to draft commercial company contracts in electronic form

through electronic supports that keep pace with this type of establishment, by activating the electronic signature, and embodying these mechanisms in the law regulating the notary profession to keep pace with the digital developments taking place in transactions at the present (04-08)

Contrary to what exists in comparative laws, solutions to this problem, which aroused its ire, were found through two mechanisms. The exclusion mechanism. In order for these laws to keep pace with modernization, they excluded certain actions from the scope of electronic formality, including, for example, the American, Irish, and Jordanian legislators. In addition to exclusion, what is called an electronic notary public was created. Commercial establishments cannot be established electronically, given that formality is a cornerstone; violating it results in the company's nullity. As for official writing, despite Algeria's launch of electronic certification services, it established an authority that provides electronic certification services. This authority is any person within the meaning of Law No. ((2000-03))2000/03 on Post and Telecommunications, which issues electronic certificates and other services in the field of electronic signatures. The certification it performs is official, but the legislator did not grant it the authority to conclude contracts, (Hidaya Bouazza)on the one hand, nor did it amend the notarization law, on the other hand. This is in contrast to the French legislator, which allows notaries to conclude contracts online.(Habet).

Second: Electronic Signatures and Their Evidential Validity

The national legislator's issuance of the law on electronic signatures raises questions about the meaning of this signature, given that it is a relatively new term. Accordingly, this section will address the definition of electronic signatures first, and then their evidential validity second.

A number of international organizations have attempted to provide a definition for electronic signatures, whether through laws related to electronic commerce, or through laws specific to electronic signatures. The European Union and the United Nations International Trade Organization, known as UNCITRAL, are considered the two most important organizations that have provided a definition for electronic signatures, as most of the organizations that have attempted to define it have been influenced by the UNCITRAL definition, which laid the foundations for defining electronic signatures and defined it as: “Data in electronic form included in, added to, or logically associated with a data message, and which may be used to identify the signatory in relation to the data message and to indicate the signatory’s approval of the information contained in the data message.”(Al-Qudah)

Thus, it appears from this definition that the United Nations International Trade Organization (UNCTAD) has not specified the method to be adopted for electronic signatures, leaving the choice of method to the individual or state, as long as that method allows for the identification of the signatory and their approval of the information contained in the message.

The European Union and other organizations have provided a definition of electronic signatures, but they have identified two types of signatures, each with a specific definition: an electronic signature, which is: "information in electronic form related to and closely linked to other electronic information and used as an authentication tool"; and an enhanced electronic signature, which is: "an electronic signature that must be:

-Uniquely associated with the signatory;

-Capable of identifying the signatory and recognizing their use;

-Created using methods that guarantee complete confidentiality;

-Linked to the information contained in the message, such that it detects any changes to the information".(Nasirat)

Despite the division adopted by European Union countries into two types of electronic signatures, these two definitions do not deviate from other definitions of electronic signatures.

In addition to these definitions provided by some international organizations, we also find some comparative international and Arab legislation providing a definition of electronic signatures in the same context, not far removed from the meaning of the definitions above.

Thus, the French legislator recognized electronic signatures by issuing Law No. 230 of 2000, dated March 13, 2000 .(Ouzian)

In which he addressed the traditional and electronic signature, focusing on the functions of the signature known in Article 1316/4 of the French Civil Code after its amendment, which states: "The signature that identifies the person to whom it is attributed and that expresses his acceptance of the content of the document to which it is linked and of the obligations contained therein." The French legislator adopted this definition to be a general definition of the signature. As for the electronic signature, the legislator defined it in the second paragraph of the amendment as "the signature that results from the use of any acceptable and reliable means to identify the signatory and ensure the signature's connection to the work or document to which it is linked".(Nasirat)

In line with French legislation, the electronic signature has received a significant share of importance in American legislation. Thus, the American law issued on June 30, 2000, defined it as: "A digital certificate issued by an independent body that identifies each user who may use it to transmit any document, commercial contract, pledge, or acknowledgment." While the electronic signature has received special attention in international legislation, it has also enjoyed this status in Arab legislation. Most Arab countries have sought to keep pace with developments in various modern means of communication, which has prompted the issuance of a new legal framework to keep pace with these developments. Thus, the Egyptian legislator issued a law specific to electronic signatures, devoting Article 1 to defining certain legal terms, including the electronic signature, which it defines as: "An electronic signature: something placed on an electronic document in the form of letters, numbers, symbols, signs, or other, and has a unique character that allows the signatory to be identified and distinguishes him from others .(Bouhamidi)

Referring to the Algerian legislature, we find that, in line with most Arab legislation, it has also attempted to keep pace with the information technology revolution currently experiencing the world. This led it to issue Law 15-08, previously stated, defining it in Article 2 as: "Data in electronic form attached to or logically linked to other electronic data used as a means of authentication".

A review of Law 15-08 on electronic signatures and certification reveals that the legislature did not define what is meant by an electronic signature, but rather indicated that when the signature is electronic, a reliable means of identification must be used to ensure its association with the associated document. It is clear from all the previous definitions given for electronic signatures that there is convergence in the definition given by each individual country, in addition to the fact that there is no comprehensive definition for electronic signatures. This is perhaps due to the rapid development of communication methods, which will consequently lead to the development of definitions.

The Validity of Electronic Signatures

In this changing environment, most countries have moved toward recognizing electronic signatures. This is due to the current reality of reliance on modern communication methods and means, which are not entirely compatible with the concept of a signature in its traditional sense. Under these circumstances, traditional signatures may find no place in the face of the proliferation of electronic information processing systems, which have begun to sweep the world and rely entirely on electronic media. Manual procedures are thus rendered ineffective ‹(Al-Gharib)Algeria, in turn, kept pace with these changes. The issuance of Law 15-08 on Electronic Signatures and Certification was a recognition of this signature.

Undoubtedly, with most governments shifting from a traditional system to an electronic one, which led them to grant electronic signatures a prerequisite for proof in the face of these international and Arab efforts to recognize electronic signatures, Algerian legislators found themselves faced with the need to update their laws to keep pace with these efforts. Thus, Algeria's efforts to adapt legal rules to modern developments in the field of information technology, particularly those related to the use of mechanisms in e-commerce, culminated.

Therefore, if the general principle is the requirement of proof in writing, which is recognized by most legislation, including national legislation, since the principle in civil law is proof in writing, and in commercial law the principle is freedom of proof, while the exception is proof in writing, this contradiction between the principle and the exception in both civil and commercial law, and the question that arises is: To what extent does an electronic signature achieve proof? The answer is that an electronically drawn document is accepted as evidence, just like a paper document, provided that the person issuing it can be legally identified and that it is prepared and stored under conditions that ensure its security.

Thus, while the institution of signature was not the subject of any legal definition by the legislature, the new text gives the signature a functional definition, as stipulated in Article 2 of Law 15-08 above. The signature, necessary to complete a legal document, allows the signatory to be identified and expresses their acceptance of the obligations arising from the said document.

In addition, it indicates the necessity of trusting the means used in electronic signatures when they allow the use of a secure electronic signature until proven otherwise, in accordance with Articles 10 and 11 of the same law.

Here, as previously noted, the national legislature recognizes two types of electronic signatures: a regular electronic signature and a secure electronic signature. The latter is one whose authenticity is attested to by an accredited electronic authentication service provider. This gives a secure electronic signature legal force, making it superior to a regular electronic signature as evidence. Some transactions are excluded from the possibility of being transferred in the form of electronic documents, documents related to personal or real guarantees of a civil or commercial nature that are not subject to the provisions of this law, but rather are subject to the provisions of the Civil Code in accordance with the general rules because they are part of the public order. This is due to the fact that such guarantees often focus on complex and complicated transactions, which requires the presence of the parties in the contract council. (Al-Haija)

Problems in Proving Business Transactions During Operation

In light of the legislative recognition of the validity of written and electronic documents, including electronic notebooks, the judge's role in addressing evidence has diminished, and he no longer has discretionary power over electronic documents. The parties have a positive role in proof, and their will determines the nature of the means of proof.

It is clear from the above that the company contract can only be proven in writing for partners. Since writing is a condition for the formation of the company, it is necessarily necessary to prove it. Regarding partners against third parties, the company may only be proven in writing. In fact, third parties have the right to claim that the company is void and the contract with it is void. However, partners may not claim this voidness against third parties due to the lack of writing, and it only has effect between them from the day one of them requests the voidness in accordance with Article 418, Paragraph 2 of the Civil Code. Proof of the existence of the company may be accepted from third parties by all means, when necessary. (Nouiri)

It is clear from Law No. (04-08) on the conditions for practicing commercial activities mentioned above, which stipulates: "Legal advertisements shall also be included in the national written press or any appropriate medium, at the expense of the legal person." Thus, the company shall publish, at its own expense, what must be published and in the medium it deems appropriate. Therefore, it is necessary to find special means of publication for commercial companies, as well as to search for modern methods to ensure the dissemination of information, and to create newspapers specialized in the field of commercial advertisements instead of daily newspapers, in addition to the possibility of creating a website for commercial companies through which the words of the commercial companies are advertised. It should be noted that the Algerian legislator prohibits electronic certification service providers from collecting personal data unless they explicitly consent. The electronic certification service provider may only collect the personal data necessary to grant and maintain the electronic certification certificate, and may not use this data for other purposes.

The electronic certification service provider also has a preliminary obligation to verify the integrity of the creation data with the signature verification data before granting the electronic certification certificate. The electronic certification service provider may grant one or more certificates to each person who submits an

application, after verifying their identity and, where necessary, verifying their specific characteristics. (Hidaya Bouazza)

Legal Solutions to Avoid the Problem of Proving Digital Businesses

There are several legal solutions to avoid the problems of proving digital business companies, including the following:

A- Establishing the National Authority for the Prevention and Combating of ICT-Related Crimes

The legislator has taken a number of preventive and punitive measures to combat ICT-related crimes. The legislator has established an administrative body tasked with preventing and investigating ICT-related crimes, particularly serious crimes that threaten state security in general or are described as terrorist crimes. In order to uncover the perpetrators of these crimes, the legislator has authorized this body, in cooperation with the judicial police, to establish electronic technical arrangements aimed at intercepting electronic messages or recording personal information.

(Recording personal information conflicts with the sanctity of private life and the confidentiality of private correspondence, especially since these are constitutionally guaranteed. This prompts us to ask how to reconcile the Authority's commitment to preventing crimes related to information and communication technology, particularly those that threaten state security and are described as terrorist and subversive acts, with the sanctity of private life and the confidentiality of correspondence, especially given that these are constitutionally guaranteed rights?

The National Authority for the Prevention and Combating of Crimes Related to Information and Communication Technology was established pursuant to Law No. 09-04 (09-04)The aforementioned law includes special rules for the prevention and combating of crimes related to information and communication technology. According to Article 14, this body is responsible for the following tasks:

-Activating and coordinating operations to prevent and combat crimes related to information and communication technology.

-Assisting judicial authorities and judicial police services in their investigations into crimes related to information and communication technology, including gathering information and conducting judicial expertise.

-Exchanging information with its foreign counterparts to gather all useful data to identify perpetrators of crimes related to information and communication technology and determine their whereabouts .Referring to French law, the company's articles of association allow the Board of Directors to use information technology, through modern technologies, as if they were present, provided that the company using this technology indicates in the minutes of the Board of Directors' meeting. Several legislations were issued during the period of the spread of Covid-19, including what allows the Board of Directors of a joint-stock company to hold a meeting remotely, considering that the quorum has been achieved in the meeting by means of teleconferencing or audio-visual, while respecting the provisions of the Companies Law, and another that facilitates the Board's meeting, even if it is for a specific period.(Karim)

As for the Algerian legislator, by referring to the provisions relating to management, especially the methods of holding general assembly meetings, there was no indication of the permissibility of using modern communication technologies. Thus, the legislator is far from the provisions of companies on information technology, despite its regulation of remote meeting technology and e-mail since the end of the nineties of the last century. Despite the transformations that the national and international economic field has witnessed and the trend towards modernization and digitization, this technology has not been used in the management of companies in Algerian commercial law . (Karim)

Finally, we note that this national body used to enjoy the status of an independent administrative authority, but this was withdrawn due to political circumstances and it was made an administrative body subject to the authority of the Ministry of Defense.

Activating the Principle of Freedom of Evidence

Evidence aims to seek the truth and establish stability in dealings, as it is the surest means upon which individuals rely to protect their rights. A right is worthless if there is no means to prove it when it is disputed. In addition to the individual interest that evidence achieves, it also achieves a general social interest, as it leads to the resolution of disputes, the prevention of malicious claims, and the provision of stability in society. This is confirmed by. (Bakdar)

– It should be noted that Article 333 of the Civil Code explicitly and unambiguously establishes the principle of freedom of proof in commercial matters, stating: "In non-commercial matters, if the value of a legal transaction exceeds 100,000 Algerian dinars or is of unspecified value, evidence of its existence or termination may not be presented by witnesses unless there is a text stipulating otherwise".

– Given all the issues discussed regarding e-commerce companies and the difficulty of writing them in official electronic form, similar to traditional commercial companies, proving them electronically is based on two possibilities. The first is relying on certification certificates through which the company was registered electronically and assigned a specific domain name indicating its existence. The second hypothesis is to apply the general provisions of freedom of commercial proof by proving them by all available legal means. Conclusion:

– We can ultimately conclude that digital commercial companies are not merely a legal or economic concept, but rather a legal reality whose boundaries have been defined and defined in comparative legislation to operate within a stable framework. Consequently, the issue of proving them electronically has become easier, given the availability of all electronic data. This is in contrast to Algerian law, which continues to struggle legislatively in its attempt to embody the provisions of digital commerce in all its aspects, particularly the issue of electronic proof in the field of digital commercial companies, given the lack of electronic formality. Consequently, these companies remain established in a customary manner and their proof is subject to general rules. We can observe the following results:

– -There are no distinct provisions in the field of electronic proof for e-commerce companies in Algerian law.

– -Despite the issuance of some laws dedicated to the electronic establishment of digital commercial companies, it is concluded that commercial companies are exempt due to the lack of electronic documentation. Consequently, the problem of proof arises for digital commercial companies that operate electronically and deal with consumers electronically.

– The validity of an electronic signature in Algeria has the same legal value as a conventional signature, but its implementation in practice remains modest in the transactions of digital commercial enterprises in Algeria.

– Based on the findings presented, the following proposals can be proposed:

– The law regulating the notary profession must be amended to enable notaries to draft the electronic contracts of incorporation of digital commercial enterprises. This will ensure the legal existence of commercial enterprises operating online, facilitating the process of proving and protecting them and their clients.

– An independent body must be established under the supervision of the Ministry of Commerce and the Ministry of Post and Telecommunications to maintain the electronic files of commercial enterprises in their various legal forms. This body will grant electronic authorizations to all parties involved, allowing for confirmation. This will enable the notary drafting the contract to verify the basic data of the company and its

partners in the case of an active electronic company, and to be granted a special code in the case of incorporation.

– Since the Algerian legislator has equated the legal value of regular writing with electronic writing, as well as electronic signatures, it is necessary to amend the provisions of Article 324 bis 1, which imposes formality in some private transactions, including digital commercial companies. We propose that the term "electronic formality" be included, followed by amending the provisions of companies in the Commercial Code.

– Repeal the prohibition stipulated in Article 3 of Law No. 05-18 regulating the provisions of e-commerce, which prohibits transactions that require formal contracts, and introduce the possibility of applying the provisions of e-commerce by introducing electronic formality.

Acknowledgement

The authors extend their sincere gratitude to the Faculty of Law and Political Science at University of El Oued and Tissemsilt University for their academic support and access to legal databases during the preparation of this study. Special thanks are also due to the legal experts and practitioners who contributed valuable insights into the evolving landscape of Algerian digital commerce regulation.

Ethical Considerations

This research was conducted in accordance with established academic ethics and integrity standards. All materials used are properly cited and referenced. No part of this work involves data collection from human or animal subjects. The study adheres to the ethical publishing guidelines of COPE (Committee on Publication Ethics) and complies with principles of transparency, objectivity, and scholarly rigor.

Funding

This research did not receive any specific grant from funding agencies in the public, commercial, or not-for-profit sectors. The study was conducted through the authors' own academic and institutional resources.

Conflict of Interest

The authors declare that there are no conflicts of interest related to the publication of this research. All authors contributed equally to the conception, analysis, and preparation of the manuscript and approved the final version for submission.

Abstract

Tourism is a dynamic economic and cultural sector that plays a pivotal role in enhancing national revenue, fostering cross-cultural understanding, and generating employment opportunities. In Algeria, the growth of this sector has been periodically hindered by security challenges that undermine public confidence and limit foreign investment. This study provides an analytical examination of the criminal protection of tourists within the framework of Algerian law, emphasizing the legal, institutional, and operational mechanisms established to ensure the safety and rights of travelers.

The paper explores the historical emergence of tourism policing in Algeria—dating back to the late 1950s—and situates it within contemporary legislative developments and international norms on the protection of tourists. The discussion extends to the cooperation between the Ministry of Tourism, the Ministry of Interior, and national security institutions in enforcing a comprehensive strategy that includes surveillance systems, specialized training for tourism police units, and coordination with local authorities.

Furthermore, the study identifies how the deterioration of security in the Sahel region and the global rise of terrorism have impacted Algeria's tourism industry, particularly in the Sahara and southern regions. It critically assesses how legislative reforms, public communication strategies, and safety infrastructure have been utilized to restore trust and stimulate sustainable tourism.

Ultimately, the paper argues that effective criminal protection of tourists is not limited to penal sanctions but extends to preventive frameworks rooted in governance, transparency, and inter-sectoral coordination. The establishment of a secure and ethically grounded tourism environment is essential for positioning Algeria as a competitive Mediterranean destination, capable of balancing economic growth with national security imperatives.

1. Introduction

In recent decades, the global tourism sector has become one of the most dynamic and economically significant industries, fostering intercultural exchange, employment generation, and sustainable development. However, this progress has increasingly been challenged by the rise of terrorism and transnational security threats that directly target or indirectly affect tourist destinations. The recent surge in terrorist attacks across the world has underscored the vulnerability of tourism infrastructures, reshaped travelers' behavioral patterns, and intensified international attention on the intersection between tourism, safety, and national security (World Tourism Organization [UNWTO], 2023).

In light of these developments, it is essential to deepen academic and policy-oriented reflections on how tourism-dependent states can transform security challenges into strategic opportunities for enhancing destination image, governance frameworks, and crisis management. As scholars such as Pizam and Mansfeld (2006) have emphasized, safety and security are no longer secondary elements of tourism policy but rather foundational pillars that determine the competitiveness and sustainability of the entire sector.

1.1. The Algerian Context: Challenges and Potential

Algeria occupies a unique position within the Mediterranean and African tourism landscape due to its extensive cultural heritage and vast geographical diversity. Among its most prominent natural assets, the Algerian Sahara stands as one of the largest and most captivating deserts on Earth—a region rich in archaeological, ecological, and cultural resources that possess immense tourism potential. However, persistent instability in the Sahel region and recurrent terrorist activities perpetrated by groups such as Al-Qaeda in the Islamic Maghreb have exerted significant pressure on the national tourism economy. These challenges have not only discouraged international visitors but also disrupted domestic tourism flows, undermining a sector that could otherwise serve as a vital driver of economic diversification and sustainable development.

Terrorism constitutes one of the most severe impediments to tourism development in Algeria. Beyond the immediate threats to human safety, it erodes international trust, generates negative media portrayals, and constrains foreign investment. Consequently, it has become imperative for Algerian policymakers to reinforce the institutional, legislative, and security frameworks governing tourism to restore confidence among both national and foreign stakeholders.

1.2. Institutional Response and the National Tourism Safety Plan

In response to these challenges, the Algerian Ministry of Tourism, in coordination with the Ministry of Interior and national security agencies, has implemented a targeted strategic plan designed to safeguard foreign tourists and revitalize the country's tourism potential. This initiative aligns with the **National Tourism Guidance Plan (Plan Directeur du Tourisme 2030)**, which envisions the modernization of tourism infrastructures, the professionalization of tourism services, and the enhancement of Algeria's image in international markets.

A key pillar of this strategy involves the establishment of the **Tourism Police**, a specialized security unit tasked with ensuring the safety of tourists, protecting archaeological and cultural sites, and maintaining order in high-traffic areas such as airports, ports, and border zones. The Tourism Police initiative, which traces its conceptual origins to the late 1950s, reflects the institutional recognition that tourism development and national security are deeply interlinked.

While several components of the national security plan remain classified for operational reasons, the government has emphasized transparency regarding its overarching objectives—namely, the prevention of criminal activity, the protection of human life, and the preservation of Algeria's cultural patrimony. The program also underscores the importance of inter-agency cooperation, public communication, and the training of specialized personnel capable of responding to emerging threats in real time.

1.3. The Nexus of Security, Image, and Marketing

The sustainability of the tourism industry in Algeria is contingent not only upon effective policing and legal protection but also upon strategic communication and destination marketing. The negative international media coverage surrounding regional instability has often distorted perceptions of Algeria as a high-risk destination. Therefore, the integration of security assurance into marketing and branding strategies is critical. As recent tourism marketing literature suggests (Cohen & Neal, 2019; Kotler et al., 2021), the ability of a destination to project reliability, safety, and hospitality is as influential as its natural or cultural appeal.

Consequently, Algerian tourism authorities have sought to reposition the country's image by highlighting the government's proactive measures to ensure visitor safety, improve infrastructure, and foster intercultural hospitality. In this regard, media cooperation plays a pivotal role in reshaping narratives, promoting transparency, and projecting a positive national image that aligns with global tourism standards.

1.4. The Central Problem

The core question guiding this study can thus be articulated as follows: **What legal, institutional, and security measures are currently being implemented to ensure the protection of tourists in Algeria, and to what extent have these measures contributed to restoring confidence and promoting sustainable tourism marketing?**

Addressing this question requires a multidimensional analysis that bridges criminal law, administrative governance, and tourism management. The forthcoming sections explore Algeria's strategies for ensuring tourism safety and security, examining the legislative frameworks, organizational structures, and marketing mechanisms that underpin the state's approach to protecting its tourism sector from contemporary threats.

2. Measures to Protect Tourists in Algeria

Ensuring the safety and well-being of tourists has become a central concern of public policy in Algeria's contemporary tourism development strategy. The country's approach integrates preventive, legal, and operational frameworks designed to address emerging threats to tourism, ranging from organized crime to terrorism and infrastructural risks. In line with international best practices promoted by the **World Tourism Organization (UNWTO)**, the Algerian government has prioritized institutional reform and capacity building as part of its broader commitment to sustainable tourism development (Sarah J. Ryu.).

2.1. Primary Measures to Protect Tourists

The initial phase of Algeria's national tourism security policy has focused on identifying and overcoming conceptual and managerial pitfalls that have historically undermined the efficiency of tourism protection programs. Among the key challenges to avoid are:

- Addressing security risks in isolation from broader social, political, and economic factors.
- Relying on outdated or reactive security plans without integrating modern preventive approaches.
- Allowing inadequate resource allocation or administrative negligence to result in disproportionate responses.
- Neglecting the critical role of public communication, security awareness, and tourism-oriented media engagement.
- Treating tourism security merely as a bureaucratic obligation rather than as a strategic component of national development.

In response to these challenges, the **General Directorate of Public Security (Direction Générale de la Sûreté Nationale)** issued a directive announcing the establishment of a specialized security task force dedicated exclusively to tourism-related protection. This initiative represents a structural innovation within Algeria's public security system. The newly formed unit is tasked with guaranteeing optimal visitor experiences by coordinating security logistics at airports, ports, and land border crossings; liaising with local authorities to secure tourist routes; responding to visitor concerns; and ensuring the protection of hospitality establishments and tourist sites.

In a statement delivered during a recent national police training session, the Directorate announced the creation of a **"Tourism Security Coordinator"** position within each provincial security directorate. These coordinators, supported by specialized police units, are responsible for devising operational strategies to safeguard both foreign and domestic tourists, establishing rapid-response procedures in the event of security threats, and implementing localized safety measures.

The institutionalization of this structure is overseen by a **central command unit** at the national level, which ensures coherence in the application of security protocols across all provinces. Importantly, the role of the Tourism Security Coordinator extends beyond conventional policing; it also includes preventive diplomacy, inter-agency coordination, and ethical engagement with tourists and local communities.

To professionalize this effort, the first cohort of officers has undergone training at the **National Institute of Criminal Police in Algiers**, where they receive comprehensive instruction in tourism legislation, crisis management, visitor relations, and the ethics of tourism security. The curriculum also emphasizes the protection of archaeological heritage, reflecting Algeria's dual commitment to cultural preservation and sustainable tourism governance.

2.2. Practical Measures to Protect Tourists

The effective implementation of tourism safety measures requires a well-defined strategic framework that balances objectives with available institutional and logistical resources. Algeria's approach to operationalizing this framework involves several key priorities:

- Developing a coherent and adaptable national tourism safety plan.
- Aligning security objectives with economic and human resource capacities.
- Protecting the country's tangible and intangible tourism assets.
- Establishing clear accountability mechanisms for tourism security oversight.
- Considering cross-border dynamics and regional security interactions that influence domestic tourism stability.

A cornerstone of these initiatives is the **Tourism Police (Police Touristique)**—a specialized branch of the national police force created to ensure the security of visitors, protect archaeological and natural heritage, and strengthen inter-sectoral collaboration. Although Algeria currently enjoys relative internal stability, the formation of the Tourism Police serves both a preventive and confidence-building purpose. Its mandate includes maintaining safety across diverse tourism environments, from urban centers and coastal areas to desert and mountain regions.

The government's decision to train an initial group of sixty officers marks a significant milestone in institutionalizing tourism security. This initiative not only addresses the growing complexity of managing tourist inflows but also alleviates the workload of existing security personnel, particularly during high-season periods. Moreover, it symbolizes a shift toward **integrated tourism management**, in which safety, hospitality, and economic development are treated as interconnected policy goals (Rayan Darouich. 1996).

Tourism currently contributes approximately 2% to Algeria's gross domestic product, and the establishment of the Tourism Police is expected to enhance the performance of the sector by promoting diversified forms of tourism—including cultural, wellness, desert, and coastal tourism. According to **Issa Naili**, former Director of Public Security at the General Directorate of National Security, the primary objective of this initiative is to develop a resilient tourism sector capable of supporting economic diversification while simultaneously safeguarding Algeria's historical and cultural heritage from risks of looting and vandalism.

The initiative also incorporates continuous on-ground security operations across key cities, tourist centers, and archaeological areas. These operations include identity verification, vehicle monitoring, and the implementation of controlled-access systems in zones of high touristic concentration. In addition, enhanced surveillance mechanisms ensure 24-hour protection for sites frequently visited by both domestic and foreign tourists. Such measures aim to

create a **secure and welcoming environment**, reinforcing Algeria's reputation as a safe destination in an otherwise volatile regional context.

2.3. Legal Bodies and Institutional Framework for Tourist Protection

The establishment of **specialized legal and institutional bodies** represents the third strategic axis of Algeria's tourism security system. The formation of Tourist Police units forms part of a broader national framework aimed at improving the quality, efficiency, and transparency of public security services. The overarching mission of these units is to safeguard tourists' physical integrity, personal belongings, and overall experience throughout their stay in Algeria.

Following a successful pilot phase in major coastal provinces—where tourism activity intensifies during the summer—the **General Directorate of National Security** has initiated the gradual deployment of Tourism Police units across interior regions. Each provincial unit is composed of police officers trained according to local needs and demographic characteristics. Their work is supervised by senior officers who have undergone specialized training in security management, tourism law, and inter-institutional coordination.

The responsibilities of the Tourism Police are multifaceted, extending well beyond traditional policing duties. They encompass preventive, protective, and service-oriented functions, including:

- Facilitating the transit of foreign visitors through national border points and transportation hubs.
- Providing accurate information, guidance, and logistical assistance to travelers.
- Enhancing Algeria's national image by promoting a climate of safety, professionalism, and hospitality.
- Safeguarding cultural and historical heritage from theft, looting, and vandalism.
- Escorting tourist delegations and ensuring their safety throughout excursions and transfers.
- Managing tourist complaints and resolving conflicts at accommodation facilities, archaeological sites, and public spaces.
- Supporting official delegations and cultural missions during visits to heritage sites.

The deployment of these units is particularly critical in light of the security threats emanating from Algeria's neighboring regions. The rise of transnational terrorist organizations—most notably the **Salafist Group for Preaching and Combat (GSPC)**—in Mali and Mauritania poses significant risks to regional stability. These groups have engaged in kidnapping operations targeting foreign nationals, often to demand ransom or secure the release of detained members. By reinforcing surveillance and cooperation through the Tourism Police, Algeria aims to prevent such incidents within its borders and reassure international partners of its capacity to provide a safe environment for visitors (Marouan El-Soukkar. 1999).

Ultimately, the creation and institutionalization of these specialized bodies reflect Algeria's commitment to positioning tourism security not merely as a reactive mechanism, but as a **proactive, developmental, and rights-based framework**. This orientation situates tourism safety at the intersection of criminal protection, public governance, and cultural diplomacy—key elements for building a resilient and internationally competitive tourism sector.

3. The Role of Political Stability and Media in Establishing Tourism Safety and Security

The relationship between political stability, media discourse, and the perception of safety constitutes a cornerstone of modern tourism development. Empirical research and global experience consistently demonstrate that tourism cannot thrive without a secure and politically stable environment (Hall & O'Sullivan, 1996; Pizam, 1999). Conversely, when a country maintains stability, transparency, and effective governance, tourism flows tend to increase, bringing about higher levels of investment, employment, and cultural exchange. Thus, security and tourism are mutually reinforcing phenomena: the absence of one invariably weakens the other.

A secure political and social climate encourages the expansion of tourism infrastructure, enhances investor confidence, and contributes to the construction of a positive national image. It also facilitates the implementation of consistent tourism policies, which are essential for long-term sectoral growth. In contrast, political unrest, social turbulence, and security crises create uncertainty that discourages both domestic and foreign visitors, undermining the viability of tourism-based economies.

3.1. The Role of Political Stability

Political stability represents one of the fundamental prerequisites for sustainable tourism development. Contrary to the traditional separation between political and economic domains, contemporary scholarship recognizes that politics, economics, and tourism are intrinsically intertwined (Richter, 1983; Hall, 1994). Tourism, while primarily an economic activity, is deeply embedded in social, cultural, and political structures, and its evolution is often shaped by the state's political agenda and international relations.

In this context, the political environment functions as the enabling framework for tourism. Peaceful governance, the rule of law, and institutional continuity create the confidence necessary for both tourists and investors to engage with a destination. Political instability—manifested through armed conflicts, coups d'état, civil unrest, or abrupt policy shifts—has a direct and immediate impact on the tourism economy. Declines in arrivals, cancellations of flights, and warnings from foreign ministries often follow periods of unrest, as witnessed in countries such as Egypt and Tunisia during the early 2010s.

Tourism is also a vital source of foreign currency and a mechanism for international visibility. According to Bouarié (2010), tourism represents the second-largest global export after oil, accounting for more than USD 300 billion annually and nearly one-fourth of total global gross national product. Over the past two decades, global tourism has grown at an average annual rate of 7.1% in visitor numbers and 12.5% in revenues (UNWTO, 2023). Yet, these growth rates are not uniformly distributed; countries facing political or security instability often experience stagnation or regression in their tourism sectors, despite possessing significant natural and cultural resources.

Political stability also exerts a symbolic influence on a destination's international image. The perception of peace, safety, and effective governance reinforces positive travel decisions, while political conflicts, protests, and social upheavals generate a sense of risk that deters potential visitors. As scholars have noted, tourism does not exist independently of politics—it often serves as both a reflection and an instrument of political processes (Burns, 1999; Hall, 2010). Governments can use tourism diplomacy to strengthen international relations, improve national branding, and facilitate cultural dialogue. Consequently, the political dimension of tourism transcends economic boundaries, situating the sector at the intersection of diplomacy, development, and global governance.

For Algeria, maintaining political stability has been a decisive factor in rebuilding its tourism potential following the civil unrest of the 1990s. The state's efforts to consolidate security, reform public institutions, and strengthen the rule of law have significantly contributed to restoring international confidence. Stable governance allows for the systematic implementation of tourism infrastructure projects, supports foreign investment, and enables collaboration with international organizations in heritage conservation and tourism management.

3.2. The Role of Media

The media—both domestic and international—plays a pivotal role in shaping perceptions of security and influencing tourism flows. In the contemporary information age, the concept of *security media* has emerged as a strategic instrument of preventive communication, designed to raise awareness, disseminate accurate information, and foster cooperation between the public and security institutions (Ibrahim, 2018). Security is no longer confined to post-crisis intervention; it increasingly relies on preemptive communication and community participation to deter risks before they materialize.

Security-oriented media serves several essential functions. It enhances public understanding of safety measures, builds trust in law enforcement agencies, and mobilizes societal cooperation in the pursuit of stability. Through

news coverage, documentaries, and dramatizations, media outlets can reinforce responsible civic behavior and highlight the successes of national security initiatives. In turn, this fosters collective vigilance and a shared sense of responsibility among citizens—an indispensable foundation for national stability (Ibrahim Imam. 1975).

Equally significant is the role of *tourism media*, a specialized branch of communication that promotes a nation's attractions, services, and hospitality culture. Tourism media acts as both an educational and promotional tool, guiding domestic and international audiences toward discovering the country's cultural heritage and natural landscapes. Through visual storytelling, advertising campaigns, and digital marketing, it contributes to shaping the destination's identity and appeal (Morgan, Pritchard, & Pride, 2011).

In Algeria, the media's contribution to tourism promotion remains underdeveloped compared to global standards. Although the country has made progress in establishing tourism-oriented communication platforms, foreign media narratives continue to dominate the portrayal of Algeria abroad, often emphasizing regional instability or geopolitical risks. Such coverage distorts the reality of Algeria's safety improvements and natural beauty, creating a gap between perception and reality. This asymmetry underscores the urgent need for **strategic media diplomacy**—a coordinated communication policy involving the Ministry of Tourism, the Ministry of Communication, and private media organizations—to project a balanced and positive image internationally.

Former president of the **National Federation of Local Tourism Offices**, *Mohamed Azzouz*, emphasized that the revitalization of Algeria's tourism image could be achieved within a six-year horizon if stakeholders adopt a unified vision and proactive communication strategy. He argued that tourism promotion should not rest solely on the shoulders of the National Tourism Office or the Ministry of Tourism but must engage regional administrations, private operators, and local communities in a collective national effort.

Similarly, *Mohamed Maazouz* highlighted Algeria's current transition toward recovery and renewal after a decade of stagnation in the tourism sector. The rediscovery of numerous archaeological and natural sites—such as the *Knif Traditional Bath* in Khenchela, recently identified as Africa's first natural thermal bath—illustrates the country's untapped potential. With strategic media coverage and international partnerships, such discoveries could serve as powerful catalysts for repositioning Algeria as a distinctive and secure Mediterranean tourism destination.

In this sense, media and political stability represent **two interdependent pillars** of tourism safety and development. Political stability ensures the structural conditions necessary for tourism to operate, while the media shapes public perception, disseminates trust, and amplifies the state's achievements. Together, they form the communicative and institutional architecture required to promote Algeria as a safe, welcoming, and globally competitive tourism destination.

4. Conclusion

Tourism legislation, particularly the laws and regulations that focus on the protection of tourists, represents a vital pillar in shaping the contemporary framework of sustainable tourism governance in Algeria. These regulations have established transparent mechanisms and accessible procedures designed to encourage both domestic and foreign investment in the tourism sector. They have also facilitated a climate conducive to diversification and economic revitalization, especially in light of the security challenges faced nationally and regionally over the past two decades.

The significance of tourism law lies in its dual function: **protective and regulatory**. On one hand, it safeguards the rights and interests of all stakeholders within the tourism ecosystem—travelers, operators, and institutions alike—by setting out legal norms and responsibilities. On the other hand, it establishes deterrent mechanisms and sanctions to address violations and criminal acts targeting tourists or tourism infrastructure. The existence of such a framework aligns Algeria with the objectives of international organizations such as the **World Tourism Organization (UNWTO)** and the **Arab Tourism Organization**, both of which emphasize the importance of legal uniformity, accountability, and ethical conduct in tourism management.

However, the effectiveness of this legal framework depends largely on its **implementation**—a process that requires continuous coordination between national and local authorities, as well as between the public and private sectors.

Local governance bodies must assume their roles not merely as service providers but as proactive agents of safety, regulation, and promotion. This collective and participatory approach reinforces the shared responsibility of sustaining tourism development as a national priority (El-Hachach, A. 2010).

To achieve tangible results, Algeria must adopt **bold institutional and legislative reforms** that modernize tourism administration and address persistent procedural inefficiencies. Such reforms include the simplification of investment processes, the enhancement of tourism security guarantees, and the mitigation of the negative impacts of recurring travel advisories issued by foreign governments. Furthermore, sustained **political stability** and **constructive media engagement** remain indispensable prerequisites for ensuring security stability and promoting Algeria's image as a safe and welcoming destination.

The establishment of a specialized **Tourism Police**—an initiative rooted in Algeria's historical awareness of its archaeological and cultural wealth—reflects an institutional recognition that tourism safety is not a peripheral issue, but a core component of national security and economic development. The presence of trained officers across the Republic's major archaeological, historical, and natural sites demonstrates the country's commitment to protecting both visitors and its heritage assets. These personnel serve multiple functions: accompanying tourist groups, managing entry and exit procedures, providing assistance and guidance, responding to complaints, conducting inspections, and ensuring compliance with safety and administrative regulations.

Ultimately, the criminal protection of tourists in Algeria reflects a multidimensional effort that integrates **security, law, ethics, and institutional collaboration**. It is a dynamic process that continues to evolve in response to global and domestic challenges, guided by the principle that a secure tourism environment is a prerequisite for economic prosperity, cultural exchange, and the promotion of Algeria's image on the world stage.

5. Results

The findings of this study underscore several critical observations concerning the criminal and administrative protection of tourists in Algeria:

- The **criminal protection of tourists** constitutes a formal responsibility within the broader mandate of the national security apparatus.
- The **presence of visible tourism police units**, while necessary, may inadvertently project an image of insecurity to foreign visitors, highlighting the need for discreet or indirect protection measures.
- There exists a **resource gap** that limits the state's capacity to monitor all tourism activities effectively, particularly in remote regions.
- Given Algeria's vast geographical territory, it remains **impractical to provide comprehensive protection** for all sites simultaneously without enhanced coordination and digital support systems.
- The operational costs associated with maintaining the tourism police may, in certain cases, **exceed the direct revenue** generated by tourism in the protected zones, suggesting the need for strategic optimization.
- The **criminal and legal protection of tourists** intersects closely with the general jurisdiction of the judiciary and law enforcement, requiring better-defined procedural linkages.
- The **integration of tourism protection provisions into Arab national legislations** reflects a regional consensus on the need to safeguard visitors amid prevailing geopolitical instabilities.

These findings collectively affirm that the safety and protection of tourists in Algeria is not solely a matter of law enforcement but rather a systemic challenge requiring balanced policies, technological innovation, and public participation.

6. Recommendations

To reinforce Algeria's framework for criminal and institutional protection of tourists, the following recommendations are proposed:

1. **Develop and institutionalize specialized training and educational programs** for tourism police personnel, integrating modules on intercultural communication, hospitality ethics, and crisis management.
2. **Increase the severity of legal penalties** against individuals or groups that target tourists or commit offenses within tourism facilities.
3. **Establish an ethical and professional code of conduct** governing the behavior of tourism police officers, service providers, and public officials interacting with both domestic and international visitors.
4. **Amend the Penal Code** and related legislation to include explicit provisions addressing crimes against tourists and violations occurring within tourism spaces.
5. **Implement indirect and preventive security measures** (such as surveillance systems and community engagement programs) to minimize the visible militarization of tourist areas.
6. **Integrate cultural and linguistic training** into the preparation of tourism police personnel, ensuring that officers possess both security expertise and comprehensive knowledge of local and international tourism contexts.
7. **Promote a culture of legal awareness among tourists and citizens**, emphasizing respect for regulations, heritage protection, and responsible tourism practices.
8. **Enhance collaboration between the media and tourism authorities** to raise public awareness about tourism safety, promote positive narratives, and counter misinformation.
9. **Encourage cooperation between public and private tourism operators**, requiring both to share responsibility for visitor safety and reduce dependence on state security forces.
10. **Strengthen coordination and strategic planning** among all relevant stakeholders—ministries, local governments, tourism offices, private operators, and civil society—to ensure the alignment of tourism, security, and development policies.

Final Remark

The sustainable development of tourism in Algeria depends not only on its natural and cultural endowments but also on its ability to guarantee **security, justice, and trust**. By integrating criminal protection, political stability, and media diplomacy into a cohesive national strategy, Algeria can transform its tourism sector into a resilient, ethically governed, and globally competitive industry—one that upholds both economic prosperity and human security as complementary objectives.

Acknowledgment

The author expresses sincere appreciation to the **Echahid Cheikh Larbi Tebessi University, Tébessa, Algeria**, for its continuous academic and institutional support in promoting research on tourism security and legal protection. Gratitude is also extended to the **General Directorate of National Security (DGSN)** and the **Ministry of Tourism and Handicrafts of Algeria** for providing access to relevant documents, legal materials, and practical insights into the implementation of the Tourism Police initiative. The author further thanks the reviewers and editorial team of *Science, Education and Innovations in the Context of Modern Problems* for their valuable guidance and constructive comments that helped improve the quality and scholarly rigor of this paper.

Ethical Considerations

This research was conducted in full compliance with academic integrity and ethical research principles. All sources of data and information have been properly cited in accordance with the **American Psychological Association (APA) 7th Edition** referencing style. The study did not involve human participants, personal data collection, or experimental interventions; therefore, no ethical approval was required under the institutional research guidelines of Echahid Cheikh Larbi Tebessi University. The author affirms adherence to the ethical publishing standards of the **Committee on Publication Ethics (COPE)**, ensuring transparency, originality, and academic honesty throughout the research and publication process.

Funding

This research received **no specific grant** from any public, commercial, or not-for-profit funding agency. The study was carried out as part of the author's independent academic work and institutional research responsibilities at **Echahid Cheikh Larbi Tebessi University, Tébessa, Algeria**.

Conflict of Interest

The author declares **no conflict of interest** related to the research, authorship, or publication of this article. The views and conclusions expressed herein are solely those of the author and do not necessarily reflect the official positions of any affiliated institution or governmental body.

Keywords English language teaching; Algerian education; educational policy; teacher perceptions; professional development; modern pedagogical reforms.

Abstract

The present study investigates the practical realities of teaching English in Algerian middle schools in the context of recent educational reforms and evolving policy orientations. The research sample comprised 42 English-language teachers (male and female) selected through a probabilistic random sampling technique from several municipalities within the Wilaya of Relizane. Data were collected using a structured questionnaire designed to examine teachers' perceptions of English-language instruction in relation to the goals and expectations of modern educational policy. After establishing the instrument's validity and reliability, quantitative statistical analyses were performed. The findings revealed that teachers' overall perceptions of the current state of English teaching were moderate, indicating a gap between pedagogical aspirations and classroom realities. Furthermore, the analysis identified statistically significant gender differences in teachers' responses, favoring female participants. Differences were also found based on teaching experience, with more favorable perceptions among teachers possessing less than ten years of service. These results highlight persistent challenges in the implementation of language-education reforms and underscore the need for a comprehensive, flexible policy framework that prioritizes continuous professional development, context-sensitive pedagogy, and the integration of technological and instructional resources. Strengthening alignment between policy intent and classroom practice is essential for enhancing English-language education and supporting teachers in meeting contemporary educational demands.

1- Introduction:

Education is considered one of the most important basic components and indicators against which the progress and development of countries and societies is measured, as the development of the latter is based primarily on

the outcomes of the educational process, whether from people and competencies capable of advancing our societies, or through the material products of science represented by devices and technologies that play an effective role in developing activities and services and thus contributing to the progress of countries (Shehab, 2021, p. 87). To achieve these outcomes with quality and effectiveness, it is necessary to focus on a fundamental component of the educational process: "teaching methods." The latter are a fundamental link between the student and the curriculum components and represent the tool through which educational situations within the classroom are achieved, ensuring genuine interaction between the teacher, student, and content. From this standpoint, the effectiveness and quality of education is inseparable from the effectiveness of teaching methods, which contribute to achieving lesson objectives, organizing content, and stimulating learners' motivation, which enhances opportunities for active learning and takes the student out of the circle of passive reception and into the circle of interaction and participation" (Al-Khatib, 1997, p. 17–18).

In this field, the quality of education is only developed through a teacher with the required professional competence. Interest in the teaching profession from any society stems from the fingerprints that the teacher leaves on his students' behaviors, morals, minds, and personalities. We are undergoing tremendous scientific, technical, and research progress, so we have a strong need for more skills and ways of thinking that the teacher must acquire (Faraj, 2005, p. 7).

Learning foreign languages, especially English, is one of these essential skills, given that it is the language of science, technology, and global communication. This requires teachers to be able not only to teach the language, but also to employ it as a tool for thinking, openness, and interaction with global developments. This makes teacher training in this field a strategic necessity to raise the level of education and keep pace with the challenges of the times.

So, "English is considered the basis of progress and development. It is the most common language, so it must be learned and taught to facilitate communication between different societies and cultures in an era in which the world has become a small village and English has become the dominant language. Knowing it has become a requirement for success in academic or practical life. Accordingly, learning English has become necessary." Due to its dominance in all fields, the number of people wishing to learn it is increasing, and there is no country in the world that does not teach it in its schools and universities and use it with others together. This indicates that the English language has become the undisputed language of the world (Tarhiwa, 2021, p. 174). Despite the growing importance of learning English as the language of science, technology, and international communication, the reality of teaching it still faces several challenges. Numerous previous studies have indicated a low level of student proficiency in this language, both in terms of linguistic proficiency and communicative skills. This has been confirmed by several previous studies that have addressed this topic from various perspectives. Geagea and Bashar's study (2024) indicated that students of English as a Foreign Language, despite having positive attitudes towards intercultural communication, suffer from a lack of self-confidence and a low level of intercultural awareness, which negatively affects their communicative competence. From On the other hand, Fakih's study (2009) revealed the existence of multiple difficulties in learning basic English language skills, represented by students' weakness in spelling and grammar skills, lack of supportive activities, and the absence of modern educational methods, in addition to weak diversity in assessment methods, and the existence of problems related to curricula, teaching methods, and educational administration. In the same context, the study of Al-Obeiki and Al-Saloum (2020) found that the speaking skills of secondary school students were at an average level, reflecting a gap in the acquisition of basic oral skills.

Students are not the only ones who suffer from difficulties in learning the English language, but the matter goes beyond that to include the view of many secondary education teachers themselves towards the curriculum of this subject. Multiple educational studies have shown that some teachers believe that the adopted English language curriculum does not keep pace with the real needs of learners, and does not reflect their aspirations towards learning a living and effective language used in real life, including the study of Al-Muhaimi and Al-Rashidi (2020), which showed that English language teachers face great procedural difficulties in applying continuous oral assessment of listening comprehension skills, related to the student first, then to the educational means, then to the teacher, and finally to the listening content With the absence of clear evaluation mechanisms and a diversity of methods.Fakih's study (2009) also showed that the level of teachers' application of procedures for teaching speaking skills according to the communicative approach in the intermediate stage remains modest, which reflects the weakness of oral and communicative interaction within the departments.

In his local study, Boutaghan (2024) highlighted that teaching English in Algerian schools suffers from structural challenges, the most important of which are the multiplicity of the local linguistic environment, the pressure of academic programs, the absence of modern educational methods, and overcrowding within departments, which hinders the implementation of effective teaching strategies, especially in the primary stage. For its part, the Kahol study (2012) also found that traditional teaching methods are one of the most prominent reasons for poor academic achievement in the English language among middle school students.

In terms of teachers' attitudes and professional training, Qasimi's study (2023) showed that primary school teachers' attitudes towards including the English language are generally positive, which is also confirmed by Harqas' study (2024), which monitored positive attitudes towards training objectives, but negative attitudes towards its content and duration, indicating the need to update training programs. In contrast, the Al-Jaboul study (2014) monitored an average level of awareness among English teachers of their need for professional development, which weakens the effectiveness of their performance in departments.

At the level of specialized language skills, the study of Al-Hoshani and Al-Nusyan (2020) revealed that teachers' beliefs and personal experiences influence methods of teaching writing skills, while the study of Al-Shahri (2021) showed that middle school teachers have positive attitudes towards using the flipped classroom as a modern curriculum in teaching English. Odeh's (2000) study also showed that teachers' attitudes towards teaching English literature are generally positive, but application is influenced by the curricula and strategies adopted.

Finally, Qadi's (2008) study highlighted the average use of modern teaching methods and technologies in teaching English at the intermediate level, noting that there are obstacles that limit their effective integration into daily education.

Based on the researcher's review of educational literature and previous studies related to this topic, it was concluded that there are several factors that affect students' learning of the English language, which overlap with each other and contribute to a low level of linguistic achievement. These factors include poor language proficiency due to a lack of actual practice within the department and the absence of a supportive environment outside the school. Teachers also rely on traditional teaching methods that focus on memorization and translation and neglect the development of communication skills. Limited pedagogical training among teachers and their poor adherence to modern methods of language teaching are also major obstacles. Deficiencies are also recorded in the content of the curriculum, which focuses on grammatical aspects more than practical skills, as well as the lack of modern educational methods and the absence of interactive media. Overcrowding within departments also represents an additional obstacle that limits opportunities for individual practice. On the other hand, students' low motivation and low self-confidence when speaking are observed as a result of the lack of family and community support. The dominance of the mother tongue or local dialects exacerbates the difficulty of using English in daily life, isolating it from lived reality. The combination of these factors explains the recorded weakness in learners' learning of this vital language.

Hence, this research aims to shed light on the reality of teaching English in Algerian schools: between educational policy and contemporary requirements, through a field study from the perspective of middle school teachers. Based on this context, the following questions arise:

1- What is the reality of teaching English in Algerian middle school schools under the current educational policy, and to what extent does this reality respond to the requirements of the times, from the point of view of middle school teachers?

2- Are there differences in the view of male and female professors towards teaching English in educational institutions in the intermediate education stage?

3- Are there any differences in the professors' view of teaching English in educational institutions in the intermediate education stage, according to teaching experience (between those under 10 years old and those 10 years old and above).

✓ **Research hypotheses**: The answers to the questions were as follows:

- The first hypothesis: There is an average level of reality in teaching English in Algerian middle school schools under the current educational policy from the point of view of middle school teachers.

- The second hypothesis: There are differences in the view of male and female professors towards teaching English in educational institutions in the intermediate education stage, and in favor of females.

- The third hypothesis: There are differences in the teachers' view of teaching English in educational institutions in the intermediate education stage, according to teaching experience (between those under 10 years old and those 10 years old and above).

✓ **Research objectives:**

The study seeks to achieve the following objectives:

- Revealing the level of reality of teaching English in Algerian middle school schools, in light of the current educational policy, from the point of view of middle school teachers.

- Identify whether there are statistically significant differences in professors' view of teaching English due to the gender variable (males / females), and determine in favor of which category these differences are.

- Clarify whether there are differences in professors' opinions about teaching English in intermediate-level educational institutions due to professional experience (less than 10 years/10 years and over).

✓ **Importance of research:**

This study gains its importance from its treatment of the reality of teaching English at the intermediate level, as it is a basic language in the era of globalization. Its importance lies in highlighting the factors that hinder students' learning, teachers' perceptions of the challenges they face, and analyzing the extent to which the curriculum is compatible with the requirements of the times. It also contributes to submitting proposals to improve the quality of education, and provides those in charge of the educational system with scientific data that supports the development of educational policies and teacher training.

✓ **Procedural concepts used in the study:**

The research is linked to a set of concepts related to the study variables, which the researcher addresses as follows:

A- Teaching:

The researcher defines it procedurally as: all the activities and practices carried out by the intermediate English language teacher within the classroom, whether in planning lessons, implementing them, using educational tools, interacting with students, or employing language teaching strategies and methods, as perceived and evaluated by the teachers themselves through their response to the items of the questionnaire adopted in this study.

B- English language:

Procedurally, it is: the educational material prescribed in the intermediate stage curriculum in Algerian schools, which aims to develop the four linguistic competencies (listening, speaking, reading, writing) among students. It is also taught by intermediate education teachers, and its reality is evaluated through their opinions and responses to the study questionnaire.

C- Educational policy:

It is procedurally defined as: the set of official directions and plans adopted by the Ministry of National Education in Algeria to organize English language teaching at the intermediate level, including curriculum objectives, program content, evaluation methods, and teacher training

D- Requirements of the era:

It is procedurally defined as: the set of linguistic, technological, and communication skills and competencies imposed by contemporary reality, especially in light of digital transformations and global cultural openness, which require the learner to master the English language as a necessary tool for continuous learning, access to knowledge, and interaction with the world, as middle school teachers perceive it in their assessment of the reality of teaching this language.

- ✓ **Reasons and motivations for choosing a topic for study:**

This topic was chosen based on the researcher's personal interest in the field of teaching and learning foreign languages, particularly English, given its critical importance in the era of globalization and digital literacy, and its pivotal role in supporting communication and scientific and cultural openness. The researcher also noted a relative scarcity of field studies that address the reality of teaching English at the intermediate level from the teachers' perspective, compared to available studies at the primary and secondary levels. This deficiency has provided a scientific impetus to explore this reality more deeply. In addition, the multiple challenges facing English language teaching, whether from the learner, teacher, or curriculum, are among the most significant obstacles affecting the effectiveness of the educational process. This requires a serious scientific study that sheds light on these difficulties and suggests ways to overcome them in line with contemporary requirements and the trends of educational policy in Algeria.

2. Theoretical framework of the study:

1.2. Teaching English (General concepts and foundations):

A- Definition of language:

In his book Language and Society, Dr. Mahmoud Al-Saaran quoted several opinions from scholars from different specializations about the concept of language. We will suffice with pointing out only the most important of them, which are:

1 - Language is the expression of ideas through speech sounds combined into words.

2 - Language is a purely human and completely non-instinctive means of communicating thoughts, emotions and desires through a system of symbols issued voluntarily (Sahrawi, 1998, p. 30).

IbnKhaldun also provides an advanced definition in his introduction, saying: "Language in conventional terms is the speaker's expression of

Its purpose, and that phrase is a linguistic act arising from the intention to benefit speech, must become a decided faculty in its active organ, which is the tongue, and it is in every nation according to their terminology. For him, language has sounds that were said intentionally to indicate meaning, and the tongue is the tool that produces it. In another place, he says, "Language is a faculty in the tongue, and so is calligraphy, the creation of its faculty in the hand" (Okasha, 2006, p. 17).

Based on the aforementioned definitions, the researcher defines language as: Language is a system of phonetic symbols that a person formulates intentionally and willingly to express his thoughts, emotions, and desires. It is a social tool and an acquired faculty in the tongue that is used in communication and understanding within the linguistic group, and its characteristics are determined according to the cultural norms and terminology of each society.

B- Definition of the English language:

English is an international language that is widely spoken in almost all countries of the world. This is due to its use in various fields, such as business and study. It is one of the means of global and diplomatic communication between peoples around the world. English is known as a Western language belonging to the ancient Germanic languages, which developed over time due to the use of many dialects, which contributed to adding a set of new vocabulary and linguistic structures to it. The English language is still developing to this day, and this is due to the continuous development that man faces and the permanent inventions (AbdRabbo, p. 01).

C- The importance of the English language:

English is one of these languages, as it is the world's first language in terms of its use in communication and in various fields such as diplomacy, politics, commerce, technology, academia, and others. To keep pace with the times and learn about the latest developments in various sciences and knowledge, peoples and nations must learn this language. Therefore, many individuals seek to learn the English language greatly, and this has contributed to the specialization of international curricula specifically for the English language. The importance of learning the English language, as stated in (2016, Oxford Royale Academy), is summarized according to the following points:

-Mandarin is classified as the most widely spoken language as a primary language (mother language)only, while English is the most widely spoken language in most public fields.

-English contributes to providing many opportunities for individuals, such as helping them find work. Most job interviews rely on English as a prerequisite for individuals to accept the job they are applying for.

-English is the official language of many types of university fields of study, such as science, medicine, engineering, economics, business administration, and other educational fields that many university students seek to study.

-The English language helps increase the ability to read books, magazines, and research published based on them which supports the development of science, knowledge and personal culture among individuals.

-The English language offers a range of means of communication between different peoples, contributing to the recognition of global folk customs, heritage, and traditions.

-English is widely used on websites on the Internet, as learning it helps individuals learn about the nature of websites and the content published on their various pages (Al-Askari, 2022, pp. 1388-1389).

E - Prospects for teaching English in Algerian schools:

The decision to support Algerian schools with English from the primary stage will raise the educational and cognitive level of students at all levels, because English is the language of the future and the language of development And technology, so Algerian society began to teach and learn it, and welcomed the idea of including it in educational institutions alongside the French language, for a new beginning for the people and the country alike.

Teaching English is an important gain for the educational system in general and the Algerian child in particular, as the English language enables the child to acquire the ability to think in a universal language and to be flexible in solving problems. Acquiring this language enhances the student's self-confidence and facilitates the process of "accessing the sources of knowledge and scientific and technical documentation available in that language, especially information related to automated media." It allows him to access international scientific platforms that rely heavily on English, and helps him deal with computer software and various contemporary technology applications. In addition to all these gains, it cannot be overlooked that teaching the English language serves scientific research in general, as it contributes to expanding the scope of scientific publishing, which has become more dependent on the English language. Publishing in French has recently restricted the researcher and limited his chances of publishing, unlike the English language, which opens up broad horizons for him to publish" (Botghan, 2024, pp. 153-154).

F- Obstacles to learning the English language:

These obstacles can be divided into the following groups:

1- Psychological obstacles: These relate to the nature of the human psyche and include a preconceived view of language and misconceptions about learning a foreign language.

2- Administrative obstacles: lack of money and management

3- Technical obstacles: These include shortcomings in the curriculum and aspects related to the language itself and its differences from the mother tongue.

4-Obstacles to the general educational system: These obstacles are represented in several things, including:

-Lack of clarity of goals for the teacher, learner, and parents.

-The presence of study burdens and extracurricular activities that burden the teacher and limit his role in achieving the set goals.

- Traditional teaching methods that are not in line with the conceptThe nature of contemporary learning (Kahul, 2012, p. 133).

3. Field study procedures:

1.3. Study methodology:

To verify the hypotheses of the current study, the researcher used the descriptive analytical approach, which is based on an accurate description of the reality of teaching English in Algerian schools from the perspective of middle school teachers, and analyzing the dimensions of this reality in light of educational policy and the requirements of the era. It also relies on comparing study variables, such as gender and professional experience, with the aim of revealing potential differences in teachers' perceptions of the reality of teaching and the challenges associated with it.

2.3. Limits of the study:

The field study was conducted in a group of averages in the state of Relizane, and in particular in my district Mazouna and SidiM'hamed Ben Ali in Algeria, and it was implemented during the second semester of the 2024/2025 academic year

3-3 - Study community:

The study community is represented by English language teachers who perform their duties in the intermediate schools in the previously mentioned state.

3-4 - Study sample and specifications:

A random sample of (42) male and female English language professors was selected, distributed over a set of averages across the two districts previously concerned with the state of Relizane, and we summarize their specifications in the following explanatory table according to gender and professional experience as follows:

Table N° (01): the specifications of the study sample

Variables	Experience		Gender	
School Name	(≥ 10 years)	(< 10 years)	(Female)	(Male)

Ahmed Zabana, BeniZentis	1	3	3	1
BelâsselAbdelkader, BeniZentis	2	2	2	2
SadekAbdelwahab, Médiouna	0	3	2	1
Larbi Ben M'hidi, Médiouna	1	2	3	0
BelabbassiAbdelkader, Médiouna	2	1	2	1
BouamoudAbdelkader, Médiouna	1	2	2	1
16 April, SidiM'hamed Ben Ali	3	1	2	2
Khaled Ben AinEsSemmene, S.M.B.A	1	2	2	1
ToumiAbdelkader, AïnMatboul	3	1	2	2
ToumiAbdelkader, El Guettar	2	1	2	1
New Middle School, El Guettar	2	2	2	2
Heni Ben Heni, OuledMeziane	1	3	2	2
Total	**19**	**23**	**26**	**16**

It is clear from Table No. (01) that the number of female English language professors reached 26 professors, which is considered a greater value compared to the number of male English language professors, which reached 16 professors, with a difference of 10 professors from the total members of the study sample as a whole It is also clear that the number of English language professors of both sexes with professional experience of less than 10 years reached 23 female professors (A), which is considered a greater value compared to the number of English language professors of both sexes with professional experience of 10 years and above, which reached 19 female professors (A), with a difference of O4 female professors (A) out of the total members of the study sample as a whole.

3.5. Study tools:

In his study, the researcher relied on a questionnaire regarding middle school teachers' view of the reality of teaching the English language in secondary educational institutions in Algeria. To achieve the objectives of the study and collect more Data, information and facts related to this topic. The researcher built a questionnaire consisting of (44) items, distributed over four dimensions as shown in the following table:

Table N° (02): Research Axes and Their Objectives

N°	Axis	Objective
1	Evaluation of the English curriculum	To evaluate the curriculum in terms of its objectives, content, and suitability for learners.
2	Teacher training and retraining	To assess the teacher's competence and training in teaching English.

3	Evaluation of pedagogicalresources	To examine the tools, support, and educational environment.
4	Obstacles to teaching English	To identify the difficulties teachers face in teaching English.

3-6 - Study tool:

Correction key: always = 3 degrees, sometimes = 2 degrees, rarely = 1 degree.

3-7 - Psychometric properties of the study tool:

A - Honesty: the honesty of the arbitrators

The study tool was presented to seven judges specializing in educational psychology, to express their opinion on the soundness of the linguistic formulation and the extent to which the paragraph is appropriate and belongs to the appropriate dimension. The approval of (86%) was also adopted as evidence of the validity of the tool, so that the questionnaire took its final form and now consists of (40) paragraphs distributed equally over four dimensions.

B - Stability through internal consistency of the dimensions of the scale:

The internal consistency of the scale was calculated by calculating the correlation coefficients between each of the four dimensions of the scale and the total score of the scale as shown in Table No. (02).

Table N° (03): Internal consistency of scale dimensions.

N°	Dimension	Correlation Coefficient	SignificanceLevel
1	Evaluation of the English curriculum	0.56**	0.00
2	Teacher training and retraining	0.48**	0.01
3	Evaluation of pedagogical resources used	0.67**	0.00
4	Obstacles to teaching English	0.52**	0.00

It is clear from Table **N°** (03) that all correlation coefficients between each of the four main dimensions of the scale and the total score of the scale are significant at a significance level of (0.01), and this confirms the internal consistency of the scale.

4.Present and discuss the results:

4-1- Presenting and discussing the results of the first hypothesis:

Which states: There is an average level of reality in teaching English in Algerian middle school schools under the current educational policy from the point of view of middle school teachers.

The arithmetic averages and percentages of the areas of the study tool were extracted, after performing the following calculation: (highest value – lowest value)/3 = (120–40)/3 = 26,66.

From it, the researcher obtains the areas of estimates of the degrees of view of intermediate education professors on the reality of teaching the English language as follows: (40-66.66) low level, (66.61–93.27) intermediate level, (93.27–120) high level. It will be discussed by discussing its partial hypotheses, which are as follows:

Table N° (04): The arithmetic average of the level of view of intermediate education professors regarding the reality of teaching the English language.

Statistical Variables	Sample Size	Mean	Standard Deviation	Level
General hypothesis of the study: Perception of middle school English teachers regarding the reality of English language teaching	N = 42	84.50	3.09	Moderate

It is clear from the table above that the level of view of intermediate education professors regarding the reality of teaching the English language came with a standard deviation of (3.09) and an arithmetic mean of (84.5O), which is limited within the limited average range between (66.61–93.27), and this indicates an average score, which is consistent with the text of the first hypothesis that we expected.

This result is consistent with the results of the study of Faqih (2009), which aimed to explore the level of application of the procedures for teaching the skill of speaking English by fourth-year middle school teachers according to the communicative approach. It asked about the general level of its application, and the results were as follows: The general level of the study sample in the procedures for teaching the skill of speaking is low. The monthly study (2021) also aimed to identify the attitudes of middle school English teachers towards using the flipped classroom in teaching English. The results showed that there are positive trends among middle school English teachers towards using the flipped classroom in teaching English. It was consistent with Al-Jaboul's study (2014), which aimed to determine the level of English language teachers' awareness of their professional development at various educational levels in public schools in Madaba Governorate, as its results showed that the level of English language teachers' awareness at various educational levels of their professional development was moderate in all fields.

It was consistent with the study Qadi (2008), which aimed to know the reality of using educational methods and modern technologies in the intermediate stage to teach the English language; From the point of view of educational supervisors and school principals in Mecca, its results concluded that the degree to which English language teachers use educational methods and modern technologies is average. As well as Odeh's study (Odeh, 2000), which aimed to identify the most important strategies used by English language teachers for the eleventh grade in teaching various literary works. The study also aimed to identify teachers' attitudes towards teaching literature, the impact of teaching literature on students' use of language, and the curriculum often used in teaching various literary works. Its results revealed that teachers' attitudes towards teaching English literature as part of language teaching were mostly positive. As well as the study of Al-Hawshani and Al-Nusyan (2020), which revealed the practices of English language teachers in teaching writing skills at the secondary level in the Qassim region, its results concluded that the positive trend towards the teaching profession led them to search for more creative ways in teaching writing skills. In addition to The Harqas study (2024) aimed to monitor and know the attitudes of English language teachers in the primary stage towards training, as its results concluded that the attitudes of teachers towards training goals were positive, while they contradicted this result with regard to the content of training and the duration of training, as their attitudes were negative, and it also contradicted the Qasimi study (2023) which aimed at the attitudes of primary education teachers towards including the English language in the primary education stage The results showed that professors' attitudes towards including the English language were positive.

This result can be explained by the fact that the level of perception of middle school teachers regarding the reality of teaching the English language was moderate, and did not reach the desired level. This is due to some factors and obstacles, including: Teaching the English language in the middle school stage suffers from several obstacles, the most prominent of which is the lack of clarity in the educational objectives in the curriculum, which

makes it difficult for the teacher to accurately determine the targeted competencies. There is also a lack of pedagogical and technical training, especially with regard to the use of modern methods and interactive teaching methods. Financial capabilities within institutions, such as the absence of audio-visual aids and specialized departments, weaken the quality of learning. The high number of students in the department and the small number of weekly classes allocated to the subject also affect opportunities for interaction and effective practice. In addition to this, students' weak motivation and programs' failure to keep pace with modern requirements, particularly in terms of technology integration and global communication.

4 - 2 - Presentation and discussion of the results of the first sub-hypothesis:

Which states: There are differences in the view of male and female professors towards teaching English in educational institutions in the intermediate education stage, and in favor of females

Arithmetic averages were extracted and (T) was tested to identify the differences between two different groups, and after conducting statistical analysis, the results were reached according to the following table:

Table N° (05): Test results (T) for differences in the perception of male and female teachers towards teaching English in educational institutions in the intermediate education stage.

Variables	Standard Deviation	Degrees of Freedom (df)	T-value (t)	SignificanceLevel (sig)
Males	2.11	40	30.78	0.02
Females	3.12			

From the table above, it was found that the value of (t) is equal to 30.78, and that the arithmetic mean for males was 83.65, and the arithmetic mean for females was 87.43, and the value of the calculated significance level (sig) is equal to 0. 02 is a statistically significant value at $\alpha = 0.05$, and from this it can be said that there are differences in the view of male and female professors towards teaching English in educational institutions in the intermediate education stage, and in favor of females.

This result contradicted Al-Jaboul's study (2014), which aimed to determine the level of English language teachers' awareness of their professional development at various educational levels in public schools in Madaba Governorate, as its results showed that there were no statistically significant differences in the level of English language teachers' awareness of their professional development attributed to the gender variable (teachers). Also with Odeh's study (Odeh, 2000), which aimed to identify the most important strategies used by English language teachers for the eleventh grade in teaching various literary works. Its results found that there were no statistically significant differences in all aspects attributed to the teacher gender variable. In addition to the monthly study (2021), which aimed to identify the trends of English language teachers in the intermediate stage towards using the flipped classroom in teaching the English language. The results showed that there were no statistically significant differences at the significance level of 0.05 or less in the attitudes of middle school English teachers towards using the flipped classroom in teaching English, attributed to the gender variable.

This result can be explained by differences in the perception of male and female teachers towards teaching English in educational institutions in the intermediate education stage, and in favor of females, for several possible reasons, including:

Female teachers show a greater tendency to adhere to courses and implement formal instructions, which makes them more aware of the actual reality of teaching English. They also regularly participate in educational and training activities, which enhances their understanding of the challenges of the subject. They are distinguished by their high pedagogical sense and clear organizational accuracy, which is reflected in their evaluation of curricula and teaching methods. In addition, many of them appreciate the importance of English in the digital age and cultural openness, which makes them more realistic and critical in their observations. While it is noted that males may tend to have a more general outlook, females tend to analyze and detail

4-3- Presentation and discussion of the results of the third hypothesis:

Which states: There are differences in the teachers' view of teaching English in educational institutions in the intermediate education stage, according to teaching experience (between those under 10 years old and those 10 years old and above).

Arithmetic averages were extracted and T was tested to identify differences between two different groups, and after conducting statistical analysis, the results were reached according to the following table:

Table N° (05): Test results (T) for differences in professors' view of teaching English in educational institutions in the intermediate education stage according to the variable of teaching experience.

Variables	Standard Deviation	Degrees of Freedom (df)	T-value (t)	SignificanceLevel (sig)
Less than 10 years of experience	3.11	40	2.31	0.001
10 years of experience or more	2.97			

From the table above, it was found that the value of (T) is equal to 2.31, and that the arithmetic mean among professors with professional experience of less than 10 years was 88.78, while the arithmetic mean among professors with professional experience of 10 years and more was 81.33, and the value of the calculated significance level (SIG) is equal to 0.001, which is a statistically significant value at $\alpha = 0.01$, and from this it can be said that there are differences in the professors' view of teaching English in educational institutions in the intermediate education stage, according to teaching experience, and in favor of those with professional experience from 10 years and above).

This result contradicted the study of Al-Jaboul (2014), which aimed to determine the level of English language teachers' awareness of their professional development at various educational levels in public schools in Madaba Governorate, as its results showed that there were no statistically significant differences in the level of English language teachers' awareness of their professional development due to the variable of years of professional experience. It also contradicted Odeh's study (Odeh, 2000), which aimed to identify the most important strategies used by eleventh-grade English language teachers in teaching various literary works, and its results revealed that there were no statistically significant differences in all aspects attributed to the variable of his years of experience. In addition to the monthly study (2021), which aimed to identify the trends of English language teachers in the intermediate stage towards using the flipped classroom in teaching the English language. The results showed that there were no statistically significant differences at the significance level of 0.05 or less in the attitudes of middle school English teachers towards using the flipped classroom in teaching English, attributed to the number of years of teaching experience.

The researcher attributes this difference in the differences in the professors' view of teaching English in educational institutions in the intermediate education stage, according to the variable of professional teaching experience and in favor of professors with professional experience of less than 10 years, to several possible reasons, including: the tendencies of professors with experience of less than ten years to have a more positive and modern perception of the reality of teaching English, given that they have received modern training in line with new educational trends, And their openness to using digital means in education. They are also highly motivated and enthusiastic about innovation, driven by their desire to prove their professional competence. In contrast, professors with long experience adopt a more conservative or critical view, as a result of the accumulation of field problems and their feeling of dissatisfaction with the pace of development of educational conditions.

5 - General summary:

The study concluded that teaching English at the intermediate level in Algeria still faces several challenges, despite efforts to develop it. The results revealed average perceptions among teachers, reflecting a gap between educational policy and actual implementation. She also explainedthat the current curricula need to be reviewed

to suit the students' level and the requirements of the times. Differences were found related to gender and professional experience, with female professors and those with less experience showing greater openness to modern methods. Poor pedagogical conditions are also a major obstacle. The study recommends the need to review curricula, improve the work environment, and intensify continuous training to advance English education.

6 -Recommendations:

In light of the study results, the researcher recommended the following: supporting teacher training in modern methods and technology, reviewing curricula to suit students' level and contemporary requirements, improving teaching methods and conditions, and motivating Learners with interactive activities, and the adoption of a comprehensive national language policy for teaching foreign languages.

Acknowledgment

The author extends sincere appreciation to the **Education and Development Laboratory** at the **University of Oran 2 Mohamed Ben Ahmed** for providing academic guidance and institutional support throughout this research. Deep gratitude is also expressed to all the **English-language teachers** who participated in the study and generously shared their professional insights and classroom experiences. Their contributions were invaluable in enriching the empirical depth and practical relevance of this research.

Ethical Considerations

This study was conducted in accordance with the **ethical research standards** established by the **University of Oran 2 Mohamed Ben Ahmed** and conforms to the principles of the **Committee on Publication Ethics (COPE)**. Participation in the study was entirely **voluntary**, and all respondents were informed about the purpose and confidentiality of the research. No personal identifiers were collected, and all data were analyzed anonymously. The researcher ensured that participants' rights, privacy, and professional dignity were fully respected throughout all stages of the investigation.

Funding

This research **did not receive any specific grant** from funding agencies in the public, commercial, or not-for-profit sectors. The study was conducted as part of the author's independent academic work at the **University of Oran 2 Mohamed Ben Ahmed**.

Conflict of Interest

The author declares **no conflict of interest** related to the authorship or publication of this article. All analyses, interpretations, and conclusions presented herein reflect the author's independent scholarly work and do not necessarily represent the official views of the affiliated institution.

Keywords Real Exchange Rate; Domestic Savings; ARDL Model; Algeria; Macroeconomic Stability; Exchange Rate Policy

Abstract

The interaction between the real exchange rate and domestic savings constitutes a critical nexus in the formulation of macroeconomic policy, particularly for emerging economies that rely heavily on external financing and exhibit structural vulnerabilities. This study empirically investigates the long- and short-run effects of real exchange rate fluctuations on domestic savings in Algeria over the period 1980–2023. Employing the Autoregressive Distributed Lag (ARDL) bounds testing approach, the analysis aims to uncover both the dynamic causal relationship and the degree of responsiveness of domestic savings to exchange rate volatility, while controlling for other macroeconomic determinants such as GDP per capita, trade balance, and money supply (M2). The econometric results confirm the existence of a statistically significant and stable long-run equilibrium relationship between the real exchange rate and domestic savings. Specifically, real exchange rate depreciation is found to exert a positive and sustained effect on domestic savings in the Algerian economy. This relationship is explained by improved export competitiveness, higher returns in tradable sectors, and increased profitability of productive enterprises, which together stimulate household and institutional savings behavior. In contrast, real appreciation reduces export earnings and discourages saving in favor of consumption. In addition, the findings reveal that GDP per capita and trade balance improvements positively influence domestic savings, while money supply expansion has a long-term negative effect, mainly through inflationary channels and higher marginal propensity to consume. The short-run dynamics, captured through the ARDL error-correction model, indicate partial adjustment of savings to exchange rate shocks, with the speed of convergence estimated at approximately 42% per annum.The study concludes that macroeconomic stability in Algeria requires a prudent and predictable exchange rate policy aligned with coherent fiscal and monetary frameworks. Policymakers are advised to adopt a managed floating exchange regime that sustains competitiveness while preventing excessive volatility. Strengthening the coordination between exchange rate management, inflation control, and financial market deepening is essential for

enhancing domestic savings mobilization, reducing external dependency, and achieving long-term economic resilience.

1- Introduction

Domestic savings, in particular for emerging countries seeking to increase their self-financing capacity, reduce their external debt burden, and reduce their dependence on external sources, are one of the most important financial foundations for investment and long-term economic growth. High savings rates are a key determinant of economic policy stability and efficiency of financial institutions.

Economists have focused more on factors that affect domestic saving rates, such as economic factors such as inflation, interest rates, and national income; demographic factors such as the level of indebtedness; and institutional factors such as political stability and confidence in the banking system. One of the most important of these factors is the real exchange rate, which is considered to be an economic variable with direct or indirect effects on the saving behaviour of institutions and individuals, as it is closely correlated to the price level of imported goods, wages and economic competitiveness.

Questions have been raised as to whether real exchange rate depreciation policies can help to boost domestic savings in view of global economic developments and greater exchange rate flexibility in most economies. According to some hypotheses, devaluation would improve tradable industries, increase trade surpluses, and reduce demand for imports, all of which would have a beneficial effect on saving. Falling purchasing power may also cause households to save to protect themselves against future price uncertainty.

Based on these facts and in order to learn more about the link between domestic savings and the exchange rate, the study provides new information on the Algerian economy, which is highly affected by the imbalances of trade and exchange rates. In view of this, the following question is put to you:

How does the level of domestic savings in Algeria change in response to changes in the real exchange rate?

Hypothesis:
Algeria's domestic saving rate improved due to the depreciation of the real exchange rate. Relevance of the research:

This study is important in that it clarifies two important aspects of Algerian economic policy and how they influence the factors which determine the savings balance analysis. It is essential to develop more effective economic policies to tackle the fiscal and financial deficits.

Study Objective:

The aim of this study is to examine the relationship between real exchange rates and national savings in Algeria over a short period of time, based on theoretical and econometric estimates. This will help to formulate proposals that can guide policymakers to create more sustainable and efficient exchange and saving policies..

2. Theoretical frameworkand Literature Review:

This section includes empirical data derived from relevant international and regional research and an overview of the primary real classifications that have examined the impact of the exchange rate on household saving. It aims to

clarify the links examined in this context, which apply in the Algerian case, and to place the present study in the context of the existing knowledge.

2.1 Theoretical Transmission Mechanisms

Real exchange rates and household saving are linked by a series of mechanisms proposed by economic theory, which often paints a complex picture, depending on structural economic conditions.

2.1.1 The Competitiveness and Sectoral Profitability Channel

Among these studies, the most famous is the Turner Philip (1988) comparison of the US, Japan and Germany. The author examined the impact of savings and investment balances on the current account. The study looked at how governments, businesses, and consumers save and invest, and how these factors are related to real exchange rates, interest rates, and income. The findings showed that real exchange rates have a greater impact on current account volatility than interest rates and that they are inversely correlated to the household saving surplus. These findings add to the literature on global imbalances by comparing the savings-investment-fundamentals strategy with traditional foreign-trade models, where the exchange rate is central. (Turner, 1988)

Gala Paulo and Marcos Rocha (2009) used panel models using gross margin estimates to investigate the relationship between real exchange rates and household saving in several middle-income countries. The findings show that the declining real exchange rate boosts the incomes of export-producing industries, making their products more affordable and competitive on international markets. This will help increase the level of household savings. This allows investments to be made. This shows how the exchange rate can be a reliable tool to support saving and growth. (Gala & Marcos, 2009)

Presser Prereira and Luiz Carlos (2014) examined the relationship between the real exchange rate in Brazil from 1994 to 2013 and both domestic and external savings. The study found that when domestic currency is valued to finance the current account deficit, domestic savings fall, because the estimated profitability of the tradable goods sector declines, discouraging potential investors from investing in the sector. As a result, companies and individuals are forced to reallocate resources to foreign investment or consumption. As a result, domestic savings are being replaced by foreign savings. (Bresser, Luiz, Eliane, & Paulo, 2014)

2.1.2. The Redistribution Channel (Wages vs. Profits)

According to Keynesian literature, domestic saving is influenced by the real exchange rate, which affects wages and earnings as well. In the tradable goods sector, appreciation tends to result in reduced profits while real wages rise, reducing the incentive to save and increasing consumption. On the other hand, depreciation increases profit margins and reduces real wages, which boosts exports and investment and raises incomes, thereby supporting domestic savings growth. In an open economy, a real-exchange-rate depreciation increases exports and reduces consumption as a percentage of output, thereby increasing domestic saving and reducing dependence on foreign savings (Marshall-Lerner condition). The economy is moving towards consumption-led development with a current account deficit and low domestic savings when the currency is overvalued relative to its equilibrium value. (Gala & Marcos, 2009, p. 6)

2.1.3. The Consumption-Smoothing and Precautionary Saving Channel

According to Keynesian literature, domestic saving is influenced by the real exchange rate, which also has the effect of weakening the real exchange rate can reduce the real purchasing power of households by increasing import costs. This may lead to a short-term reduction in savings. But people may save to protect themselves against future income shocks if they believe the depreciation will be permanent, or if economic uncertainty increases (Keynesian stimulus). The relative strength of the effects on substitution and revenues determines the net impact. (Alexander, 1998)

Razmi, Rapetti and Skott (2012) confirm that maintaining a competitive real exchange rate is a key element in achieving long-term economic balance in developing countries. The depreciated real exchange rate helps to channel resources into productive and export sectors, encouraging capital accumulation and an increase in investment rates, rather than inflows of resources, which cause consumption booms and threaten stability at large. This system helps to achieve sustainable household savings and to reduce consumption over-indebtedness. This

explains why many emerging economies, such as China, have succeeded in using a competitive exchange rate as a tool to stimulate both growth and saving. (Razmi, Rapetti, & Skott, 2012, pp. 9-10)

According to the theory of some economists, including Presser Pereira, the appreciation of the local currency to finance the current-account deficit reduces the profitability of the tradable-goods sector, which in turn reduces domestic savings and encourages foreign savings. (Bresser, Luiz, Eliane, & Paulo, 2014)

But other scholars believe that the effect of the real exchange rate on capital accumulation may have an indirect effect on saving. The fall in the real exchange rate could be due to an increase in savings, which are then used to finance investments. This pattern is also evident in countries such as China, South Korea, Malaysia, Thailand, and Chile, which have experienced strong and sustained economic growth, but also falling real exchange rates and high savings rates. Others, such as Mexico before 1995, followed the opposite pattern, with real exchange rates rising and economic growth and savings falling. (Montiel & Luis, 2008, p. 4)

2.1.4 The Monetary and Institutional Channel

In this respect, Helpman and Razin (1984) provide a theoretical framework to explain how the international payments system affects the relationship between the national saving and the exchange rate. While the role of investment is more clearly evident in the currency system of the seller, where saving has an indirect effect through capital accumulation and investment financing, saving is directly determinant of the exchange rate in the currency system of the buyer, through its impact on relative consumption between countries. As a result, the link between household saving and the exchange rate depends on the type of monetary mechanism used in business transactions and is not absolute or linear in nature.

The researchers expressed this mathematically in two simplified forms:

a- In the seller system (S):

$$e_t = \left(\frac{Y_{F,t}}{Y_{H,t}}\right)\left(\frac{M_{H,t}}{M_{F,t}}\right)$$

The exchange rate is linked to the relative money supply (M) and the net investment-linked output (Y). This makes investment the main determinant of exchange rate movements, whereas saving effects are indirectly felt through capital accumulation..

b. In the buyer's system (B):

$$e_t = \left(\frac{C_{F,t-1}}{C_{H,t-1}}\right)\left(\frac{M_{H,t-1}}{M_{F,t-1}}\right)$$

The exchange rate is based on the relative money supply (M) and relative consumption (C), which in turn are influenced by the household savings habits. Here, the exchange rate is directly linked to household savings through relative consumption.

Savings thus directly affect the exchange rate through spending and consumption patterns. The institutional framework and monetary mechanisms governing international trade thus affect the relationship between domestic savings and the exchange rate, which are not absolute and linear.. (Helpman & Razin, 1984)

Study of Senturk and Ali. (2021) , According to the study on the effectiveness of monetary policy channels in emerging countries (Turkey, Russia, Mexico and Chile), the exchange rate channel is an important and diverse aspect of conveying the effects of monetary policy. The findings showed that Turkey has been remarkably effective in this channel, as changes in interest rates have triggered a strong exchange rate reaction, which in turn affects macroeconomic factors, including inflation and investment.

By contrast, in Russia, Mexico, and Chile, the channel was less effective, and the exchange rate response to monetary policy changes was less pronounced. Structural factors, including the type of exchange rate regime in place, the degree of economic openness, and the growth rate of financial markets in each country, are blamed for

the difference. In addition to the general weakness of the interest rate channel observed in all countries surveyed, the study also highlighted the complex relationship between the exchange rate channel and other channels. This relationship shows that in emerging economies, monetary policy effects on exchange rates are not always fully passed on to the real economy.. (Senturk & Ali, 2021)

2.2. Empirical Evidence: A Survey of Conflicting Findings

These theoretical problems are reflected in empirical research that shows that the relationship varies according to the country, time period, and methodology.

2.2.1. Evidence Supporting a Positive Effect of Depreciation

According to numerous studies, real depreciation of the exchange rate encourages savings. Gala & Rocha (2009) found in a panel of middle-income countries that a competitive real exchange rate increased the profitability of export sectors, which in turn increased savings. (Gala & Marcos, 2009). Similar to this one, Razmi and others. (2012) argued that, as the Chinese experience has shown, maintaining a depreciated real exchange rate helps emerging countries avoid consumption bubbles and channel resources to profitable investments, thus promoting sustainable saving. (Razmi, Rapetti, & Skott, 2012)

2.2.2. Evidence Supporting a Negative or Non-Linear Relationship

The relationship between the exchange rate and household saving has also been the subject of much research. The findings of these studies varied according to the statistical techniques used and the sample of countries concerned. Most showed a negative correlation between the exchange rate and domestic saving. One of the best known of these studies is the Turner Prize-winning study by Philip (1988), contrasting the US, Japan and Germany. The author examined investment and saving balances and how they influence the current account. The study looked at savings and investment by households, governments and businesses, and their relationship to income, interest rates and the real exchange rate. The findings show that the real exchange rate is negatively correlated with the domestic savings surplus and that the exchange rate has a more significant impact on current account fluctuations than the interest rate. By linking the savings-investment-equity strategy to traditional foreign-trade models in which the exchange rate is the key driver, these findings add to the body of work on global imbalances. (Turner, 1988)

Chiu Yibin and Chia-Hung (2016) examined the relationship between saving rates and real exchange rates and trade balances in 76 countries from 1975 to 2010. The study used a smoothed step-through regression model (PSTR) with instrumental variables. The investigation revealed a nonlinear association between variables. The findings apply regardless of the income level of the country, and countries with a higher saving rate than 14.8 percent can improve their trade balance by devaluing their currency or increasing their saving rate. (Chiu & Chia-Hung, 2016)

2.2.3. Evidence from Single-Country and Regional Case Studies

Chiu Yibin and Chia-Hung (2016) examined the relationship between saving rates and real exchange rates and trade balances in 76 countries from 1975 to 2010, and found that saving rates and real exchange rates were in line with each other. The study used a step-through smoothed regression model (PSTR) with instrumental variables. The investigation revealed that the variables are non-linear. These findings apply regardless of income levels, and countries with a higher saving rate than 14.8 percent can improve their trade balance by devaluing their currency or increasing their saving rate. (Bresser, Luiz, Eliane, & Paulo, 2014)

Umoru David and Oluwatoyin Tedunihaiye (2023) examined how the volatility of interest rates and the depreciation of the exchange rate affected the aggregate savings of ECOWAS countries. Using the PMG model, the authors concluded that, except for Niger, exchange rate depreciation had a negative impact on overall savings in most of the countries considered. They claimed that the reason for this was the weakness of their export industries. The study also revealed differences in the performance of the savings accounts of the group member countries as a shock absorber of interest rates. (Umoru & Oluwatoyin Dorcas, 2023)

The Elhendawy Omar study (2025) sought to examine the long-term relationship between Egyptian gross domestic savings and the exchange rate over the period 1980-22. A study using a vector error correction model (VECM) found a statistically significant negative relationship between gross domestic savings and the nominal exchange rate,

with savings declining as the Egyptian pound depreciated. The findings also showed that saving and trade conditions are positively correlated, but that fixed capital formation and the current account balance are negatively correlated. The findings underline the need to improve the conditions for trade and exchange rate stability to increase domestic savings in Egypt. (Elhendawy, 2025)

3- Derivation of the Analytical Model

To derive the relationship between the exchange rate and domestic savings, we begin with the aggregate equilibrium condition for an open economy:

Aggregate Supply = Aggregate Demand

$$OT = DT \dots\dots\dots\dots (01)$$

We have:

$$Y = C + I + G + X - M$$

$$Y - C = I + G + X - M \dots\dots \dots\dots (02)$$

We add taxes and transfers to Equation 02, finding:

$$Y - T + R - C = I + G + X - M - T + R \dots\dots\dots (03)$$

Since disposable income is the income plus transfers minus taxes, we obtain:

$$Y_d - C = I + G - T + R + X - M \dots\dots\dots\dots (04)$$

We have: Disposable Income - Consumption = Savings.
By substituting savings into Equation 04 we find:

$$S = I + G - T + R + X - M \dots\dots\dots\dots (05)$$

Given that exports and imports are affected by exchange rate fluctuations, they can be expressed by the following formulas:

$$X = (X_0 + x_1 e)$$

$$M = (M_0 + m_1 Y + m_2 e)$$

Substituting into Equation 05 we get:

$$S = I_0 + G_0 - T_0 + R_0 + (X_0 + x_1 e) - (M_0 + m_1 Y + m_2 e)$$

$$S = I_0 + G_0 - T_0 + R_0 + X_0 + x_1 e - M_0 - m_1 Y - m_2 e$$

$$S = I_0 + G_0 - T_0 + R_0 + X_0 - M_0 - m_1 Y + (x_1 - m_2)e \dots\dots\dots (06)$$

Let $A = I_0 + G_0 - T_0 + R_0 + X_0 - M_0$

Thus, Equation (06) becomes:

$$S = A - m_1 Y + (x_1 - m_2)e \dots\dots (07)$$

Y: Income

C: Consumption

I: Investment

G: Government Spending

S: Savings

e: Exchange Rate (units of domestic currency per unit of foreign currency)

X: Exports

x_1: The marginal effect of the exchange rate on exports (the slope of exports with respect to the exchange rate).

M: Imports

m_1: The marginal propensity to import (the slope of imports with respect to income).

m_2: The marginal effect of the exchange rate on imports (the slope of imports with respect to the exchange rate).

Equation (07) shows the relationship between savings (S) and the exchange rate (e). The nature of this relationship (direct or inverse) depends on the sign of the expression $(x_1 - m_2)$

A. A case of rising exchange rate:

If we take an appreciation exchange rate (e), the value of the currency will appreciate and thus demand for exports will decrease as domestic goods are now more expensive in relation to foreign goods. Conversely, demand for imports will increase as foreign goods are now cheaper in relation to domestic goods. Thus, the marginal propensity to export is negative (x1<0), while the marginal propensity to import is positive (m2>0). Thus, the value (x_1 - m_2) is negative. That is, the exchange rate and savings have an inverse relationship.

b. Case of a depreciating exchange rate:

Given depreciation of the exchange rate (e), the value of currency will decline. Demand for exports will increase because the prices of the domestic goods are lower compared to foreign goods. Demand for imports will decrease because the prices of foreign goods are higher compared to domestic goods. Therefore, the marginal propensity to export is positive (x1>0) and the marginal propensity to import is negative (m2<0). Therefore, the value (x_1 - m_2) is positive. Therefore, the relationship between savings and the exchange rate becomes directly proportional.

4- Empirical Model and Data

To empirically test this relationship, we specify the following long-run logarithmic model:

$$\boldsymbol{LnSAV = \beta\_0 + \beta\_1\, LnRER + \beta\_2\, LnGDPC + \beta\_3\, LnINF + \beta\_4\, LnTB + \beta\_5\, LnM2 + \varepsilon} \dots\dots\dots\dots (\mathbf{01})$$

SAV: Gross domestic savings (% of GDP). Source: World Bank WDI.

RER: Real effective exchange rate index (2010=100). A decrease implies depreciation. Source: Bruegel Institute/Author's calculation. Source: World Bank WDI.

GDPC: GDP per capita (constant LCU). Proxy for income. Source: World Bank WDI.

INF: Inflation, GDP deflator (annual %). Source: World Bank WDI.

TB: Trade balance (% of GDP). Source: World Bank WDI.

M2: Broad money supply (% of GDP). Source: World Bank WDI.

4.1 Statistical Description of Study Variables and Correlation Matrix:

Before beginning to estimate the study model, one must first verify the characteristics of the time series and determine whether they suffer from any standardization problems that might affect the accuracy of the results. Tables (01) and (02) represent the descriptive statistics and correlation matrix for the study variables.

Table No. (01): Statistical description of the study variables

	LNSAV	LNRER	LNGDPC	LNINF	LNTB	LNM2

Observations	44	44	44	44	44	44

Source: Prepared by the researcher based on Eviews12 program

As we see from Table No. (01), the mean domestic saving was 2.62 having a minimum standard deviation of 0.27, with relative stability. However, the real effective exchange rate varied greatly with a standard deviation of 0.52 and a positive slope of 1.08 as represented by the skewness coefficient with intervals of skewness. It is also noted that most of the variables are at or near the normal distribution.

Table No. (02): Correlation matrix for study variables

	LNSAV	LNRER	LNGDPC	LNINF	LNTB	LNM2
LNSAV	1					
LNRER	-0,54121	1				
LNGDPC	0,59434	-0,40374	1			
LNINF	-0,12536	0,06718	-0,52457	1

LNM2	0,57109	-0,87659	0,75262	-0,35311	0,12891	1

Source: Prepared by the researcher based on Eviews12 program

From Table (02), we can see that there is a moderate negative correlation between domestic savings and the real exchange rate, which is -0.54. And a strong positive correlation between domestic savings and the GDP per capita, which is 0.59, the money supply, which is 0.57, and the trade balance, which is 0.67. While for inflation, its correlation was weak and negative, which is -0.12.

4.2 Unit Root Test for Time Series:

Table No. (03): Results of the unit root test for time series using the ADF test

The results of the time series stationarity test, as shown in Table (03), indicate that all the variables are stationary at first difference. With the exception of inflation and per capita GDP, they were stationary at the level. This enables the use of the ARDL model, which requires the variables to be stationary at the level or first difference.

4.3 Estimation of the ARDL Model:

Table No. (04): ARDL model estimation results

Variable	Coefficient	Std. Error	t-Statistic	Prob.*
LNSAV(-1)	0.542327	0.178436	3.039333	0.0103

Source: Prepared by the researcher based on Eviews12 program

The optimal ARDL model was subsequently estimated using the Akaike criterion of four maximum lags. Figure (4.3.3.4.4.4) gives the resulting model. The model was found to have high explanatory power, as the corrected coefficient of determination equaled 0.9915, which means that the independent variables explain 99.15% of the domestic savings variation. The connected probability of the Fisher statistic is less than 5%, indicating the significance of the model as a whole. Additionally, the Durbin-Watson statistic is estimated to be 2.23, which is within an acceptable range. This indicates the absence of autocorrelation in the residuals of the model. To determine the existence of a long-run relationship between the variables in question, a bound test will be carried out to test for cointegration between the variables.

4.4 Bound test:

To confirm the existence of a long-term relationship between the variables, we conducted a boundary test, and the results are shown in Table (5).

Table (5): Boundary test results

F-Bounds Test		Null Hypothesis: No levels relationship		
Test Statistic	Value	Signif.	I(0)	I(1)
		Asymptotic: n=1000		
F-statistic	**9.925637**	10%	2.08	**3**
		5%	2.39	**3.38**
k	5	2.5%	2.7	**3.73**
		1%	3.06	**4.15**
Actual Sample Size	40	Finite Sample: n=40		
		10%	2.306	3.353
		5%	2.734	3.92
		1%	3.657	5.256

Source: Prepared by the researcher based on Eviews12 program

We notice from Table No. (05) that the calculated F value is (9.926) which is greater than the upper critical values at all significance levels. Therefore, we conclude that there exists a joint integration relationship between the explanatory variables and the dependent variable. The long-run model is as shown in the table below:

Table No. (06): Results of estimating long-term coefficients

Variable	Coefficient	Std. Error	t-Statistic	Prob.
LNRER	-0.582063	0.096337	-6.041934	0.0001
LNGDPC	2.427729	0.225891	10.74734	0.0000
LNINF	0.013138	0.019665	0.668094	0.5167
LNTB	0.239907	0.057372	4.181599	0.0013
LNM2	-0.163549	0.035237	-4.641343	0.0006
C	-21.65297	2.087290	-10.37372	0.0000

Source: Prepared by the researcher based on Eviews12 program

From Table No. (06), the long-term equation can be written as follows:

$$\boldsymbol{LnSAV = -21.6530 - 0.5821\ LnRER + 2.4277\ LnGDPC + 0.0131\ LnINF + 0.2399\ LnTB - 0.1635\ LnM2} \quad \ldots\ldots\ldots\ldots (\mathbf{02})$$

4.5 Error Correction Model (ECM) Estimation:

It is indicated from the boundary tests that we do have a long-run relationship, and therefore we estimate the short-run model via the error correction model (ECM) and the findings are shown in the table below:

Table No. (07): ECM Error Correction Model Estimation Results

ECM Regression

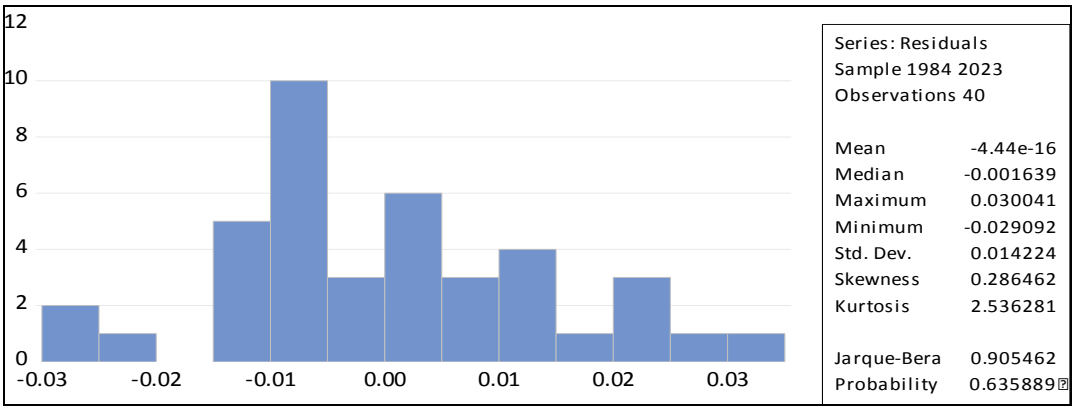
Source: Prepared by the researcher based on Eviews12 program

The error correction model (ECM) was estimated under the ARDL model (4.3.3.4.4.4). The statistical properties goodness of the model was noted. The R2 of 0.989 indicates that 98.9% of the variation in the domestic savings rate is explained by independent variables. The standard deviation of 0.0209 indicates that the model's residuals are weakly scattered. The Durbin-Watson statistic of 2.237 indicates that the residuals of the model do not experience autocorrelation issues. The error correction coefficient (CointEq(-1)) is statistically significant and negative at a significance level lower than 5% and is therefore acceptable. The result verifies a long-run relationship among the domestic savings and the rest of the variables. The coefficient suggests that 96.6% of imbalances are fixed in the following period, indicating an immediate adjustment towards equilibrium.

4.6 Model validity tests:

Figure No. (01): Results of the normal distribution test for residuals



Source: Prepared by the researcher based on Eviews12 program

Checking the normal distribution of the residuals, we get the probability corresponding to the Jarque-Bera statistic to be 0.636, which is more than 5%. Therefore, we conclude that residuals are normally distributed.

Table No. (08): Results of the autocorrelation test between the residuals

Breusch-Godfrey Serial Correlation LM Test: Null hypothesis: No serial correlation at up to 2 lags			
F-statistic	0.661387	Prob. F(2,10)	**0.5373**
Obs*R-squared	4.672968	Prob. Chi-Square(2)	**0.0967**

Source: Prepared by the researcher based on Eviews12 program

The result of the LM test was that the probability of Fisher's F statistic is estimated to be 0.5373 and Chi-Square is estimated to be 0.0967, both of which are greater than 5%; hence, we conclude that the model does not possess the problem of autocorrelation between the residuals.

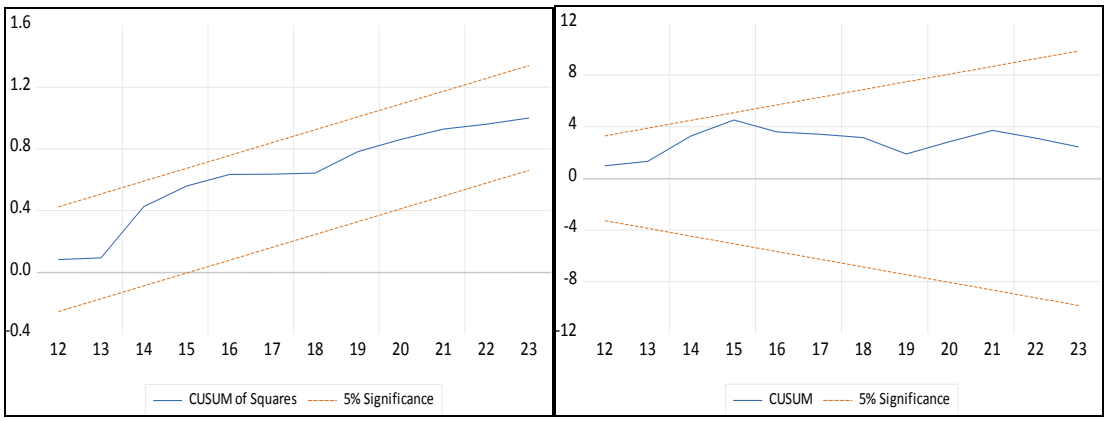
Table No. (09): Results of the variance stability test

Heteroskedasticity Test: Breusch-Pagan-Godfrey Null hypothesis: Homoskedasticity			
F-statistic	0.968178	Prob. F(27,12)	**0.5511**
Obs*R-squared	27.41505	Prob. Chi-Square(27)	**0.4416**
Scaled explained SS	1.895275	Prob. Chi-Square(27)	**1.0000**

Source: Prepared by the researcher based on Eviews12 program

The result of the heteroskedasticity test reveals that the corresponding probability but based on Fisher's statistic and Chi-Square are estimated to be 0.5511 and 0.4416, respectively, which is greater than 5%; hence, we can say that the model is free from variance invariance problem.

Figure No. (02): Results of the cumulative sum of residuals test, and the cumulative sum square of residuals



Source: Prepared by the researcher based on Eviews12 program

To determine the stability of the ARDL model coefficients during the study, both the cusum and cusum of squares tests were employed. Both tests indicated that the graph was within the 5% confidence interval. This means that the model's coefficients are structurally stable over time, and there is no sign of sudden or gradual change in the model's structure over the period of the study. Therefore, the model's estimates can be relied upon to provide a sensible economic interpretation in both the short and the long term.

4.7 Interpretation of results:

1-With an impact of -0.582, the real exchange rate has a negative and significant long-term impact on household saving; a one-percent depreciation of the domestic currency leads to a saving increase of around 0.58 percent. At the first order of magnitude, a short-term negative effect of -0,311 was found. This is explained by the fact that the falling exchange rate makes domestically exported goods more competitive, thus increasing the income and profits of the manufacturing sector. As a result, individuals and institutions can be encouraged to save rather than spend.

2-Over time, GDP per head has a significant and positive effect on household saving. A 1 percent increase in per capita income boosts household saving by about 2.42 percent, according to the 2.427 impact factor. Economic theory, which views savings as a function of income, is consistent with this. The impact was erratic in the short term; the coefficient was significant and positive at 0.786 in the first meeting, but it became negative in the second meeting. This shows the unpredictable savings response to shocks or changes in consumer spending.

3- In the long run, inflation has had little effect, indicating that there is no consistent price-savings relationship. In the short run, the coefficient of -0.0160 showed how inflation, at least temporarily, can destroy people's ability to save, as it reduces the purchasing power of money and encourages consumption rather than saving.

4-Trade balance showed a significant positive long-term impact with a coefficient of 0.239. As it reflects both an increase in foreign-exchange inflows and an evolution of productive capacity, it shows that any improvement in the trade balance (increase in exports or decline in imports) will lead to a large domestic saving. The assumption that trade balances generate excess funds that support domestic savings in the short run was confirmed by the coefficient of 0.349 for the first difference.

5- In the long run, the money supply had a negative and large impact, with a coefficient of -0.1635. This means that a 1 percent increase in the money supply will result in a savings decline of about 0.16 percent. This is explained by higher consumption or inflation due to the growth of money. Conversely, the short-term effect was positive during this period, at 0.349, with a peak of 0.630. This means that the availability of liquidity temporarily supports saving, before its effects are offset by changes in prices or consumption habits.

5. Conclusion and Policy Implications

The purpose of the study was to measure the impact of real exchange rate fluctuations on the savings rate in Algeria over the period (1980-2023) using an automatic distributed error model (ARDM). The results showed that the real exchange rate and domestic savings are negatively correlated in the short and long term. This means that

the depreciation of the Algerian dinar has been responsible for raising the level of domestic savings, increasing demand for domestic production and reducing demand for foreign production. The findings thus demonstrate the validity of the hypothesis that the real exchange rate depreciation will lead to higher domestic savings levels in Algeria.

The study provides empirical evidence for policymakers to consider a more stable exchange rate policy and to link it to structural reforms that support domestic savings, as this is a key element for financing investment and raising economic growth. Research also contributes to the depth of the local economic literature by providing insight into the dynamic relationship between macroeconomic variables and saving, thus improving the effectiveness of economic policies in the context of financial instability. From what we found.

Policy Recommendations:

- Increased confidence in the banking and financial system by providing better real returns on savings and encouraging saving to be used for productive investment.
- Adoption of exchange rate stability and inflation control policies.
- Diversification of sources of national income and reduced dependency on hydrocarbons to support the trade balance.
- Controlling the supply of money and directing monetary growth into investment rather than consumption.

The authors express their sincere appreciation to the **University of Ain Temouchent** and the **University Mustapha Stambouli of Mascara** for their academic and institutional support in the completion of this research. Special thanks are also extended to the **Bank of Algeria**, the **National Office of Statistics**, and the **Ministry of Finance** for providing access to the macroeconomic data used in this study. The authors gratefully acknowledge the constructive feedback and valuable suggestions provided by anonymous reviewers and the editorial board of *Science, Education and Innovations in the Context of Modern Problems*, which significantly improved the quality of this paper.

This research **did not receive any specific grant** from funding agencies in the public, commercial, or not-for-profit sectors. The study was conducted as part of the authors' independent academic work within their respective universities.

The authors declare that they have **no known competing financial interests or personal relationships** that could have appeared to influence the work reported in this paper. Keywords Configurational Poem; Narrative Poetics; Mahmoud Darwish; Visual Imagination; Intergeneric Dialogue; Modern Arabic Poetry; Symbolism of Color; Palestinian Identity; Aesthetic Modernity; Lyric-Narrative Convergence

Abstract
This paper undertakes a critical re-examination of the narrative and configurational poetics in Mahmoud Darwish's long poem Mural, a work that exemplifies the convergence of lyricism, narrative, and visual imagination. The study explores how Darwish's poetic discourse embodies a multilayered field of signification, where aesthetic form becomes a site of resistance, memory, and metaphysical contemplation. Through the interplay between the lyrical self and narrative fragments, Mural constructs an intricate web of voices that disrupts traditional poetic boundaries. The poem's fluidity reveals a modernist vision where fragmentation and dialogism express existential tensions between life and death, identity and exile, presence and absence. By employing a configurational approach, this research interprets Darwish's poetic text as an evolving visual and narrative canvas. The study investigates the symbolic and chromatic dimensions—particularly the recurrence of the color green—as metaphors of renewal and spiritual transcendence within the Palestinian struggle. Moreover, the paper analyzes Mural as a transgeneric artwork that merges painting, music, and theater within its poetic syntax, thereby transforming Darwish's text into a dynamic field of interartistic communication. Ultimately, the study situates Mural within the broader context of modern Arabic poetics, emphasizing its aesthetic innovation and cultural depth as an emblem of the Palestinian consciousness and its enduring defiance against Zionist oppression.

1. Introduction

In Mahmoud Darwish's *Mural*, we encounter a distinctive literary practice that embodies the spirit of modernity in Arabic poetry. The poem transcends the limitations of conventional genre boundaries by weaving together dramatic,

epic, and visual-plastic modes of expression. One of the defining features of this evolution in literary art is the gradual dissolution of the rigid barriers that traditionally separated genres, thereby facilitating the migration of artistic techniques from one domain to another.

Darwish's linguistic configuration in *Mural* penetrates deeply into the poetic body, destabilizing its pattern and giving rise to a complex network of voices and narrative fragments. Through this transformation, the poem evolves into a dynamic structure where dialogue, dramatic tension, and the poetic voice merge in a fluid interplay of meaning. The polyphonic nature of *Mural*—with its scattering of dialogues and secondary figures—adds dramatic density to the lyrical landscape, foregrounding the dialectics between creation and mortality, exile and belonging, silence and articulation.

This study unfolds across three interrelated axes. The first part examines the **configurational poem**, a concept that illuminates the aesthetic convergence between painting and poetry. The second part interprets the **symbolic and chromatic dimensions** of color—especially the omnipresent "green" that symbolizes rebirth and divine vitality within the Palestinian consciousness. The third part explores the **narrative configuration** of the poem and its representation of the struggle between life and death through the metaphors of earth and clay, revealing Darwish's lyrical inscription of the homeland in both existential and artistic terms.

2. The Configurational Poem

The concept of *configuration*, with its multilayered theoretical implications, constitutes one of the essential components in shaping literary discourse. No critical study can fully grasp the power of poetic language without delving into this dimension of form and meaning. Configuration serves as a field for observing and analyzing how artistic language achieves aesthetic effectiveness through interaction with other expressive systems.

The interweaving of poetry and visual art in Darwish's *Mural* gives rise to a new aesthetic paradigm grounded in the imaginative reconstruction of perception. In this way, new writing becomes simultaneously poetic, narrative, and theatrical, incorporating techniques from painting, music, sculpture, and cinema. This interartistic openness reveals Darwish's persistent drive toward modernity—his refusal to be confined by the representational and his aspiration to make poetry a living canvas of visual and emotional resonance.

As critics such as Park (drawing on Baudelaire) have argued, poetry and painting share a visual impulse, uniting the speaking word and the silent image. Darwish's *Mural* embodies this union through its vivid imagery, symbolic chromaticism, and rhythmic structure. The poem thus becomes a painted mural of existential vision—an inscription of the Palestinian experience through narrative rhythm, symbolic color, and spiritual transcendence.

Ethical Considerations

This study adheres to the principles of academic integrity and ethical scholarship. All sources cited have been properly acknowledged, and the interpretations presented are original and grounded in scholarly methodology. No human or animal subjects were involved in this research.

The Chromatic Poetics of White and Red in Mahmoud Darwish's *Mural*

The colour **white** in Mahmoud Darwish's *Mural* constitutes not merely a visual or aesthetic element, but a **distinctive psychological and ontological mood**, one that interacts profoundly with the poem's linguistic fabric. Darwish demonstrates an acute awareness of the **keys to visual perception**, mobilising creative sensibility as a vehicle through which colour transcends mere chromatic value to embody the psychic tension, spiritual anxiety, and suppressed desire that haunt the poetic self.

"...And I fly. I shall be that which I shall become
in the final orbit.
Moreover, all is white,
the sea suspended from the ceiling of a white cloud.
Moreover, nothingness is white in the absolute white sky.
I was, and I was not. Alone am I
in the precincts of this white eternity. I came before my appointed hour,
yet not a single angel appeared to me to say:
'What have you done there, in the world?'
Nor did I hear the cries of the righteous, nor
the groans of the sinners. Alone am I in whiteness,
alone am I..."

This passage reveals how **whiteness dissolves the opaque layers** enshrouding the poem's language. It becomes a chromatic field of *psychic transfiguration*, expressing the self's passage through death as an act of transcendence and voluntary surrender. White, in Darwish's symbolic lexicon, is not a neutral or innocent hue. It **embodies terror and metaphysical awe**, a trembling before the abyss of self-awareness. Whiteness expands not through radiance that excludes all colour, but through its **ambiguity and negation**—its capacity to evoke both **presence and absence**, **light and void**.

Darwish's poetic universe thus situates white as an **absolute field of being**, encompassing the colours of air, sky, and sea, all suspended in an ethereal cosmological rhythm. The poet transforms this chromatic neutrality into an expressive fabric for existential questioning. In this context, white becomes a **spiritual texture**, a mirror of the soul's lacerations, associated with death, shroud, and the infinite silence of the divine. As a **visual metaphor**, whiteness embodies absence—the "visible invisibility" that contains all potentialities of colour. It is both the sum and the negation of all hues, a paradox that produces what Gaston Bachelard termed *le silence lumineux*—a luminous silence brimming with meaning.

Philosophically, if we consider the speculative reflections of natural philosophers, **all earthly pigments appear as deceptive artifices**, mere masks imposed upon the true nature of matter. Within this symbolic logic, white emerges as the **pure origin of light**, the **source of all chromatic existence** and the *ultimate spiritual principle* through which the self seeks its final illumination.

"Whence does poeticity arise?
From the intelligence of the heart, or from the instinct of humankind?
From the instinct of sensing the unknown? Or from a red rose
in the desert? Neither is the personal mine,
Nor is the universal mine.
Poeticity dwells in the white darkness of linen.
I did not know entirely who I was within us or who my dream was.
I am my dream,
as if I were, and as if I were not."

Within these verses, the **"white darkness of linen"** becomes a metaphor for poetic genesis—a threshold where meaning is both concealed and revealed. Poeticity, in Darwish's vision, resides in the **paradoxical space between illumination and obscurity**, between the purity of vision and the fragility of human mortality.

The poem's chromatic trajectory then **shifts from white to red**, marking a new phase of emotional and existential intensity. The **colour red** detonates a surge of metaphysical interrogation. It evokes life, blood, desire, and rebellion—the pulse of vitality against the stillness of death. Red, in this sense, operates as both **eros and thanatos**, a site of collision between creation and dissolution. It propels the reader into a sensorial realm where Darwish explores the recesses of human consciousness and the **psychic sedimentations** of exile and resistance.

This transition from white to red symbolises a **movement from transcendental silence to embodied passion**. The crimson hue, sovereign among colours, bears within it the rose of pride and pain—an emblem of the poet's wandering spirit in the desert of memory. "For red," Darwish suggests, "permeates the soul with its force, the colour of life, of every pulse and anxiety, the very blood of fervour, tumult, and violence." The poetics of diction in *Mural* fuses with the **radiance of crimson**, where emotional saturation meets symbolic density.

Here, the **crimson light merges with the yellows of desert sands**, an image of impermanence where the rose blooms, withers, and sinks into oblivion. Through this chromatic symphony, Darwish celebrates the *mute eloquence* of colour—the way suggestion and silence, hue and emotion, converge into one expressive act. The red in *Mural* thus becomes a language of revelation and concealment, translating anguish into form and silence into vision.

In this interplay between the white of eternity and the red of passion, Darwish constructs a **poetic ontology of colour**, where light and darkness, life and death, are no longer opposites but **mutually reflective conditions** of being. Through this aesthetic synthesis, painting and poetry merge into one field of transcendence. As Darwish himself declared,

"Painting liberates us from the noise of expression into silence."

In this liberation lies the essence of *Mural*—a work that surpasses linguistic confinement, transforming poetry into a **visual metaphysics**, a mural of life, death, and the eternal return of light.

The Poetics of Green and the Narrative Configuration in Mahmoud Darwish's *Mural*

"Green, the land of my poem is green, lofty ...
I record it slowly, slowly,
to the rhythm of seagulls in the Book of Water, I write it,
bequeathing it to those who ask: for whom do we sing
When does salinity scatter in the dew?"

The **chromatic presence of green** permeates the pictorial expanse of *Mural*, unfolding as a dominant resonance that integrates the symbolic, emotional, and spiritual registers of Darwish's poetic vision. Distilled from the blending of **yellow and blue**, green encapsulates both terrestrial fertility and celestial vastness. Through this **chromatic orchestration**, Darwish configures a poetic space that stretches upward toward luminous heights, charged with affective energy and natural rhythm. The freshness of this tone, suspended between earth and sky, evokes both **continuity and renewal**, positioning the poem as a landscape where **language, colour, and rhythm converge** in aesthetic unity.

Within this vast visual field, Darwish weaves a dialogue between **poetry and painting**, where the craft of metaphor becomes inseparable from the migration of meaning across linguistic and pictorial registers. The *Mural* thus evolves as an **inter-artistic discourse**, in which the painter's brush and the poet's pen collaborate to capture semiotic fragments of the human and the divine. The **language of pigments, colours, and forms** becomes a new syntax, one through which the image achieves sensual and intellectual integration.

The utterance of *Mural* arises from the **fusion of inscription and depiction**—the written word and the painted gesture. This interplay of **colour's heat and language's rhythm** generates a movement between the *self* and the *non-self*, between the tangible and the abstract. In this fusion, **green functions as the emblem of peace, openness, and endurance**. Its cool luminosity resists the blaze of destruction, suggesting the persistence of life amid the ashes of war. Darwish situates green within the "Book of Water," the fluid register of origins, posing a metaphysical question: *does water possess colour?* His reflection implies that water, like poetic language, **absorbs the hues of its surroundings**, reflecting multiplicity without altering its essential purity.

"Its appearance differs according to the vessel containing it, the soil beneath it, and that which reflects upon it... water has no inherent colour; it assumes the hue of what surrounds and reflects upon it... for one sees the sea black, yet when scooping a handful, finds it as clear as shallow water."

This reflection on water mirrors Darwish's **poetic epistemology**, where meaning, like colour, is contingent and relational. *Mural* thus becomes a field of luminous interaction in which the visible world and linguistic imagination coalesce. The green of the poem—"the land of my poem is green"—is not merely descriptive but ontological: it embodies the vitality of Palestine, a **symbolic homeland of memory and resurrection**.

Green, as the poet declares elsewhere, is written "upon the prose of the ears of wheat," inscribed into the cyclical temporality of sowing, decay, and rebirth:

"Green I write it upon the prose of the ears of wheat,
the book of the field, arched by a pallid fullness
within it and within me... I am the grain of wheat
that died to turn green again. And in my death lies a life."

This recurrence of green signifies the **rhythmic pulse of regeneration**, intertwining **lyrical tone and musical resonance**. In *Mural*, colour and sound move in synchrony toward the truth of existence, the **crater of being**, where the Palestinian subject affirms identity through continuity and renewal. The poem's fragmentation and self-dispersal transform into eternal echoes of fertility emanating from the green earth—a metaphor for both the **land and the poem** as indestructible repositories of life.

Darwish's creative synthesis echoes the classical dictum that *"painting is silent poetry, and poetry is invisible painting."* Both arts imitate nature not through replication but through **moral and emotional intensification**, attaining a transcendence that fuses perception and imagination. Colour, in this sense, becomes a **thinking art**—a vehicle for consciousness itself. Darwish's sensitivity to colour reflects his belief in its **existential potency**, as it carries the density of signifiers and embodies the **aesthetic manifestation of being**.

Throughout history, colour has fascinated humanity for its capacity to mediate between **sensation and meaning**. In *Mural*, chromatic expression deepens the emotional field of the text, transforming the accumulated pain of **Palestinian memory** into a palette of resistance, hope, and remembrance. The poem's "green" therefore operates simultaneously as **a natural, spiritual, and political signifier**—a chromatic metaphor of homeland and immortality. Within Islamic culture, as Darwish subtly invokes, green also symbolises **paradise and sanctity**; the shrines of saints draped in green embody eternal life "in gardens beneath which rivers flow."

Darwish's mastery lies in the **fusion of poetic rhythm with chromatic harmony**. Through rhyme, cadence, and repetition, he sketches the **dialogue between the spoken and the unspoken**, where sound and colour resonate to articulate the ineffable. This luminous aesthetic energy, rising through the verses of *Mural*, transforms the poetic act into an act of **spiritual resistance** against the occupation that stripped him of his homeland—the very *"green land of his poem."*

The fusion of the **pen's opacity and colour's transparency** gives rise to a unique *chromatic poetics*, in which word and pigment compose figurative rhymes. These rhymes, as Darwish suggests, "echo and complement one another, generating harmony through affinity of shape, space, and symbol." Through such resonance, the poet constructs a **visual-musical symphony**, an aesthetic bridge uniting the **majesty of painting** and the **grandeur of poetry** within a shared search for truth.

The Poetics of Narrative Configuration

In *Mural*, the **poetic field expands beyond lyricism** to embrace **narrative mechanisms**, through which Darwish reconfigures the spatial and temporal dimensions of verse. Poetry becomes a **hybrid art**, a site where visual, musical, and narrative energies converge. The incorporation of dialogue, monologue, and fragmented storytelling **breaches the structural boundaries of poetic discourse**, enabling a dynamic interplay between **figuration and narration**.

The inclusion of narrative discourse serves multiple aesthetic and ideological functions. It reflects the poet's **stance toward reality**, allowing him to reimagine experience through the **syntax of temporality and sequence**. Darwish employs narrative techniques—**characterisation, event progression, and spatial delineation**—not to construct a story but to **intensify poetic revelation**. These narrative incursions, found throughout his oeuvre in works such as *Sarhan Drinking Coffee in the Cafeteria*, *What Was Will Be*, *Ahmad al-Za'tar*, and *The Land*, reaffirm his ongoing attempt to reconcile **the lyrical "I" with the collective "we"**.

Thus, *Mural* emerges as a **narrative poem of self-and-nation**, where colour, sound, and voice intertwine to configure a **poetics of memory and transformation**. The poem becomes both **a mural of existence** and **a testimony of being**, where Darwish's aesthetic innovation mirrors the perpetual struggle of the Palestinian consciousness—its yearning for wholeness amid fragmentation, for harmony amid exile.

The Narrative Green: Lyrical Movement and Fragmented Time in Mahmoud Darwish's *Mural*

"Green, the land of my poem is green,
carried by the singers from time to time, as it is in its fertility.
From it, I have: the contemplation of a narcissus in the water of its image;
from it, I have the clarity of shadows in synonyms;
and from it I have: the resemblance in the words of the prophets
upon the surfaces of the night."

In this lyrical passage, Darwish configures the **radiance of the green poem** as a sculptural vision—an edifice of renewal that breathes through the cosmic vastness of sky and air. The *green* here assumes both a **material and metaphysical presence**, sculpted from the continuity of nature yet animated by the language of transcendence. Its texture is tender yet eternal, carried "by the singers from time to time," a symbol of **collective endurance**. Green glimmers across darkness as "a sudden shimmer upon a black cloud illuminated by the sun," affirming an aesthetic of **hope and regeneration amid ruin**. The narcissus flower—floating in the reflective water—embodies harmony, while "the clarity of shadows in synonyms" evokes the *musical symmetry* between the seen and the said, between poetic diction and its echo.

Darwish's *Mural* thus collapses the boundaries between **lyric and narrative**, achieving what may be termed a *configurational unity*. The lyrical movement fuses with narrative sequences in a fluid continuum—at times so intertwined that distinction becomes impossible, at others separating momentarily to reveal their dialogic duality. This **alternation of fusion and separation** articulates the poet's intentionality: meaning arises through tension, through a dynamic background that resists the stability of fixed interpretation. As Bakhtin's notion of dialogism suggests, such *polyphonic layering* complicates the trajectory of discourse, defying objectivity and closure.

Fragmentation and the Polyphony of Voices

"I saw my French doctor
open my cell and strike me with a cane.
I saw my father returning
from pilgrimage, unconscious,

stricken by a Hijazi sunstroke.
Put me out!..."

"I saw René Char sitting with Heidegger;
The dialogue was a ray."

These fragmentary visions constitute **cinematic flashes** within the text's narrative field, moments of revelation scattered across a landscape of broken memory. *Mural* operates as a **linguistic migration**, employing techniques of rupture, omission, and fragmentation that dissolve traditional narrative linearity. The story flows "like a river from which broken passages pour," moving beyond causality and sequence to evoke a **spiral temporality**—a whirlpool of overlapping scenes, images, and voices.

The poem's **primary narrative**—the existential dialectic of *life and death*—multiplies into numerous subnarratives, producing a mosaic of reflections that mirror the fractured consciousness of the poet. The result is what may be described as a *centrifugal narrative structure*: events and characters emerge and vanish, appearing as spectral fragments, "flashes resembling cinematic shots within a continuously running but incomplete filmstrip." The text advances without resolution; its **movement is ceaseless but non-teleological**, mirroring the **condition of exile and incompleteness** that defines the Palestinian experience and the human condition at large.

Temporal Dissolution and the Hallucinatory Narrative

The **semantic reservoir** of these narrative fragments accumulates around the fertile symbol of *Mural* itself—a repository of moist memories and fluid meanings. Between the *living present* and the *pliant past*, Darwish constructs a shifting field where **time dissolves and reality bends** into dreamlike distortions. The narrative becomes **hallucinatory**, unbound by logic or chronology. Two threads intertwine within this field: one external, linked to **spatial displacement** and worldly experience; the other internal, resounding within **consciousness** as metaphysical reverie.

Through this interplay, Darwish liberates the narrative from realism, reorienting it toward **imaginary and spiritual dimensions** where meaning is constructed according to desire rather than law. The poetic voice thus traverses the boundaries of the self, oscillating between **material imprisonment and metaphysical freedom**. In this sense, *Mural* anticipates postmodern narrative aesthetics, where **fragmentation, multiplicity, and discontinuity** become strategies of self-articulation in the face of existential uncertainty.

The Lyrical Narrative as Human Testament

Darwish employs **lyrical narration** to confront the **crisis of contemporary humanity**, the loss of meaning amid perpetual conflict. The scattered impressions, voices, and glimpses within *Mural*—though seemingly disparate—are **meticulously interwoven** into a coherent aesthetic design. Beneath their surface diversity lies an architectural unity, sustained by the rhythm of repetition and the gravitational pull of the poet's vision.

"I saw al-Maʿarrī expelling his critics from his poem:
I am not blind to see what you see,
for insight is a light leading
to nothingness... or madness."

In invoking classical voices such as **Abū al-ʿAlāʾ al-Maʿarrī**, Darwish situates his poem within the continuum of **Arab intellectual history**, transforming personal suffering into a universal dialogue on the nature of insight, mortality, and artistic truth. Similarly, in another passage:

"I saw lands embracing me with morning hands:
be worthy of the scent of bread. Be
fit with the flowers of the pavement,
for your mother's oven still burns,
and the greeting is warm as fresh bread!"

The imagery of bread, earth, and maternal warmth collapses the distance between **homeland and body**, **memory and survival**. Through such narrative moments, Darwish articulates a **poetics of return**, where the act of writing itself becomes a ritual of resurrection.

Death as Dialogue and Revelation

Mural unfolds as a **dialogue with death**, not as negation but as continuity. Death becomes a **character**, a listener, and a companion—a mirror to the poet's meditation on existence.

"Oh, death, wait for me outside the earth,
Wait for me in your land until I finish
a passing conversation with what remains of life
near your tent; wait for me until I finish existence."

This conversation with death signifies the **culmination of Darwish's existential poetics**, a synthesis of faith and rebellion, despair and affirmation. The poet's allusion to Ṭarfah ibn al-ʿAbd and existentialist thinkers such as Heidegger underscores his intellectual hybridity: the ancient Arabic ode and modern European philosophy converge within the same discursive space. The poet stands at the threshold between **pre-Islamic fatalism and modern metaphysical anxiety**, transforming both into aesthetic meditation.

The **autobiographical resonance** of this dialogue is unmistakable. Composed after his cardiac surgery, *Mural* is both an **elegy and an act of defiance**. Between anaesthetic delirium and creative lucidity, Darwish reclaims authorship over his mortality. The blank page becomes a **metaphysical canvas**—a white space that absorbs pain and converts it into fertility. Through writing, he bestows life upon the "dense earth," transforming his physical suffering into an **epic of beauty and endurance**.

His language migrates toward the **repositories of nature**, drawing from the inexhaustible sources of **philosophical, mystical, and poetic contemplation**. The poem becomes a sanctuary where **death is aestheticised**, a spiritual phenomenon through which the poet contemplates the possibility of eternal renewal. The reader, in traversing this configurational landscape, perceives not merely a personal confession but a **universal meditation on existence**.

Darwish's *Mural* thus stands as an **aesthetic testament of modern Arabic poetics**—a work where the lyrical and narrative, the visual and metaphysical, the historical and existential, all converge into one profound act of creation. The poem does not end in death but **in the breath of meaning**, a resurrection through language that transcends the limits of body and time.

The Metaphysics of Death and Rebirth in Darwish's *Mural*

The climactic scenes of *Mural* reach a transcendent synthesis where death and life no longer stand as opposites but as **interdependent movements within the cosmic order**. To convey the significance of this existential moment, Darwish entreats death to **grant him the majesty of final awareness**, to postpone annihilation long enough for him to complete the act of poetic articulation. Death becomes a **dialogical interlocutor**, not an enemy but a partner in the creative voyage: a "sea voyage aboard a ship" through the turbulence of being.

The poet imagines himself **sailing through the storm**, accompanied by the cries of the dead and the fragile flutter of a bird beneath the tempestuous sky. The flood that drowns the ship evokes not only catastrophe but also **purification**—a symbolic immersion through which the self attains renewal. The survivors who "swim away in the sea as if defying death" embody the poet's faith in **art as resurrection**. The scene is reconstructed as a process of **metamorphosis and fusion**: the human subject, rooted in the "scent of the ancient earth," confronts both the horror and the sublimity of extinction. This confrontation yields a new metaphysical insight—the **resurrection of annihilation**, wherein existence reveals itself as continuity within transformation.

At the centre of this cosmic vision stands **Palestine**, both *origin and telos*, the axis upon which life, death, and memory converge. It is the **sacred geography of rebirth**, "a tale recited upon the wings of the cosmos," where the truth of existence refuses concealment in tombs. In this philosophical frame, Darwish's invocation—"*My hope in you, O death, is to make a truce in your land...*"—illustrates a profound dialectic: a **truce with mortality** that paradoxically affirms life. Here, Darwish reconciles **the metaphysical with the political**, merging existential freedom with national destiny.

For Darwish, **existence equals freedom**, and freedom signifies the **realisation of possibility**. The poet's self-consciousness becomes an *act of choice*, an assertion of individuality amid historical erasure. In this sense, freedom is not mere resistance but an **ontological awakening**, the awareness of the self as both finite and infinite—"belonging to and embodiment of the 'I' in its individual form as consciousness and intention."

The Classical Elements and the Semiotics of Being

The triad of **fire, water, and earth**—three of the four primordial elements of pre-Socratic philosophy—serves as the **metaphorical foundation of Darwish's cosmology**. Each element functions as a **semiotic node**, generating rhythm, symbol, and meaning within the text's architecture. These natural elements, recurrent throughout *Mural*, construct a **poetic ecology** in which life and death interpenetrate, as they have since the earliest mythopoetic imaginings of humankind.

In this schema, **fire** becomes the flame of consciousness and passion; **water**, the medium of purification and transformation; **earth**, the embodiment of origin and permanence. The poet's invocation—*"You have been defeated, death, by all the arts"*—transforms these substances into **signifiers of transcendence**. Through "the clay of humanity," Darwish asserts the **creative victory of art over mortality**: a continuity that defies decay through the permanence of inscription.

"You have been defeated, death, by the songs in the land of the Two Rivers,
by the Egyptian obelisk, the tomb of the pharaohs,
The inscriptions on the stones of a temple have defeated you
Moreover, they have triumphed, and immortality has escaped from their traps."

Here, Darwish reclaims the legacy of ancient civilizations, integrating Mesopotamian, Egyptian, and Palestinian memory into a single **continuum of human creativity**. Through art, inscription, and monumentality, humankind transcends the contingency of death. The *Mural* becomes both an **epitaph and a resurrection**, an aesthetic defiance of oblivion.

The recurrent imagery of **clay, stone, and temple** crystallises into an **iconic image of Palestine**: a land both wounded and sacred, whose soil retains the trace of divine breath. The ascending rhythm of the language, embroidered with fragments of invocation and resistance, transforms the earth itself into a **scriptural medium**. This ascending structure intensifies the **"stimulation of signifiers"**, affirming fragmentation as an act of creative rebellion—a "meteor-like eruption" that disperses images across the page, producing a mosaic of sanctity and pain.

Longing, Transcendence, and the Aesthetics of Danger

Through the echo of "*You have been defeated*," Darwish's text articulates a **chorus of voices** rising from the genetic depths of the earth. Death, paradoxically, becomes an impetus for **human transcendence**, calling upon humankind to "exert effort to transcend its natural condition." This effort is expressed through *longing*—the desire for **adventure, heroism, and love**, all of which carry the risk of destruction.

In *Mural*, **the encounter with death becomes an aesthetic adventure**, a dangerous passage through which the poet redefines greatness as *the courage to imagine beyond mortality*. The danger inherent in facing death transforms into the very condition of artistic creation. Thus, Darwish's longing is both **erotic and ontological**—a yearning for beauty that coincides with a yearning for freedom, the essence of being itself.

Conclusion: Toward a Poetics of Configuration and Freedom

This research has sought to illuminate the **interrelation between poetry, narrative art, and visual imagination** in Mahmoud Darwish's *Mural*. The poem functions as a **hybrid aesthetic structure**, where lyrical intensity converges with narrative progression, and visual imagery merges with philosophical meditation. Through this interweaving, Darwish constructs a **poetics of configuration**—a mode in which painting, music, and storytelling coexist as manifestations of one creative consciousness.

The findings of this study reveal that Darwish's work operates on multiple levels—**semiotic, aesthetic, and metaphysical**—each reinforcing the other in a unified artistic vision:

1. The **integration of visual art** within the poem reflects Darwish's cosmic discourse, addressing the existential condition of the Palestinian subject, whose erasure is resisted through **aesthetic multiplicity and polyphony**.
2. The **fusion of poetic and narrative modes** reveals a complex semiotic architecture that transforms meaning through rhythm, fragmentation, and recurrence.
3. The **lyrical "I" dissolves** into a narrative consciousness that transcends the personal, speaking instead from a collective memory inscribed in the language of exile and return.
4. The **migration of painting into the architecture of poetry** represents a distinctly modernist strategy that contracts time and expands spatial imagination, situating *Mural* within the aesthetics of global modernism.
5. The **dialogical interplay of colour**, particularly the symbolism of white, red, and green, exposes the emotional and philosophical depth of the self, reflecting Darwish's engagement with the **visual grammar of modern art**.
6. The **dialectical experience of life and death**, dramatized through narrative form and chromatic imagery, transforms suffering into an instrument of revelation and meaning.
7. The **poetic language itself** becomes a pictorial act—a brushstroke of consciousness that merges the symbolic with the material, the local with the universal.
8. The **text's open temporality** invites the reader to participate in its completion, transforming interpretation into a creative act of co-authorship.

Ultimately, *Mural* emerges as **a philosophical epic of existence**, an open text inscribed upon the threshold between mortality and immortality, history and dream, matter and spirit. Through a luminous interplay of word and image, Darwish transforms the inevitability of death into an affirmation of life's aesthetic permanence.

In this way, *Mural* achieves what may be called the **freedom of poetic being**—a liberation through art that transcends the boundaries of nation, body, and time. Darwish's final poem thus stands not as an elegy but as an **eternal mural of human consciousness**, painted upon the sky of language, where the poet continues to live, to breathe, and to sing beyond the reach of silence.

Acknowledgment

The author expresses deep gratitude to the Faculty of Arabic Literature at Emir Abdelkader University of Islamic Sciences for its academic support and to colleagues who offered valuable insights during the preparation of this study. The author also acknowledges the inspiring legacy of Mahmoud Darwish, whose poetic vision continues to enrich global literary discourse.

Funding

This research received **no specific grant** from any funding agency in the public, commercial, or not-for-profit sectors.

Conflict of Interest

The author declares **no conflict of interest** related to this publication.

Keywords Poetic repetition; whispering poetry; phonosemantics; sound symbolism; Hanin Omar; Arabic women's poetry; inner rhythm; phonetic structure; emotional resonance; modern Arabic poetics

Abstract

This study explores the aesthetic and semiotic function of repetition in the poetry of Hanin Omar, focusing on its role in shaping emotional resonance and internal musicality through what may be termed poetic whispering. By integrating phonetic, semantic, and affective approaches, the research demonstrates that repetition in Omar's work—particularly of whispered consonants such as /h/, /t/, /f/, and /n/—constructs a delicate yet persistent rhythm that mirrors states of loss, longing, and introspection. Through close reading and quantitative phonosemantic analysis of the collections Bāb al-Jannah and Sirr al-Ghajar, the study reveals how repetition operates as a self-resonant structure: it produces not only formal beauty but also a psychology of echo, where emotion is subtly refracted through sound. The repetition of lexemes and syntactic units further contributes to the architecture of affect, translating silence into speech and transforming whisper into revelation. Thus, Omar's poetic discourse exemplifies how repetition transcends ornamentation to become a dynamic force of expression, rhythm, and meaning in contemporary women's Arabic poetry.

Introduction:

Repetition constitutes a fundamental stylistic element within poetic structure, given its direct influence on rhythm formation, meaning condensation, and the generation of affective energy within the text. This phenomenon has long attracted the attention of critics and rhetoricians. However, modern poetry—especially in its female

expressions—has reconfigured repetition within a new aesthetic framework, based on phonetic and emotional deviation, and on the cultivation of internal confession and whispering language that implies rather than declares, conceals rather than exposes. In this context, repetition functions as both a phonetic and semantic tool to construct an intimate poetic world characterized by delicacy, fragmentation, and ambiguity, particularly when it relies on soft whispered sounds conveying the tremors and psychological and existential tension of the self.

From this perspective, this study arises from the question of how repetition is utilized in Hanin Omar's poetry to construct a whispering poetic language that conveys female emotional experiences and situates the self within the text, establishing an eloquence rooted in restraint, echoing, and measured resurgence. Does repetition in this poetic experience serve merely a decorative phonetic role, or does it constitute a semantic structure revealing psychological tension, existential transformation, and profound emotions? How does the phonetic structure (especially whispered sounds) relate to the affective-semantic dimension of the text? And how can this repetition be read through a modern critical lens that transcends form to reach the depth of the poetic self?

The significance of this study lies in its attempt to combine phonetic approaches with semantic analysis, through a critical reading based on selected examples from the collections *Bab al-Jannah* and *Sir al-Ghajar*, with the aim of uncovering the rhythmic, psychological, and aesthetic functions of repetition, and its relation to "poetic whispering" as an artistic strategy connected to the female experience and spaces of hidden and repressed expression.

1. Repetition and the Implications of Poetic Whispering:

1.1 Reciprocal Effects on Deep Affectivity:

When repetition emphasizes a specific emotional affect (and the condition for this type of repetition is that it appears within a highly emotional context, sometimes reaching a tragic level, so the repeated phrase amplifies the emotional intensity of the poem), (Al-Malaika, 1967) whispering imparts a sense of subtlety, softness, and calm, endowing the emotion with complete impact because it is presented indirectly. The reader senses the intimacy, veil, and poetic concealment of these emotions, which possess their own particularity and resist full disclosure.

1.1.1 Repetition of the Letter:

In phonetics, a letter is categorized into two main types: consonants and vowels. The consonant (Consonne) is distinguished by multiple features and linguistic functions, contributing to the structure of words and sentences through its repetition or distribution within a phrase. Its place and position within the context determine a distinctive functional role. Moreover, the repetition of a consonant or its proximity to other consonants creates an auditory rhythm that may vary between harmony and dissonance, forming a distinctive rhythmic image in the listener's mind. (Tabrmasin, 2003)

In modern poetry, consonant repetition is not arbitrary; rather, it reflects the poet's psychological state as mirrored in the structure of the poem. Studying these letters and their repetition requires statistical methodologies based on quantitative analysis and linguistic comparisons to identify specific patterns, rather than relying solely on visual text analysis. Hearing, as a sensitive perceptual tool, plays a crucial role in eliciting affective responses from the audience, making the effect and rhythm of repeated letters essential for perceiving the aesthetics of poetic texts and their psychological and rhythmic impact. (Tabrmasin, 2003) This is what we attempt to examine and explore through the poetry of Hanin Omar.

Whispered Sounds and Voiced Sounds: Affective Implications in Hanin Omar's Poetry

1- Whispered Sounds: Calmness and Ambiguity

Whispered sounds (such as "s," "sh," "f," "th") are characterized by their softness, producing no vibration in the vocal cords. This feature associates them with ambiguity, calmness, and affective states expressing reflection, sadness, or estrangement. In poetry, the use of these sounds may signify:

- **Inner Calm:** Whispered sounds reflect a quiet or subdued psychological state, making them ideal for depicting scenes of introspection or meditation. When the poet expresses solitude, sorrow, or self-exploration, whispered sounds provide a gentle, flowing rhythm to the text.
- **Ambiguity and Uncertainty:** Repetition of whispered sounds can create a sense of mystery or doubt. When the poet wishes to convey psychological confusion or uncertainty, these sounds effectively evoke haziness and obscurity.
- **Softness and Delicacy:** At times, these sounds indicate tenderness, especially in verses conveying love or subtle emotions. The soft articulation of the whispered consonant conveys warmth and fluidity.

2- Voiced Sounds: Strength and Conflict:

Voiced sounds produce vibration in the vocal cords and are inherently strong and distinct, conveying meanings very different from whispered sounds:

- **Power and Courage:** Voiced sounds are often used to express strength or resilience. In poetry addressing themes such as resistance, inner strength, or challenge, these sounds enhance the perception of power and determination.
- **Movement and Conflict:** When the poet wishes to depict dynamic or tense scenes, such as struggle or confrontation, voiced sounds increase intensity and excitement. Using these sounds in specific positions can make the reader feel the momentum of action or collision.
- **Clarity and Emphasis:** Voiced sounds lend a clear and direct tone to the text. When the poet aims to convey a concept or message strongly and explicitly, these sounds enhance clarity and amplify impact.

1- Repetition of the Letter L (Lam):

Examining Hanin Omar's poetry through the lens of repetition and whispering, we find in her poem *Al-Hālimūn Bilā Amal Wal-Āmilūn Bilā Ḥulm* (Dreamers Without Hope and Those Who Hope Without a Dream): (Omar, 2003)

"Al-Hālimūn Bilā Amal
Like (a woman :
An anthem fell upon her lips, and she sang
And poured poems to the sky
They did not inform her that she
In the midst of the melody, was lost from a string
They did not inform her that she
Was killed by beauty when adorned
Those features of hymnatic weeping
Crucified in her grief like the Magdalene
A torn heart that expanded in the vastness!"

Whispering: *(Do not dream!!!)*

The letter **Lam** appears 84 times in this poem, creating dramatic patterns that express sorrow, grief, loss, and the beauty doomed to vanish.

The line *"Al-Hālimūn Bilā Amal"* opens with a tragic portrayal of dreamers without hope. The L in *Al-Hālimūn* and *Bilā* establishes repetition highlighting the continuity of dreaming without resolution, evoking a sense of endless wandering. The dreamers "without hope" traverse an infinite loop, adding an underlying, subtle, whispered melancholy.

In *"Like a woman: an anthem fell upon her lips and she sang"*, Omar likens the dreamers to a singing woman, emphasizing the continuity of action through verbs *fell* and *sang*. The whispered "t" (Tāʾ) creates a soft murmur, suggesting these actions occurred quietly or suddenly, reflecting abrupt emotional rupture, as if singing results from a hidden, involuntary state of grief.

"And poured poems to the sky" continues with a whispered expression through *poured*, denoting a quiet internal confession or subtle acknowledgment. The repetition of L in *poems* and *sky* links poetic creation to enduring spiritual hope.

In *"They did not inform her that she was killed by beauty when adorned"*, the L in *informed*, *killed*, *beauty*, and *adorned* reinforces the rhythm and conveys continuous warning or foreboding. The notion that the woman was "killed by beauty" suggests that beauty, usually a blessing, turns into a curse. Here, Lam audibly reconstructs the tragic event: the woman adorned herself yet met her downfall through the very beauty she sought.

In *"Those features of hymnatic weeping"*, the L in *features* and *weeping* conveys inner, whispered emotion. These features are not merely external; they carry profound internal grief. Hymns of weeping suggest ongoing "sorrowful rituals" within her being.

"Crucified in her grief like the Magdalene" uses Lam in *crucified* and *Magdalene* to evoke submission and internal torment, likening the woman to Mary Magdalene, a literary symbol of penitence and suffering. The Lam in *crucified* signals a static, inescapable grief, akin to the permanence of the cross.

Thus, **Lam and whispering** play a crucial role in conveying the poet-woman's emotions. Lam, through persistent repetition, symbolizes continuity and fluidity in life, though painfully marked by loss and wandering. Whispering adds subtlety and mystery, expressing suppressed emotions and hidden events. This interplay between **Lam and whispering** reflects the poet's journey from *dreaming* to *loss* to *destruction*, as if trapped in an unescapable cycle

2. Repetition of the Letter Tāʾ (T):

The letter **T** recurs prominently in Hanin Omar's poem *Kam Tushbihuka al-Qasāʾid al-Qadīmah* ("How Much the Ancient Poems Resemble You"): (Omar, 2003, p. 30)

"Qad: the poem resembles me
It flows over my fingers
And two adventurous streams drip from me
Of the pearls of memory
And from a love that merged in amber eyes
Threads of light
I hang in them
Between me and the ultimate
My soul that...
Goes to it and does not return
It transforms me with its departure into a jasmine garden in love
And I become a small bird fleeing from the cage of the horizon
Roses of tenderness grow on my lips
The dew-adorned body decomposes"

In this piece, the repetition of **T** is evident, imparting a sense of softness and whispering. T is not merely a repeated sound but a structural element enhancing the poem's overall atmosphere.

In the line *"Qad: the poem resembles me"*, T repeats in *tushbihuni* ("resembles me") and *al-qasāʾid* ("the poem"), expressing the identification between the poet and the poem. T in *tushbihuni* reflects the poet's self-reflection and integration into the poem, functioning as a whispered sound, suggesting an internal, quiet, and intimate dialogue between the poet and her words.

In *"It flows over my fingers"*, T in *taḥāl* ("it flows") describes the gentle, continuous movement, conveying the smoothness and serenity of the poem as it takes shape over the poet's fingers. This whisper-like articulation emphasizes calmness and contemplation in the text.

In *"And two adventurous streams drip"*, T in *tasyīl* ("drip") repeats, enhancing the sense of continuous flow. This whispering T conveys the fluidity of movement, creating internal musicality and harmony between the poet and nature, as her thoughts and emotions flow like "two adventurous streams."

In *"My soul that goes to it and does not return"*, T in *tamḍī* ("goes") and *taʿūd* ("returns") expresses the ongoing movement of the soul. Whispered T here evokes departure and absence, describing a soul's path with inevitable, serene finality.

In *"It transforms me with its departure into a jasmine garden in love"*, T in *taḥīlnī* ("it transforms me") and *bustān* ("garden") reflects the poet's transformation into something new and beautiful. T conveys change, while *bustān* emphasizes beauty and purity after transformation. The repetition of T here imparts clarity, continuity, and quiet metamorphosis, giving the poem a sense of simplicity and serenity.

In *"Roses of tenderness grow on my lips"*, T in *tanmū* ("grow") and *shafṭay* ("my lips") reflects growth and flourishing, connecting lips with roses and tenderness. The repeated T contributes to the softness of expression, enhancing the intimacy of the poem and reinforcing poetic whispering.

In *"The dew-adorned body decomposes"*, T in *yataḥallal* ("decomposes") conveys transformation and dissolution into the surrounding world, emphasizing the transition from the physical body to spiritual purity, embodying gentleness. This decomposition is portrayed not as painful but as a quiet, natural process invoking subtle renewal and whispering serenity.

3. Repetition of the Letter Nūn (N):

The letter **N** recurs prominently in her poem *Sir al-Ghajar ilā Amīr al-Ghajar* **("The Secret of the Gypsies to the Gypsy Prince"):** (Omar, 2003, p. 23)

"O Gypsies arriving in the caravan of departure
The anklets carved by dances in the steps of departure
So I walked
Above the fringes of resonance
Towards the fringes of the suns
O life suspended in the evenings of the moon
O aged poetry upon lips
We followed its melody reluctantly
And willingly we followed...
Your night immersed in the darkness of my hair
And we followed...
(Your night of life) adorned in skirts that sing"

The letter N appears 85 times in this poem. Analyzing N through its recurrence and poetic whispering:

In *"O Gypsies arriving in the caravan of departure"*, N in *ālātūn* accompanies the notion of continuous movement, secrecy, and sorrow, as if the gypsies are constantly arriving and departing in hidden ways. N whispers subtly, akin to unseen, quiet footsteps.

In *"The anklets carved by dances in the steps of departure"*, N in *naqsh* ("carved") creates repeated sounds evoking the rhythmic, continuous motion of anklets during dance. N functions as a hidden whisper accompanying the movement and rhythm.

In *"So I walked above the fringes of resonance towards the fringes of the suns"*, N in *ar-ranīn* ("resonance") conveys a melodic, light rhythm, enhancing the continuous movement. N links resonance with the suns, turning the journey over "fringes of resonance" into a subtle, ongoing path toward hope. These repeated N sounds resemble poetic whispering, creating a faint internal music that animates the text.

In *"We followed its melody reluctantly and willingly we followed"*, N in *tabiʿnā* ("we followed") and *lahnaha* ("its melody") establishes rhythm. N resonates with obedience and melody, reinforcing the idea of following an inner, hidden sound, whether by compulsion or choice. These resonant sounds resemble inner whispers compelling movement.

In *"Adorned in skirts that sing"*, N in *tanānīr* ("skirts") and *tughannī* ("sing") reinforces imagery of decoration and hidden singing. It conveys the rhythm echoing within the skirts as they move, producing a sense of internal music associated with life, adornment, and song

4. Repetition of the Letter Fāʾ (F):

The letter **F** recurs in Hanin Omar's poem *Sayyidat al-Ḍawʾ* ("The Lady of Light"): (Omar, 2003, p. 73)

'I companioned the darkness of the heart with my depression
Seduced by the cold in the time of ice
I embroidered the edges of my wound with bleeding
I brushed it off with eagerness
All the dreams of intentions for healing
And ended up in my regret...
Seeking exit
And there is no exit
From the mercy of ancient death
On the weeping paths."

The sound **F** plays a pivotal role in shaping the internal rhythm of this excerpt. It signals a suppressed desire to express pain or to escape it. Yet the whispered **F** keeps this desire incomplete, reinforcing a sense of inner conflict. The whisper of F mirrors a hidden psychological state: pain exists but is not openly declared. Instead, it lingers as a continuous, searching murmur that seeks confession but to no avail.

In *"I embroidered the edges of my wound with bleeding"*, F repeats in *aṭrāf* ("edges") and *al-nazīf* ("bleeding"). Here, F reflects delicate, subdued movement, as though the wound itself whispers. The pain is "embroidered" onto the edges in a meticulous but muted way. F adds a steady, restrained rhythm echoing both physical and psychological continuity of pain. This whisper allows the reader to feel pain not as a scream but as persistent, unavoidable murmurs searching for release.

In *"I brushed it off with eagerness"*, F appears in *nafaḍtu* ("I brushed off") and *balahfah* ("with eagerness"). The whispered F conveys an attempt to rid oneself of pain. Yet *balahfah* reveals the attempt's hastiness and impulsiveness, failing to achieve its desired result. This whisper signals an incomplete wager: every effort to shake off suffering remains within the scope of ineffective murmuring, as though pain clings to the soul without hope of confession or healing.

In *"All the dreams of intentions for healing"*, F in *al-shifāʾ* ("healing") represents fragile, fading hope. The whispered F at the end of the word suggests healing is postponed or impossible. This sound adds a tragic dimension to the concept of healing — it is not complete healing but an unfulfilled idea, remaining a whisper inside the poet's dream.

In *"From the mercy of ancient death"*, F in *raʾfah* ("mercy") signifies the quiet, gentle relief death may bring. Here, the whispered F hints that the search for death is not a harsh or loud solution but a calm, subdued one. The F-sound embodies a form of whispered relief or mercy in the poet's pain-filled life — a promise of deliverance, but not a loud deliverance, rather a silent, hidden, whispered escape

3-1-2 Lexical repetition:

- The repetition of words in a poem does not merely create rhythm or melodic flow as letters do; it generates something deeper and richer. It weaves a **temporal extension (prolongement)** of the poetic text, opening spaces beyond the immediate meaning. This repetition produces a gradual **growth (excroissance)**, making the reader sense continuous movement, as if the poem itself is in a state of emotional expansion, similar to waves that accumulate with every rebound.

In this context, the repetition of a word becomes like a continuous pulse, giving the text additional momentum. With each recurrence, the psychological and emotional impact accumulates, creating a sense of cohesion and structural strength within the poem. This echoing enhances not only the unity of the poem but also imparts an epic quality, where the reader engages with each repetition as if participating in ascending emotional rituals. (Tabrmasin, 2003, p. 211)

Ultimately, repetition deepens the reader's relationship with the text. It does not simply make the poem pulsate with musical rhythm but provides a robust structure reflecting continuity and stability, adding irresistible allure and emotional depth.

Repetition of words based on musicalized sounds has been a technical tool used by poets across ages, but in contemporary poetry, it acquires a new dimension, transforming into a powerful artistic device that helps create a specific musical atmosphere in harmony with the poem's intended meaning. Repetition is no longer merely decorative; it becomes a prominent **phonetic technique** that strengthens the philosophical dimensions of the poetic text.

Through repetition, the poet generates a rising sense of symbolic meaning and emotional resonance that transcends the surface meaning of words. Every sound in the text, whether a letter or a word, carries musical energy aligned with the poem's overall rhythm. Repetition thus becomes not just a tool for musicality but a **phonetic technique reflecting a deeper philosophy** underlying the poem's construction.

This phonetic approach in contemporary poetry expresses a philosophy regarding the depth of human experience. It aims not merely to fill linguistic gaps but to convey a sense of temporal extension, continuity of the moment, and repetition of life and experiences, giving the poem dimensions that go beyond mere words into the depth of emotion and sentiment. (Relationships between words exist as sounds; the meaning of the poem emerges more from the construction of sounds than the literal meaning of words. This emergence of meaning is the product of the sound construction). (Al-Saadani, 1987)

In a poetic text, relationships are built not only on the apparent meanings of words but primarily on the sounds they carry. The aesthetic value and deep impact of a poem lie more in the phonetic structure of words than in their direct meaning. This approach transforms sounds into a communication tool that transcends conventional linguistic semantics, allowing the poet to use sounds to generate sensations that resonate with the reader on a deeper level.

In this framework, it becomes clear that the **phonetic structuring of words** is fundamental in building poetic meaning. The sounds, through their repetition and arrangement, can evoke emotions and feelings unattainable by words alone, making the poetic experience deeper and more impactful. This is evident in the repetition of words in Hanin Omar's poetry, as seen in her poem *"Inbiʿāth al-Yāsamīn"* ("The Jasmine's Resurgence"): (Omar, 2003, pp. 57–58)

"The jasmine of my balcony emerged
From my death in my resurgence and its passing
And the greenery spread with its coiled stem in the drought's grief!
It emerged...
After I bade farewell to the color of its flowers
And despaired of all life for no reason!
Is this the jasmine's resurgence???
Or my own resurgence...?
It visited me until I believed in the revolution of death, the brigade
If its scent veered...
And waves of the seas' dreams swept over
Is this the jasmine's resurgence
Or the resurgence of my fingers?
Bleeding became poems
Not written with ink
No...
Not woven by the pen
But...
Inscribed with sighs in the face of pain!
Oh my anguish...
Let it bloom in the soul until I end!!!"

In these lines, the repetition of *"emerged" (inbiʿathat)* and its derivatives expresses continuous whispering. Each recurrence is as if the poet summons the act within herself, gradually reconstructing herself through repetition. The poetic whisper extends beyond mere repetition to an internal renewal process, conveying an urgent desire to emerge from pain and loss.

Each instance of *"inbiʿathat"* carries a different nuance. Initially, it resembles a slow attempt at recovery, an internal whisper akin to returning to life. With each repetition, the tone escalates, suggesting incremental progress toward life—not with outcry or emotional explosion, but with quiet, continuous whispering. This whisper represents a subtle attempt to rebuild the self, reflecting a tension between the desire for life and the fear of confronting reality.

Repetition of *"inbiʿathat"* as a whispered act remains incomplete or uncertain. Rather than a shout of life or an explosion of force, it transforms into a soft echo through the poem's space. The poet seems to be testing the limits of her inner strength, questioning: *"Have I truly emerged? Or am I still in a state of internal death?"*

Here, repetition reflects the poet's tentative stance, using whisper and recurrence to express inner struggle while attempting to believe in the process of resurgence. Hanin Omar's repeated questioning—*"Is this the jasmine's*

resurgence? Or my own resurgence?"—illustrates profound uncertainty. The poet cannot ascertain whether her emergence is real or merely a reflection of nature's resurgence around her. Whisper serves as a vehicle to express these internal doubts, and each repeated question intensifies the search for an internal answer.

Finally, the whisper reaches its peak in *"Oh my anguish... Let it bloom in the soul until I end!!!"* Here, the whisper transforms into an internal call directed at the self. The alternation between resurgence and anguish reflects the poet's surrender to recurring pain. Emergence is no longer a natural act but the soul's resurgence through suffering and anguish. The whisper evolves from a faint sound into an internal scream, yet it remains confined within the self. *"Let it bloom"* conveys a deep desire for the continuous transformation of the self, even if the process is painful.

Through repetition, the poet explores the boundaries of self between life and death, emergence and dissolution, while *"inbiʿathat"* resonates throughout the text as an inner voice narrating a continuous journey from pain to healing, from whisper to muted scream, in an endless cycle

3-1-3 Sentence Repetition:

At this level of repetition, the structure is founded on the first and second levels and relies on the concepts of **"continuity"** and **"prolongement"**. However, prolongement here occurs laterally rather than longitudinally, whereas continuity in existence is an eternal concept unique to the Creator, may He be exalted. In verbal arts, particularly poetry, this continuity manifests through the repetition of elements, starting from the smallest up to the largest, where the poetic verse constitutes the maximal unit. Within this framework, the horizontal repetition of two or three words plays a decisive role in organizing or maintaining rhythm. When this pattern recurs across several verses, it forms a perpendicular arrangement. When **"perpendicularity"** intersects with **"lateral prolongement"**, a phenomenon described as **diffusion** occurs. This diffusion extends beyond auditory rhythm to encompass visual pleasure via literal ornamentation, delighting the ear with recurring motifs and enhancing the aesthetic appeal of the text. (Tabrmasin, 2003, p. 219)

This is evident in Haneen Omar's poem *Sayyidat Al-Matarat*: (Omar, Diwan Bab Al-Jannah (The Gate of Paradise), 2010)

*Ana imra'ah turid al-'aysh 'usfuran *** Fahal tardā turāfiquha janāhāti?*
*Ana imra'ah turid al-mawt sādiqah *** Wa-'āshiqah wa-tāhirah al-ghalālāt*
*Ana imra'ah bila ardh wa-lākinni *** Ilā ḍil'ayka yā rajuli intimā'ātī*

The poetess uses the phrase **"Ana imra'ah"** to repeatedly assert her selfhood, a form of whisper that carries a subtle emphasis on her identity as a woman seeking liberation. This repetition signals a strong desire for alignment with concepts of freedom and emancipation—not only in life but also in death, as she desires to die **"sincere"** and **"passionate."**

"Ana imra'ah turid al-'aysh 'usfuran" clearly expresses the desire for absolute freedom and flight; the bird symbolizes liberation, representing her aspiration to live without societal or traditional constraints.

"Fahal tardā turāfiquha janāhāti?" introduces a question addressed to a man, attempting to create a balance between the woman's desire for freedom and the longing for companionship. The wings symbolize freedom and ambition and challenge the man to accept her as she is.

"Ana imra'ah turid al-mawt sādiqah" emphasizes another aspect of self: the desire to die with sincerity, faithful to principles and values. Death here is not negative; it affirms an honorable, truthful life. Repeating **"passionate"** reinforces love and affection as integral to this self.

"Wa-tāhirah al-ghalālāt" reflects purity or spiritual innocence, which she wishes to preserve alongside her passions and desires. There is a balance between emotion and spirituality; she aims to live and love sincerely and purely.

"Ana imra'ah bila ardh wa-lākinni" expresses spatial non-belonging; she feels unanchored or possibly exiled, a sentiment common in women's literature where the female figure expresses instability or alienation.

"Ilā ḍil'ayka yā rajuli intimā'ā" shifts from spatial detachment to seeking belonging through a relationship with a man. The rib symbolizes protection and closeness; here, the desire is to find a place of refuge in the chosen partner. Her belonging is not to land but to the person who embodies safety and support.

The repetitive use of **"Ana imra'ah"** strongly signifies the poetess's assertion of self in a world that may make her feel lost or alienated. The whispering evokes an internal dialogue with herself and with others—a subtle, silent demand for recognition as a being capable of love, passion, and independence.

Results:

1. **Repetition is a functional structural device, not decorative:**

Analysis shows that repetition in Haneen Omar's poetry is not merely for surface-level rhythm but is a foundational tool that carries semantic and psychological energy, contributing to a richly emotive poetic space .

2. **Poetic whisper as a distinctive feminine expression:**

Repetition combined with whispered sounds (like L, T, F, N...) produces what may be termed **"poetic whisper,"** a stylistic expression aligned with the hesitant, contemplative, and reflective nature of the feminine voice confronting reality, self, or others .

3. **Literal repetition as a means to reinforce affective intensity:**

Statistical and close reading confirms that repeating whispered letters, especially in highly emotive contexts, imbues the text with an internal lyrical quality, enhancing psychological rhythm over overt musicality and reflecting affective states such as alienation, fragility, nostalgia, and emotional anguish (**Word repetition reflects inner tension and emotional dynamics:** Word repetition in Haneen Omar's poetry prolongs the internal temporality of the text, creating an accumulative emotional effect that enables the reader to engage progressively with the poetic scenario, reinforcing textual unity and internal musicality .

4. **Sentence repetition as a tool for building ascending emotional rhythm:** Reading shows that sentence repetition, particularly during self-assertion moments (as in **"Ana imra'ah..."**), grants the text emphatic and metaphorical dimensions, reflecting internal turmoil or the quest for recognition and existence, highlighting the poetess's socio-personal experience .

The poetics of repetition in Haneen Omar embodies an existential philosophy in writing: Repetition in her poetry is not merely a phonetic technique; it reveals an internal philosophy of contemporary female experience, turning poetry into a space for rebirth from pain and reconstruction of self through writing. Repetition thus becomes a secondary voice of the poetess, as significant as explicit meaning .

Abstract

This study investigates the aesthetic and cognitive foundations of the dual relationship between poetry and writing in the poetics of Ibn al-Muʿtazz, one of the central figures of early Abbasid literary theory. It explores how poetic creation and the act of writing intersect within the framework of rhetorical construction, stylistic balance, and cultural consciousness. Through a textual and hermeneutic reading of Ibn al-Muʿtazz's Kitāb al-Badīʿ and selected poetic texts, the research highlights how the poet conceptualized the mechanisms of creativity as a dynamic process of composition, reflection, and self-awareness. The paper argues that the duality of poetry and writing in Ibn al-Muʿtazz is not a simple juxtaposition but a dialogic interaction that fuses spontaneous inspiration with intellectual craftsmanship. This interaction produces a unified poetic discourse in which rhythm, imagery, and linguistic refinement coalesce to construct meaning and aesthetic pleasure. By situating Ibn al-Muʿtazz within the broader Abbasid intellectual milieu, the study demonstrates that his poetics anticipates later critical debates about the nature of authorship, creativity, and the aesthetics of textual production in Arabic literary tradition.

Introduction:

Poetry/Writing constitutes a concordant duality of function, performance, craft, and vocabulary a phenomenon deeply rooted in the world of the Arab poet and his milieu since ancient times, particularly in eras of civilization and urban flourishing. In such contexts, the poet engages the recipient in the act of reading, refining what he composes with deliberation, steadiness, and striking mental presence. He forges connections among carefully chosen elements to convey his experience, blending the instruments of poetry with the components of writing in a balanced act of productive reading and composition. This process unveils an evolution of thought, far-

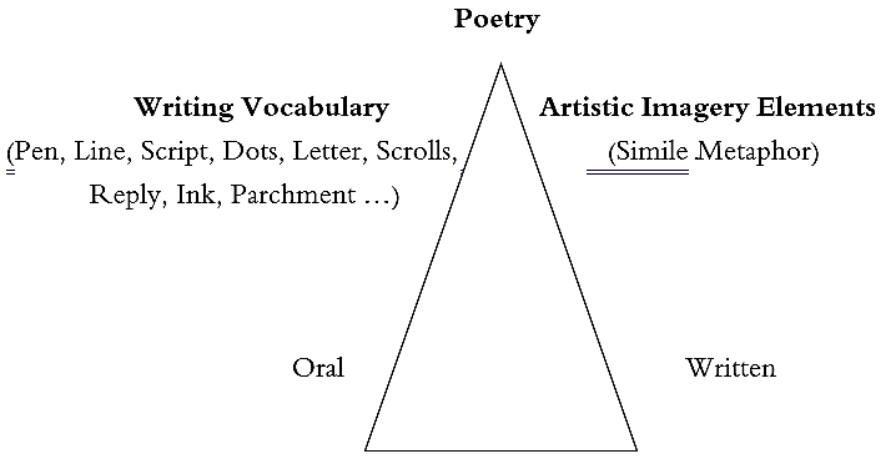
sightedness, eloquence, and expansive awareness and culture. It reveals the poet's dedication to endowing his creation with a unique flavor through his artistic descriptive language, articulated within diverse structures that shape the hierarchy and articulations of discourse.

This phenomenon flourished in the realm of composition during the post-Islamic eras through a subtle interweaving that reflects the poet's profound understanding and perception of his own essence and the surrounding world in all its components of sky and earth alike. Through this, the poet despite the scarcity of material presents his vision in a marvelous depiction of things. These are perspectives on significant stations of human existence, carrying deep resonance in the soul, which we seek to read, examine, and interpret just as the poet himself first perceived them by tracing the indicators and features that aid us in identifying the gaps, probing the network of relations among the units constituting the poetic text, and pausing upon the framework of the poetic image and its fundamental structures.

Thus arises the core problematic, which is the very locus of tension within this partnership, intersection, and articulation in the geography of shaping the body of the text. It can be summed up in the following questions: What is the nature of the Poetry/Writing duality? What are the elements that constitute it? How does the poet/writer achieve the necessary balance among the various functionally diverse components of construction? And to what extent did Ibn al-Mu'tazz succeed in offering a fully integrated image of remarkable harmony and coherence, serving as a model for a unique partnership of creative production, in light of the artistic, intellectual, and cultural capacities required by the process?

1 – Poetics/Writing: Reality and Models

The researcher of classical Arabic poetic texts particularly those associated with the post-Islamic period during its radiant golden ages discerns that functional relationship between the instruments of oral poetic artistry and the vocabulary of writing, expressed in the most exquisite imagery and the finest elaboration through familiar modes of metaphor. This is especially evident in depictions of nature, whether in the nasib such as ruins (atlal) or in themes of nasib, journeying, and pride, as in portrayals of animals and birds. (al-Din, Hasan al-Banna Izz, 2003) It also extends to other purposes connected with the human being/poet himself, both in peace and in war. This relationship is illustrated in the following schema:



A Unique Creative Experience

To illuminate the features of this interweaving in the phenomenon of the composite craft "Poetry/Writing", we present a number of examples. Here is Abu Tammam who, in the intensity of longing and ardent desire for the Other, imagines himself as a "line" within a letter ("poem"), so that he might be present before the Other (the beloved/reader): "He is read as imagined writing, his poetry standing in place of actual writing." (al-Din, Hasan al-Banna Izz, 2003, p. 237) He says: (Tammam, 1999)

Had I the power, I would have inscribed my passion and longing for you;	**	Instead, I became a line within my book.

It is the burning passion for the beloved, to the point where the oral becomes writing—an imaginative inscription with its impact, presence, and influence through the units (katabtu ... satran ... kitabi). In this lies a hidden feeling and a veiled mental awareness that channels the psychological state into a realm of present vision, embodying the suffering and transmitting it literally to the Other, urging a response and realizing the desired union.

It is the very same experience endured by al-ʿAbbas ibn al-Aḥnaf, until the features of love appeared to him on the forehead as though inscribed upon parchment. He says: (al-Ahnaf, 1954)

Love has written upon my forehead a book,	**	Clear, like writing upon parchment.

And another poet, following the same path, declares:

I wrote—yet if only my fingers could ** Depict me as a letter reaching you in my book.

Here, the units (katabtu ... harfan ... kutubi) correspond with "depict me", uniting writing and speech as a sign of the poet's central focus: touching the depths of the human soul (the Other) through a unified act and a craft of parallel activity. This achieves interaction between the outward and the inward, the external and the internal, wherein the self emerges as a complete, unique, and captivating whole.

The vocabulary of writing, which the poet employs from time to time across different purposes of his poetry, and in diverse contexts with knowledge, awareness, and foresight carries meaning and impact in affirming the self and establishing existence. Researcher Ḥasan al-Banna ʿIzz al-Din states: "For written consciousness implies what Ong calls a 'turn inward'." (Ong, 1994) Ong further clarifies: "Although human existence means being a person and thus unique and unrepeatable, the growth of historical knowledge has shown that the way in which a person feels about himself in the universe has developed in a patterned manner through the ages." (Ong, 1994, p. 306)

Thus, the phenomenon of poetry/writing reflects the poet's consciousness, maturity, and the completion of his self in feeling, thought, and composition. It is a consciousness that arose within the folds of history and the diverse circumstances of life, in direct contact with the Other and with the surrounding world. This compels the poet constantly toward growth and development, enhancing his capacity to express and articulate himself in affirmation of his existence and in response to his audience.

This consciousness, as Ong (quoted by ʿIzz al-Din) describes, is distinguished by "the growth of a concern capable of expressing itself within the individual's interiority, as a being apart from collective structures though not necessarily separated from them structures which inevitably encompass every person. Self-awareness, in its temporal and spatial extension, is equal to humanity: whoever can say 'I' possesses a sense of self. Yet the reflective capacity and the ability to articulate the contents of the self require time to grow." (Ong, 1994, p. 71)

The experience here thus represents a developed system of structure, imagination, and craft that fuses the units of oral form with the vocabulary of written form in a distinctive figurative, phonetic, and literal expression.

In this regard, the khamriyyat (wine poetry) of Abu Nuwas offer vivid images of this blending between the oral and the written, reinforcing the phenomenon, highlighting its dimensions, and showcasing the elevated consciousness of its author. He says, while in the company of a companion in a tavern, describing the scene and portraying the state of his comrade absorbed in wine: (Nuwas, 1999)

He brought his cheek close to the jugs,	**	And laughed with joy at the wine's sparkle.
He poured, and it revealed itself, then mingled, and	**	Eight little waws, smiling upon the line.

inscribed—		

Researcher Hasan al-Banna Izz al-Din comments on the two verses, saying: "There is no doubt that the laughing waws correspond to the joy of the companion, while they also soften the 'frown' of the wine when it responds to the poet's question as to whether it had been contained by Khosrow ('it frowned'), accusing him of lack of patience, since it had heard of Dhu al-Qarnayn before his departure, and had perceived Moses before his companion al-Khidr. Thus, the eight laughing waws (equal to the number of metrical feet in the verse itself), though written against their will, are nevertheless 'laughing,' and therefore seem closer to the destiny of man, where laughter mingles with frowning, and life with death ..." (al-Din, Hasan al-Banna Izz, 2003, p. 245)

It is the irony of fate that reveals certain truths of life in a grimly comic scene, through the juxtaposition of opposites that have become proximate, until the two contraries appear as two sides of the same coin in an age where distinctions have dissolved to the point of disappearance.

And although the literal inscription of the "waws" remains fixed, it has kindled the poet's imagination and assisted him in conveying his vision and embodying his perspective, owing to their richness of connotation and depth in representing hidden meanings. For this reason, he repeatedly employs them in various places to highlight the features of the passing moments that seize him as poet/writer. Thus, here he is, drinking aged and blended wine, when he says: (Nuwas, 1999, p. 289)

It leaps when touched by the strike of mixing,	**	Just as grasshoppers leap in the noonday heat.
And it adorns itself with pearls from its swirling folds,	**	Which, in their mingling, resemble the shapes of waws.

Numerous are the exquisite verses in Abu Nuwas's craft of simile, where he relies on letters or signifying units from the lexicon of writing. Such similes reveal wit, ingenuity, and depth of reading, especially when it comes to blending things that are either proximate or even far apart, in order to shape an image according to a distinctive vision. Hasan al-Banna ʿIzz al-Din, in his reading of the two verses, explains: "The comparison of the leaping of wine its mixing and bubbling to the leaping of grasshoppers suggests the sexual connotation inherent in the root (naza) as found in Lisan al-ʿArab. Yet the wine itself also has its 'nawazi', which are its jandaʿ (with ʿayn) when it is mixed. The jandaʿ is a black locust with two long horns, and it is the largest of the grasshoppers though it may also be the smallest, according to Lisan al-ʿArab (entry: jandaʿ). Thus there is an implicit competition between the midday grasshoppers and the wine's jandaʿ in their 'leaping,' which in turn produces 'pearls' that rival the poet-writer's 'waws'." (al-Din, 2003, p. 246)

These are the traces of the written dimension in portraying the present scene and revealing its depths, whether consciously or intuitively. And here is Abu Tammam, who, within the context of war, sketches the features of the patron's courage and valor, extolling the sword and what it wreaks in striking terror into enemies. He says (Tammam, 1999, p. 372)

You wrote their faces with strokes of draft and art,	**	With blows and thrusts that pierced the proudest heart.
A script eternal, ever read, yet not by pen—	**	No lam nor alif traced those lines of men.
And if they cling to denial, still remain,	**	Their faces pages, inscribed with what you have slain.

He employed writing-related vocabulary (katabtu ... kitaba ... maqru'a ... khattattu ... la ma wa-la alifan) in a way that renders the image more precise in conveying the event. The enemies' faces once struck and pierced by swords were disfigured, their features altered, until they resembled a page inscribed with lines of shame, humiliation, defeat, and collapse. These are traits of an implicit reading from which one may discern numerous hidden meanings within the field of war.

This is akin to what al-Mutanabbi achieves when he extols the patron in his most magnificent portrayals of heroism and combat. He says: (al-Mutanabbi, 2014)

The knights' spears are turned away by his mail,	**	A rain of lances pours, yet it prevails.
The lofty blades trace lines but pierce it not	**	As though each spear were but a pen it wrought.

The shield of the patron is battered by the enemy's spears from every side, yet it neither kills him nor wounds him. Here, the poet/writer sharpens his gaze upon the scene: the tips of those spears appear to him as pens writing upon parchment, leaving their marks without piercing it. Implicitly, this suggests victory and dominance not for the enemy, but for the patron, in his steadfastness, pride, dignity, and resilience.

The combination of vocabulary drawn from nasib, wine, war, nature, and the lexicon of writing, among certain distinctive poets of the flourishing ages, demonstrates their concern to elevate the artistic and aesthetic dimensions of their craft making them deeper, subtler, and more elusive in order to captivate audiences. This compels recipients to mobilize their intellectual capacities, mental energies, and cultural competences in the act of reception, thereby participating actively in generating implied meanings (the unspoken), as a directed contribution toward achieving the poet's purposes.

This, indeed, is the essence of poetics, especially when interwoven with the tools of writing. The act of composition then acquires a special nature, a distinctive taste in rhythm, vision, and concerns, revealing the stance of the poet as a human being toward the world, society, and existence across time and space. In the view of Abu Dib, it is the act of the gap: the space of tension within the domain of colors and the architecture of environmental form. He observes that "the importance of place and time in poetics and in the history of poetry springs from this very structure: every poetics is nothing more than an exploration of relations that situate themselves in space, in time, or in both. In certain ages, poetics inscribes itself through its passion for either one of them or for both together." (Dib, 1987)

Adonis, for his part, emphasizes the effect produced by the blending of poetics and thought in Arab creative production, identifying the intellectual dimension of poetry at four levels. First is the poetic image that unveils the obscure and hidden within man, revealing what the reader senses or contemplates without yet recognizing, offering him keys and means of insight into his inner world, allowing him to understand it more fully. Second, this image discloses the essential dimensions of the external world, uncovering what had been repressed, unknown, or neglected, creating in its presentation questions that point toward other truths, expanding the scope of knowledge and breadth of experience. Third, these revelations and questions, transmitted through reading, shift from the domain of emotions to the domain of comprehensive structures, transforming the aesthetic into the existential and intellectual, and the personal into the universal and collective. Fourth, among these revelations are some that rise to the level of serving as keys to an unknown, or as foundations for the construction of new conceptions that had not been anticipated. (Adonis, 1984)

2 – Ibn al-Mu'tazz the Poet/Writer:

Abu al-'Abbas 'Abd Allah ibn al-Mu'tazz was born in 247 AH / 861 CE in Samarra. He grew up in a house of power, prestige, and sovereignty. He was educated at the hands of the masters of language and eloquence in Basra and Kufa, and he heard rare expressions and the pure language from Bedouin arrivals. He immersed himself in the heritage of the ancients, in what had been translated of science, literature, and philosophy, and in the sciences and literature of the Arabs, until his growth was complete and he rose to his stature, becoming a source of admiration and pride (Ibn al-Mu'tazz, 2000). He wrought marvels both in poetry and in writing. Abu al-Faraj al-Isfahani says of him: "Among the caliphal princes who excelled in art and literature was Abu al-'Abbas 'Abd Allah ibn al-Mu'tazz, who surpassed and outshone all the people of his age in virtue, nobility, literature, wit, and mastery of every branch of learning." (Adonis, 1984)

He is the crown of caliphs, the creator of delicate poetry in descriptions and similes. It was he who said: "If I were to say 'as though' and not follow it with a simile, may God shatter my mouth." (Adonis, 1984, p. 166) At

the same time, he was a man of the pen, devoted to writing and composition, following in the footsteps of his teacher Ja'far ibn Qudama the poet-writer until it was said of him: "He was the most poetic of the Hashimite princes and the most accomplished in prose throughout the Abbasid state. His similes were beyond comparison or likeness, and his descriptive poetry beyond the reach of imitators." (Adonis, 1984, p. 168)

He traces the object of description in motion and stillness, in heaven and on earth, with measured doses of conscious emotional sensitivity that grant him the ability to select the building blocks of his enchanting and compelling artistic architecture. Thus, gazing intently with passion at raindrops as they touch the earth, he says: (Ibn al-Mu'tazz, 2000, p. 69)

She hastened, gifting earth a youthful gown,	**	A Rajab rain, its pouring wins renown.
Its earliest drops were scattered, as though they were	**	Quick-drawn dots upon a book's interior.

He says, observing the swords as they tremble: (Adonis, 1984, p. 67)

The swords, when shaken in the heat of fight,	**	Were like leaves trembling at the falling rain.

He is the poet as phenomenon, the innovator of beautiful images that captivate the soul. He describes in order to portray, as a sensitive and skillful poet, and he scrutinizes in order to deepen, as a writer of profound reflection. This is the very nature and disposition of Ibn al-Mu'tazz, the poet/writer, rooted in his penetrating vision of life's horizons where mastery of language, breadth of imagination, delicacy of sensibility, sharpness of observation, and keenness of intellect all converge.

Poetic Aesthetics of Writing Elements in Ibn al-Mu'tazz: Mechanisms and Dimensions

The reader of Ibn al-Mu'tazz's poetry encounters many signs of writing: traces of script, units of composition, and elements of inscription that constantly accompany artistic formation, contributing to the solidity of structure, the beauty of fused expressions, and the expansion of semantic capacity. This bestows upon the text a distinctive aesthetic quality, born of a deliberate harmony between reason/reality and emotion/imagination, in a duality of composition nourished by knowledge, underpinned by science, and guided by awareness and refined sensibility—especially within the Abbasid poetic tradition. It represents a special model that elevates the poet to a level of eloquence and culture granting him the power of penetrating vision and captivating aesthetic depiction. Thus, he penetrates the realm of existents, probing their truths, uncovering their hidden recesses, and revealing their secrets. How could it be otherwise, when he is the poet-human intelligent, astute, and embodying the highest degrees of poetic knowledge? Here, as Hasan al-Banna Izz al-Din asserts, "Poetry must be sought at the very heart of the relationship between poetry and science, not at its margins. Poetry is knowledge, acumen, awareness, perception, and feeling." (al-Din, 2003, p. 129)

A pioneering experience emerges interweaving the reservoir of knowledge, both poetic and written, with perspectives drawn from the map of existence, to delineate the dimensions and features of a geography of place. These often appear before the poet in tangible forms or vivid images, stirring his material imagination, challenging his intellectual capacities, and serving as a stimulus for crystallizing visions, translating ideas, and deepening understanding. To embody this, our poet resorted to a set of mechanisms as building blocks of his artistic architecture, in response to the yearning for beauty and delight among recipients. We shall follow them through modeling and interpretation.

3 – Manifestations of the Aesthetics of "Poetry/Writing" in the Poetry of Ibn al-Mu'tazz

3.1 – Writing and Ruins / Hearthstones of the Abode

Time has played with things and beings, ravaging them mercilessly, altering their features, erasing their signs, and making them prey to decay and obliteration. This is especially so with the remains of a dwelling once abandoned by its people just as in the pre-Islamic tradition where the image of ruins takes form in a scene

resembling script or writing upon an open manuscript. Ibn al-Mu'tazz, lamenting the tyranny and power of time, says: (Ibn al-Mu'tazz, 2000, p. 327)

He cursed the age for a ruined trace,	**	Between al-Mushqar and al-Safa's place.
As though the hands of passing nights had spread,	**	An open Qur'an, its pages widely read.

In his reading of the scene/image, the poet appears deeply disturbed and discontented with the workings of time and its tyranny, for it possesses an overwhelming power and eternal decrees by which all existents, in its course and recurrence, are transformed into traces and remnants occasions for reflection and admonition. This compels the poet to contemplate them closely, regarding them as writing/signs pointing toward the destiny of man upon the earth (al-Din, 2003, p. 174). The poet's very effort in composition is but a reading of this writing upon the open mushaf/earth, after examining its symbols and probing the truth of human fate—something that kindles in the self feelings of helplessness, weakness, and surrender.

The poet continues to employ the mechanisms of writing, interrogating the hearthstones of the abode, and evokes the letters with deliberate reference to their "dotting." He says: (Ibn al-Mu'tazz, 2000, p. 39)

Pass by the dwelling where we once abode,	**	It changed so much since our familiar road.
All else has vanished—save for three that stay,	**	Like dots of tha' upon its script alway.

Here the grim truth of the scene is revealed the place, the ruin, whose features have been effaced and from which movement and life have departed. It now lies heavy upon the earth in an ominous form, a source of misery, a mark of weariness, and a cause of hardship, affliction, and dread embodied in the three hearthstones that correspond to the dots of the letter tha', signifying ill omen and misfortune. (Ibn al-Mu'tazz, 2000, p. 19)

It is a dark image, conveying a heavy burden of sorrow and distress, in a moment of anguish over a bitter fate. The poet, journeying on his camel, follows the traces of landmarks upon the earth with patience, endurance, and profound thought, acknowledging the power of the heavens over the earth and surrendering, in the end, to the Almighty. He says: (Ibn al-Mu'tazz, 2000, p. 40)

A she-camel cast into a desolate waste,	**	Burdened with grief that stirs while others rest.
She leads the caravan upon its way,	**	Like "Bism" inscribed on her book each day.

3.2 – Writing and Nature

Nature has always been, and continues to be, a space of captivating beauty, a realm of splendor and radiance. It adorns the universe and illumines it, sketching upon its surface the most wondrous images in the most marvelous forms and colors. Thus it becomes a site of attraction, inspiration, and profound influence for poets enchanted by the charm of its dazzling manifestations, the loveliness of its enchanting scenes, and the marvel of its stirring spectacles, both in the heavens and upon the earth.

Ibn al-Mu'tazz, the poet/reader/writer, describes lightning, exulting in his emotional response as though in the act of reading the writing of the sky: (Ibn al-Mu'tazz, 2000, p. 244)

I lay awake for lightning's ceaseless gleam,	**	Its darts like falling stars in endless stream.
As though its brilliance in the vaulted sky	**	*Were lines inscribed with liquid gold on high.*

He also says of it, as the poetics of writing surged within him: (Ibn al-Mu'tazz, 2000, p. 325)

The lightning seemed a reader's holy book, ** ***Now closing once, then opening with a look.***

His gaze extends to the crescent moon, in awe at the drawing of the sky, as he says: (Ibn al-Mu'tazz, 2000, p. 251)

Behold the crescent's beauty, as though it were	**	A gilded "nun" on turquoise clear and fair.
And see its stars, like single daffodils that rise,	**	Above violet fields, blooming in the skies.

And in the course of observing the manifestations of nature and the sky, a great cloud appears before him, about to pour down rain, becoming a source of blessing, goodness, and bounty. He says: (Ibn al-Mu'tazz, 2000, p. 502)

It came at dawn to clothe the earth in youth,	**	A Rajab rain, whose pouring speaks of truth.
Its earliest drops were scattered as they fell,	**	Like hurried dots upon a book's fair shell.

He continues his experiences with the wondrous creation of the sky, to have a stance with the night, looking intently with deep focus, as the dense darkness captivates him, and a vision of the scene bursts forth before him in a strange and striking image. He says: (Ibn al-Mu'tazz, 2000, p. 599)

The darkness added a meaning to the nun of his poetry,	**	So it lengthened, and without that it would not have taken the jarr.
And his eyebrow was the protecting nun, preventing,	**	According to its condition, the act of the eyelids from breaking.

It is part of our poet's visions and his readings of radiant pages from the wondrous scenes of the sky, which poets have continually pursued and observed at all times for knowledge and reflection. And just as writing translates nature with all its marvels and grants it a beauty that imagination cannot fully embody, so too does nature, in turn, provide the creative poet keenly aware and perceptive of the things around him with supportive tools, through the names of its various phenomena, to expand his vision, refine the drawing of forms, angles, and points of contact with the realm of existence. Thus the scene for him shifts from writing/nature to nature/writing, and Ibn al-Mu'tazz "sees writing and its lexicon through nature and its vocabulary ..." (al-Din, 2003, p. 197)

This is the case in the pairing of "the notebook" and "the bow," where his focus rests on the craftsmanship and proportionality between them, as though the notebook had been made by man from nature and then turned into another state. (al-Din, 2003, p. 198) He says: (Ibn al-Mu'tazz, 2000, p. 565)

Here it is, brocaded, adorned with decoration,	**	Woven by fingers with every weave.
In a form that takes the empty letter,	**	As though its lines were branches of thorns.

From this, the poet-writer-reader produces something akin to a disturbance that transforms one thing into another, in light of what nature provides in terms of active elements that embody meaning and convey the idea in a marvelous and astonishing way. "The craft of the notebook and what is written in it of lines becomes confused with the nature of thorny branches" (al-Din, 2003, p. 198) an allusion to the difficulty of composition and the severity of its labor pains, a translation of the fruits of the mind. This requires the availability of a reservoir of knowledge and culture, as well as a mental presence capable of comprehension and understanding. This is what researcher ʿIzz al-Din points to in his statement: "This reciprocal written consciousness between nature and writing, if one may say so, is what bestows particularity upon Arabic poetry especially after Islam and the establishment of Arabic writing and poets' assimilation of their world through their poetic craft and their

human awareness alike. This reciprocal written consciousness between nature and writing, if one may say so, is what bestows particularity upon Arabic poetry especially after Islam and the establishment of Arabic writing and poets' assimilation of their world through their poetic craft and their human awareness alike." (al-Din, 2003, p. 197)

3.3 – Writing and Wine Companionship

The Abbasid era the poet's milieu was an age of civilization, openness, and mingling among peoples and races. In it, some people immersed themselves in wine-drinking and excelled in establishing gatherings of conviviality and companionship, providing all forms of luxury, ease, and refinement. The poet often attended such moments of intoxication, overcome with feelings of play and libertinism, and would break forth into recitation, observing those occasions and describing the scenes that appeared before him in the most exquisite depictions and representations.

Ibn al-Muʿtazz, describing the one who pours them wine, says: (Ibn al-Mu'tazz, 2000, p. 124)

By the hand of a gazelle with lock and tress,	**	With two sideburns like two qafs at the ends of a line.

The "cupbearer" here is likened to a graceful, elusive gazelle that is quickly domesticated especially through his face, with its lock and tress, and two sideburns like the two letters qaf placed at the edges of a line (al-Din, 2003, p. 242)

In this appears the precision of observation and the depth of reading the scene through carefully following its sensory details, with attentiveness and remarkable mental presence. This summons the active element of clarification the mushabbah bihi (the object of comparison) from among the letters of writing, carrying the same qualities of the image and fully conveying the intended meaning.

Our poet continues to shine in the realm of refined literary imagery, seeking his similes in the sounds and letters of writing. He says in another place, observing the face of the cupbearer: (Ibn al-Mu'tazz, 2000, p. 228)

And traced above the pearl-like veil his mustache,	**	Like half a Ṣad, and the curve of the temple like a Nun.

Observation: Here Ibn al-Muʿtazz, the poet/thinker, perceives the meanings of the shapes of letters of writing and their differing formal significations rising and descending, extending, curving, and circular. He evokes the Ṣad, using half of it to represent the line of the mustache, and he evokes the Nun to represent the roundness of the temple of the face. In this he shows firmness and stability in the signification of his choice, whether in personification or concretization, especially when it concerns the very object being described.

He says, describing the temple of the cupbearer's face: (Ibn al-Mu'tazz, 2000, p. 231)

He curved his temple like a Nun beneath a forelock,	**	Held fast, adorned by the ivory of his brow.

It appears that our creator this "conscious calligraphic painter" has involved both the Qaf and the Nun, signifying their qualities of containment and fullness. For the two temples, being like two Qafs at the ends of a line, suggest the cupbearer's ability to serve those sitting near or far. Likewise, the "curving" of the temple and its circularity "like a Nun," in the last two verses, suggest the graceful movements of the cupbearer, reminiscent of the gazelle in the first verse. (al-Din, 2003, p. 242)

Thus, the poet's images and similes manifest themselves through the shapes and forms of the letters of writing, which draw their frames and boundaries and reveal their functional dimensions. The Alif, for example, was named Alif because it brings all the letters into harmony aligning and joining with them in structure and weaving. In its form, it resembles an upright column, corresponding to all that is similar to it in height, such as a man standing. And so Ibn al-Muʿtazz says, in describing the figure of the cupbearers: (Ibn al-Mu'tazz, 2000, p. 218)

As though the cupbearers among the drinkers	**	Were Alifs standing upright upon the lines.

The scene of the cupbearers standing in service of the drinkers, who are seated in a row, each according to his state, movement, and reaction to what is taking place around him, resembles the columns of a mosque that rise upright, between which the worshippers line up in prostration or bowing. (al-Din, 2003, p. 243)

3.4 – Writing / Animals and Birds

Just as Ibn al-Muʿtazz was preoccupied with the manifestations of nature and the sky, he also closely observed what occurs in the earthly realm of nature, with attentiveness, steadiness, and far-sightedness particularly regarding animals and birds. These appear in vivid scenes where writing, through its various associations, intertwines with what the poet encounters among animals and birds in a meaningful way. He thus presents refined models of correspondence, parallelism, and analogy, achieving aims that deepen the semantic weight and broaden its scope through contemplation, perception, and knowledge.

- **Writing / Animals**

In the context of animals, our poet offers descriptive, contemplative, and striking depictions, which belong to the very core of authentic Arab imagination in the field of ṭard (the hunt). He describes a female dog, saying: (Ibn al-Mu'tazz, 2000, p. 254)

We drove against the eyes of wild beasts and gazelles,	**	A dire creature, dreaded to encounter.
Raised high, like a dark scorpion,	**	Sharp and swift, with loosened entrails.
As a stroke from a black pen,	**	Or a fringe from the edge of a cloak.

In this context, our researcher ʿIzz al-Din, in his valuable work Al-Shiriyya wa al-Thaqafa (Poetics and Culture), cites an example from the rajaz of Ibn al-Muʿtazz in describing nature with the presence of gazelles. He says in it : (al-Din, 2003, p. 275)

I saw a herd of gazelles	**	In a fresh, verdant meadow.
Their gloom was lifted by what the water's moisture caused to grow,	**	So they departed without weariness.
I likened them, from afar,	**	To a stroke from a black pen.

She is content with blood instead of flesh.

And he comments on this by saying: "The removal of the 'gloom' from the herd of gazelles in these verses is not achieved except by 'distance' from them, with enough space to imagine them through the movement of the stroke of the pen. And this stroke is nourished by the blood of flesh, which suggests the 'activity of the gazelles' departing from the meadow, likened by the poet in a 'scriptural' manner." (al-Din, 2003, p. 204)

A simile that contains indicators revealing the precision of Ibn al-Muʿtazz's thought, his far-sightedness, and the depth of his vision of things—something that enables him, as poet-writer, **to embody them in marvelous images blending writing and animal.**

- **Writing / Birds**

And just as he introduced writing into the images of animals by way of comparison and analogy to delineate the features of the scene through elements of intersection between the two, revealing the closeness and similarity that make it possible to read what occurs, even mentally, in the world of simile, especially when it is most precise, he also employed some mechanisms of writing in the images of certain birds, such as in his description of the falcon. He says: (Ibn al-Mu'tazz, 2000, p. 469)

A falcon that understands the speech of the speaker,	**	Compact of head, majestic of shoulder.
With curved talons, eager and swift,	**	As though they were nuns of the scribe's hand.
With a breast adorned in fine embroidery,	**	Like the beginnings of the lam-letters on parchments.

And in his description as well, he says: (Ibn al-Mu'tazz, 2000, p. 468)

With a curved talon like the nun of the scribe,	**	And a breast adorned in fine embroidery.
Like the traces of pens upon the parchments,	**	Or like the remains of kohl in the eyelids.

And in the same context, researcher ʿIzz al-Din, while analyzing this subject, included verses by our poet that highlight his incorporation of writing into the image of the hawk. He notes that "he has combined night and morning, while at the same time separating them, in the same way that the lives of the birds hunted by the hawk are separated from their bodies." (al-Din, Poetics and Culture, 2003) Ibn al-Muʿtazz says: (Ibn al-Mu'tazz, 2000, p. 394)

As though, when we had traveled a farsakh,	**	And morning had risen proudly in its east,
While night had settled firmly in its west,	**	It was a manuscript of a scribe, in the most precise copy

And our researcher observes: "This image, upon reflection, contains a description of the precision of the hawk's colors between black and white and the exactness of their arrangement in its form. And there is no doubt that the context in which the poet has placed it here makes the hawk closer to the 'craft' of a scribe, seized by awe and solemnity as he scrutinizes his copies." (al-Din, Poetics and Culture, 2003)

In all the examples we have presented, Ibn al-Muʿtazz remains the distinguished poet-writer who demonstrated superiority in the field of writing-consciousness. Through what writing provides in the domain of composition/art in terms of tools of coloring, shaping, and imaging, he effectively contributes to the depiction of the realms of existents and the determination of their features.

CONCLUSION:

The duality of Poetry/Writing or what ʿIzz al-Din calls "poetic/written consciousness" constitutes a central and fundamental nucleus with significant efficacy in the process of reading the artistic formation of the elements of the universe and the realms of the self. It opens a wide horizon for the conscious, inspired poet-writer to perceive nature and the world around him.

Among the most important findings of this research in light of this duality/partnership are:

Poetry/art has found in writing, with its arsenal of composition and documentation, the means to invest in this field, expanding the scope of imagery, artistic architecture, and the imaginative dimension. This enables the poet to discover various expressive tools and elements necessary for translating his ideas and embodying his visions.

The contemporary experiences of the Arab poet shaped by the circumstances and transformations of life require knowledge, culture, and science that broaden his horizons, enlighten his thought, sharpen his imagination, and deepen his vision of things. This makes him more aware and perceptive of the fluctuations occurring in his life and environment, which demand emotional flow and mental presence with keen insight and sharp intelligence.

The universe, with all its components, is a space brimming with movement and life especially its enchanting natural phenomena, marvelously crafted, which have always been a source of inspiration, admiration, and

wonder. They awaken in poets aesthetic visions that transcend reality with boundless imagination, shaping the emotional dimensions of the poet in the geography of fine art.

The artistic tableaux in the poetry of Ibn al-Muʿtazz in light of this interweaving are the outcome of passion and love for nature and its captivating manifestations, and thus of observation, contemplation, deep reflection, and prolonged thought on all beings and existents that fill the universe. They are stations of knowledge, science, and culture through which our poet invests his abilities, skills, and creativity in depiction and composition to paint a mosaic of wondrous craftsmanship of the intellect and rhetorical beauty. His richly compounded reservoir infused with art, philosophy, and far-reaching visions grants poetry a wider space, a deeper dimension, and a broader field for reading, discovery, and interpretation, with the hybrid text offering surprises filled with fascination, delight, and profound psychological passion.

Ethical Considerations

This research was conducted in compliance with ethical academic standards. All textual sources analyzed are published works of classical Arabic literature; no human participants or private data were involved, and therefore no ethical approval was required.

Acknowledgment

The author wishes to express sincere appreciation to the Department of Arabic Language and Literature and the Laboratory of Language Sciences at Amar Telidji University of Laghouat for their continuous academic and institutional support.

Funding

This study did not receive financial assistance from any funding body, governmental organization, or private institution.

Conflict of Interest

The author declares that there are no conflicts of interest related to the research, authorship, or publication of this paper.
